As an illustration, a milling machine, in which the knee and upright do not stand exactly square will produce work that is out of square. This, it is readily seen, is a decided objection when working on such pieces as jig castings. If such a casting is milled on a machine wherein the knee and upright are not exactly at an angle of 90 degrees, much time is consumed in scraping the finished piece to bring it square. Again, if a drilling or boring jig is bored on such a machine, it is readily evident that the bored holes will not be parallel with the surface from which the jig was located for boring. Therefore the first point to consider in efficient toolroom work is to make sure that only first class tools are installed.

Time was when one toolmaker did all the work on one tool, say a jig for instance. He planed the base casting, bored the holes for the bushings, turned, hardened and ground the bushings, made the small parts, such as latches, feet, special screws, clamps, etc., and then assembled the complete unit. While this practice resulted in an excellent finished product, a comparatively high labor cost was involved, due to the fact that much of the work could have been done by men who, while not thoroughly skilled in the whole art of toolmaking, possessed sufficient skill to make many of the necessary parts. At the present time, in some plants, it is customary to have one man make a complete unit but better and cheaper results are derived by dividing the work among several departments.

Machining Jig Castings

Castings for jigs and fixtures, die bolsters, blanks for blanking dies, etc., can be finished to advantage on the planer, shaper or milling machine. A man who spends all his time at this one class of work becomes highly proficient. Considering the planer and shaper first; these tools are admirably adapted for the work in question. About all the equipment needed for the planer are several good angle irons, plenty of straps and bolts and a sufficient supply of cutting tools. The shaper is a handy machine to utilize on this work as it can be run at high speeds while on comparatively short strokes. Care must be exercised in using the shaper, however, when true work is wanted, for two reasons. First, in raising and lowering the platen, chips are liable to work in behind the upright and crossrail which destroys the parallel alignment between the travel of the ram and the surface of the platen. It is obvious that when this condition exists, tapered work will result. Second, the ways of the ram wear in time, due to taking heavy cuts, making it impossible for the machine to plane a true surface.

On the other hand, the planer generally stays in good alignment for many years, provided it is set on a firm foundation in the first place. An occasional facing off of the platen is all that is required to keep the tool in first class condition for many years. A planer that is used every day on tool work should have its platen faced off about once a year. In time, the cross rail may become worn to the extent of causing the machine to plane work that is not flat when inspected crosswise. A planer will have to be used for many years, however, before this condition exists.

The milling machine is also a handy tool to use in machining jig castings. Equipped with several large cutters, of the end cutting variety, jigs can be machined in an economical manner. In using the miller for this work, however, one factor is present that is often considered detrimental, that is, it is a more time-consuming operation to scrape a piece of work that comes from the miller than it is to scrape a surface that has been finished by planing. As the majority of bases for accurate jigs must be scraped to insure their being true, many toolmakers prefer to machine these pieces on the planer because this machine leaves a surface that is easily scraped.

Several machines can be used to advantage for jig boring. Small jigs are often bored by strapping them to the face plate of the lathe, indicating buttons that have been previously located for this purpose and then drilling and boring the holes. For extremely accurate small work, master plates are often used in connection with the lathe.

Advantages of the Miller

The milling machine can be used to advantage in jig boring, provided it stands square, as previously explained. This machine, however, possesses one disadvantage in that the knee being comparatively short, it is sometimes impossible to get it far enough away from the column to insert boring bars. For boring comparatively short holes, however, the milling machine is used in many large toolrooms with excellent results.

Without a doubt, the ideal machine to utilize for jig boring is the horizontal type boring machine. As this machine is not an all-around tool,

special attention in its design has been given to one object only, and that is to produce a machine for boring.

The lathe, planer, milling machine and grinder are the principal machines used in the toolroom and to make them produce to maximum efficiency it is evident that one man operating one machine or several machines of one type (not necessarily at the same time) is surer of producing more efficient results than if he attempted to use several different types of machines in the course of a week in making one jig.

A man who possesses the necessary skill and "accurate touch" to bore precision jigs within close limits receives comparatively high wages. Thus if he spends his time on operations where a high degree of skill is not required, such as turning jig bushings, his employer is the loser because a lathe hand, generally called a toolroom lathe hand in this case, receives often 25 per cent less wages than a firstclass toolmaker. Finishing jig bushings by grinding is, of course, accurate work. However, the desired accuracy is easily attained by a boy or a woman in a few weeks' time. For this reason operators to run grinding machines in the toolroom can be hired much cheaper than first class toolmakers. For this reason it is again seen that the proper division of labor and routing of work is of importance in keeping down production costs.

Although toolmakers usually understand how to harden and temper practically every tool that is used in the average manufacturing plant, they should not be allowed to harden and temper work in every day practice. A tool hardener, who does one thing day after day, is certain to know more about the heat treatment of steel than does the toolmaker.

Where Women Are Efficient

In making small tools such as reamers, cutters, etc., a necessary part of the routine of every toolroom, the world war has taught that women are highly efficient. As the work to be handled is comparatively small, no physical exertion is entailed. As a matter of fact, women can chuck out, bore, turn, cut and grind milling cutters and like tools, day after day, without any apparent overexertion. It is well known that a woman's hands are more nimble than are those of a man. For this reason, they handle this comparatively small class of work in a more rapid manner.

Probably of the various classes of efficient workmen, diemakers are the hardest to find. This work calls for exceptional skill, good judgment and long practice at handling hand tools such as files, scrapers, etc. To make dies efficiently, whether they are little ones for punching out watch hands or big ones for blanking our armature disks, calls for the selection of the proper kind of labor. Not all toolmakers are diemakers although a diemaker often speaks of himself as a toolmaker.

In late years the introduction of die-filing machines has aided materially in cutting down diemaking costs. While it requires skill to operate one of these machines, it does not require the same degree of skill that is necessary to file dies by hand. For this reason the installation of die-filing machines is gradually finding favor even among manufacturers who have only comparatively few dies to make in the course of a year.

To introduce a high degree of efficiency in the toolroom is really a simple procedure. The machine tool equipment should be as complete and up-to-date as possible; the work should be routed so that each man does that for which he is best adapted, and the department should be under the supervision of a man who, through skill and long training, knows toolmaking from start to finish. Once let the working force find out that its foreman is not competent to prosecute the work he hands to the men and the morale of the whole force is bound to be lowered.

Gives Practical Advice on Labor Plans

BY E. B. TOLSTED

THE annals of the country are full of examples of misused power both on the part of employers individually and collectively and on the part of organized workmen. In the interest of the nation as a whole the disastrous effects of misused power must be eliminated. It must no longer be possible for employers by virtue of their financial resources and solidarity to treat workers unfairly, or for the workers through the open strike or the passive "strike on the job" to cripple industry.

To careful thinkers the solution lies definitely along the lines of a clear understanding by each side of its own attitude and of the problems of the other, and of their joint recognition of their relation to society. The result is bound to be in many instances the substitution of responsibility for irresponsibility, of co-operation for antagonism, of good will for ill will. This greatly desired result, the securing of industrial peace and efficiency, is so gigantic a problem that even the best thinkers in the economic field have as yet reached no definite practical solution. We are as yet in a state of flux.

Many Favor Employes' Representation

Many workers appear not to be satisfied by good working conditions, shortened hours, and high wages; they strike even after these things have been granted them. No doubt some want a voice in the determination of these matters, although the dissatisfaction is largely due to the spirit of the times. It may be that the real desire is for first hand information about the conditions which cause managers to come to their decisions. Probably no body of American men, for instance, would deliberately demand wages which they knew would bankrupt the business which employs them.

Of the various plans for producing industrial satisfaction which have been advanced up to the present time, the one which is attracting the greatest attention is employes' representation. Some feel that this is just another short-lived fad; others think that it is here to stay. A safety engineer cannot help recalling the time when the safety movement was a fad.

Many employers, not hostile to union organization, feel that better results will be obtained through an employes' representation plan than through the customary union channels, because of the direct relation and the mutuality of interest which can be obtained. In effect, the usual employes' representation plan creates a company or household union, sometimes alongside a national union. There need be no conflict between the two.

There are at the present time about

From a paper presented at the eighth annual congress of the National Safety council, Cleveland, Oct. 2. The author, E. B. Tolsted, is associated with the Independence Bureau, Philadelphia.

150 employes' representation plans in operation in the United States. By personal investigation of approximately 50 of these plans, we have found that employes' representatives may provide simply an orderly method for the adjustment of grievances; it may include machinery for collective bargaining with reference to wages, hours, and working conditions; it may be the means of eliciting from workers their hearty co-operation and valuable suggestions regarding processes, organization and policies; or it may involve all of these or any combination of them. Its structural features may be very simple and the procedure altogether informal, or these may be highly elaborate. The power possessed by employes through their industrial representation may be that of "public opinion," the authority of the representatives being merely advisory to the management, or the management may delegate to the employes final authority in regard to certain specified matters, or authority may be exercised jointly by the men and the management.

Take More Interest in Work

One very definite advantage of works committees which seems to be reported without exception is that representatives take back to the employes from the meetings a more adequate appreciation of the problems of the management, and that this, together with the increased comprehension by the executives of the problems, desires and ambitions of their workers, results in a much better understanding on both sides.

One company reports that during the first few months after the establishment of its works committee system, production was increased about 20 per cent and expenses advanced less than 5 per cent, while another reports an increase of 15 per cent in production without an advance in wages. Both attribute the increased efficiency largely to the better plant spirit brought about by the works committees.

Several concerns report that while at the first election a number of "radicals" were elected, the employes soon learned to distinguish between mere talkers and competent representatives.

Without exception, where a works committee has been in operation for several months, the company reports that it has revealed capacity for leadership among employes which otherwise would have been suppressed or have found an outlet in some undesirable channel.

Industrial representation is in successful operation in plants varying widely as to process and products, size and complexity of organization, and as to the character of the working force. None of these factors seems to determine the success, although each of them affects it and must be taken into consideration in working out the application of any plan to particular needs. But here are a few suggestions which I think it would be well for everyone to consider when contemplating a plan:

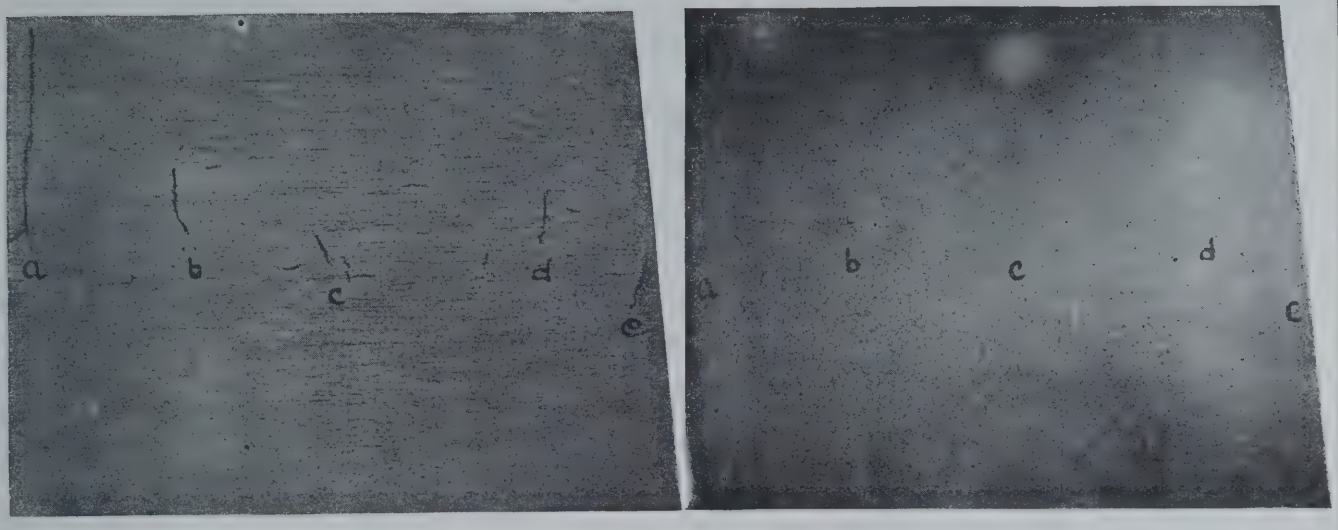
Install it under peaceful conditions. One large company inaugurated a plan as the result of a strike, and the plan ended in another strike some time later. The company is now attempting to make a new start. To propose a plan to men on the verge of a strike is also almost certain to result in failure to win over the men.

To attain its highest success, a plan should be developed gradually, each step in so far as possible resulting from suggestions or requests of employes. By all means, do not impose a ready-made plan; let the men help work it out; it will be a better plan and they will feel that it is their own.

See that the plan is simple in form so that procedure under it is easy to understand and to carry out. As to the specific form, we find that the best results have been obtained with the joint committee. But give opportunity for free discussion, that is, discussion without the presence of the management. It has been found good practice to alternate joint and separate meetings, with final action taken only in joint meetings. At a banquet held recently by the Standard Oil Co. of New Jersey for the representatives of the men and the management, one of the employes' representatives suggested the establishment of separate boards for the management and the men. This action was not especially desired by the representatives, who had already taken up the subject once and voted against separate boards, but the men felt that their delegates would not speak freely before their "bosses."

In some plans the committees deal only with working conditions and welfare work, such as light, ventilation, locker rooms, etc.; in some they deal with all matters which directly concern the worker, including wages and hours. There are drawbacks to both plans. On the one hand, committees which have been restricted in their activities have grown restless and felt that they were deprived of their just rights. On the other hand, committees which have been given free sway have sometimes failed to use judgment in the determination of hours and wages. In one plant, it is said that wages were forced up, despite the company's claim that they could not meet an increase. The reply of the men was, "Raise the price of your product." Experience would seem to show that a middle course works best.

Give your committee supervision over working conditions and welfare work; educate them through the use of this function to a better understanding of the position and problems of the management; then as they show themselves capable of handling the more serious problems, extend their authority toward grievances, hours, wages, absence, cost of living, community conditions, etc. In most cases, it will be found that the desire for a wider scope of activities will go hand in hand with the growth of ability to handle the higher subjects.



We advise that every employe, man or woman, citizen or alien, be made to feel as far as possible that he has a part in the operation of the plan.

It is especially important to make it plain that the plan in no way interferes with membership in unions or with existing relations of the management with labor unions.

Usually best results follow holding meetings during working hours. In one case, which has come to our attention, the representatives requested that the conferences be held out of hours, as they would feel less constraint in voting as they pleased. As a rule, however, committees which meet outside hours have failed to hold the interest of the representatives.

Germans Fear Scarcity of Iron Ore

The future of the German iron and steel industry is a question of more than national interest. Professor Krusch has been at pains to ascertain the available ore reserves of Germany in the altered territorial circumstances now existing, and to calculate their duration on the basis of the prewar consumption. The results show a dependence on foreign sources of supply that is not encouraging for the future prosperity of Germany's chief industry. When the loss of rich ore-bearing lands consequent on the failure of war aims is taken account of, the life of that industry appears short. In less than 40 years the home reserves will have been exhausted. With France, the richest country in Europe in iron ore, rapidly developing her resources, the outlook for Germany is not encouraging. —*Zeitschrift fur angewandte Chemie.*

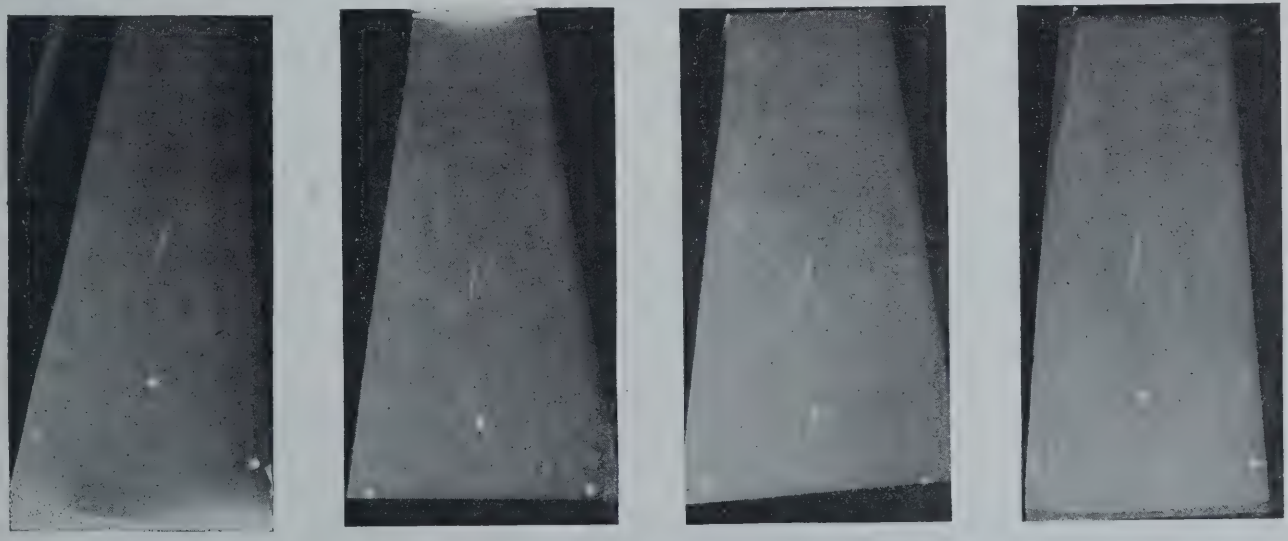
FIG. 1—LONGITUDINAL SECTION OF TRANSVERSELY FISSURED RAIL HEAD SHOWING INTERIOR FRACTURES

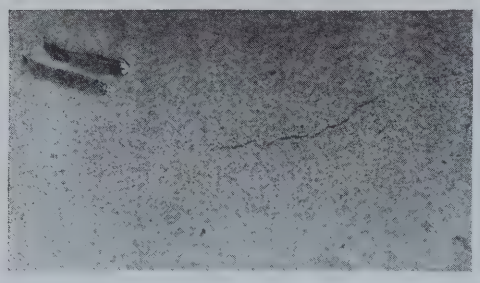


A—Interior fractures revealed by deep etching with hot concentrated hydrochloric acid
B—Same specimen as *A* before etching. The defects have been located by magnetizing the specimen and then immersing it in kerosene containing fine iron dust in suspension. X-rays failed entirely to reveal the presence of these defects.

Using X-Rays in Examination of Steel

BY HENRY S. RAWDON

IN EXAMINING steel by means of X-rays the United States bureau of standards has been limited to apparatus of the 100,000 volt (10-inch spark gap) type mentioned by Dr. Ruder, hence it has not been possible to attempt readily, with any hope of success, the study of specimens whose thickness exceed 1 inch. Most of the examinations have been made upon specimens considerably less than this thickness. Of course with lighter metals and alloys, such as aluminum and its light alloys, much thicker specimens may be used and very satisfactory results obtained. In the study of this class of metals the method appears to offer more possibilities than in the field of iron and steel. It is believed that some of the applications of metal-radiography made at the bureau of standards laboratories and working within the limits outlined by Dr. Ruder,



From a discussion of the paper presented at the sixteenth general meeting of the American Iron and Steel institute, New York, Oct. 24, by W. E. Ruder. The author, Henry S. Rawdon, is physicist, United States bureau of standards, Washington, D. C.

FIG. 3—NATURE OF THE DEFECTS IN TRANSVERSELY FISSURED RAIL HEADS

A—Defect similar to those shown in Fig. A. Located in the magnetized specimen by fine iron dust in suspension in oil. *B*—Same specimen after locating the defect by a punch mark at each end and then wiping off the iron dust. *C*—Same specimen, retreated with iron dust. *D*—Similar defect which has been opened up by means of two punch marks. *E*—Similar specimen. The material was broken transversely to reveal the interior fracture. It was impossible to locate these defects by means of radiographic examination.

are suggestive and interesting enough to warrant a short description.

In the study of flaky steel, unfortunately, it was desired to follow the behavior of material known to be defective through a series of heat treatments without mutilating the material in any way. The claim has been made repeatedly that proper heat treatment alone is sufficient to remedy the defect known as flakes. Fig. 2 shows a series of radiographs of a specimen of gun steel, containing 0.38 carbon, 2.92 nickel and 0.20 per cent chromium. The specimen, which was a transverse radial section of a finished gun-tube forging, was ⅜-inch in thickness. The three white circular spots were produced by drilling holes of the size shown nearly half way through the specimen; these were needed as reference points for locating the various features revealed by the examinations. The four radiographs represent the material in the following conditions: *A*, the finished forged gun tube, as received; *B*, after annealing for 30 minutes at 900 degrees Cent., and cooling in the furnace; *C*, after heating in a barium chloride bath for 30 minutes at 900 degrees Cent., and quenching in oil; *D*, after heating for 30 minutes at 1050 degrees Cent. and quenching in oil. The series of radiographs show the gradual opening up of the defects. In many of the flakes in the initial or forged specimen the metal on the two sides of the separation was in such intimate contact that the intensity of the transmitted rays at the point was practically the same as that of those which passed through the adjacent sound metal, hence no evidence of the flakes was recorded on the photographic plate. The behavior of the defects during vigorous heat treatment is shown by the increase in number and in definiteness of the white lines in the radiographs, which change can be due only to an increase in the width of the separation or fissures. The same method is to be used in the further study of this material to show the behavior of flakes in defective material when it is mechanically worked.

Examining Fissured Rails

A similar application was attempted in the study of transversely fissured rails. The deep etching by means of concentrated acid of sections cut from the head of rails which have developed transverse fissures in service shows the presence of very serious defects such as are illustrated in Fig. 1. The presence of these defects in the material before etching had never been demonstrated and as a result a grave difference of opinion as to their seriousness and the real character existed. Longitudinal slices, ¼ inch in thickness cut from the head of a rail were examined by means of X-rays in an endeavor to locate such defects before the specimen was etched. Although the piece was known to contain these defects and their location had been definitely established by means of a magnetic method, no trace of their presence could be obtained by the X-rays. This confirms the third conclusion of Dr. Ruder that the detection of defects which if exposed to view, are invisible to the eye is very uncertain, if indeed, any indication is obtained. The method by which the defects were located in specimens, previous to etching, was to polish the surface as for microscopic examination, magnetize the piece, and then bathe it in a light oil such as kerosene, containing fine iron dust in suspension. Wherever a discontinuity in the metal exists a change in the density of the magnetic flux results and the particles of iron arrange themselves so as to outline the shape of this discontinuity. Of course this method can be applied only to the detection of defects which extend to the surface. Fig. 3 shows the appearance of interior fractures located by this means. Although an actual discontinuity exists as was shown by cutting out sections and breaking them in two, and is of such an extent that it must be regarded as a very serious defect, the metal is still in

such intimate contact along the plane of the separation and the face of the separation is so irregular in its contour that the transmission of the X-rays here is the same as that through the adjacent sound metal.

Another application was made of X-rays in the study of specimens which were to be tested as to their behavior under fatigue tests. The interior condition of three typical specimens which were of the shape and size for the Upton-Lewis machine is shown in the radiographs *A, B, C* of Fig. 4. In this case as before, the specimen was so placed that the path of the rays was parallel to the plane of the flake. The type of fracture produced in the fatigue test for each class of steel is shown in *D, E, F,* Fig. 4. As might be expected the material showing no evidence of the flakes broke with a smooth porcelain-like fracture, the others show large conspicuous crystalline areas in the face of the fracture corresponding to the flakes. The examination of test specimens, particularly those tests which are expensive either from the viewpoint of the time required to carry one to completion or of the extreme care which is required in shaping the test specimen, is probably one of the most important applications which can be made of metal-radiography. In the investigation of arc-welded materials now in progress at the bureau of standards laboratories it is proposed to examine all specimens for the impact and the fatigue tests in this manner in order to locate any serious defects such are quite common in welded materials which would vitiate the results of the test.

Other applications of the method have been made mainly of a miscellaneous character, however. One such examination was of complex mixtures such as copper-lead bearing metals in which the fineness of the grain of the mixture which can be detected by X-rays is very surprising. Another instance worthy of mention is the examination of a small ingot too thick for the X-ray apparatus available by means of the radiations from radium. The presence of an enclosed pipe was indicated by the radium-radiograph obtained. It is believed however that the most interesting and helpful work has been along the two lines described.

The division of metallurgy of the bureau is indebted to the co-operation and help of Dr. Dorsey by whom the radiographic examinations were made.

About 90 per cent of the potash in blast-furnace gas can be collected in a product containing from 5 to 30 per cent total potash, of which 80 per cent is readily water soluble. In

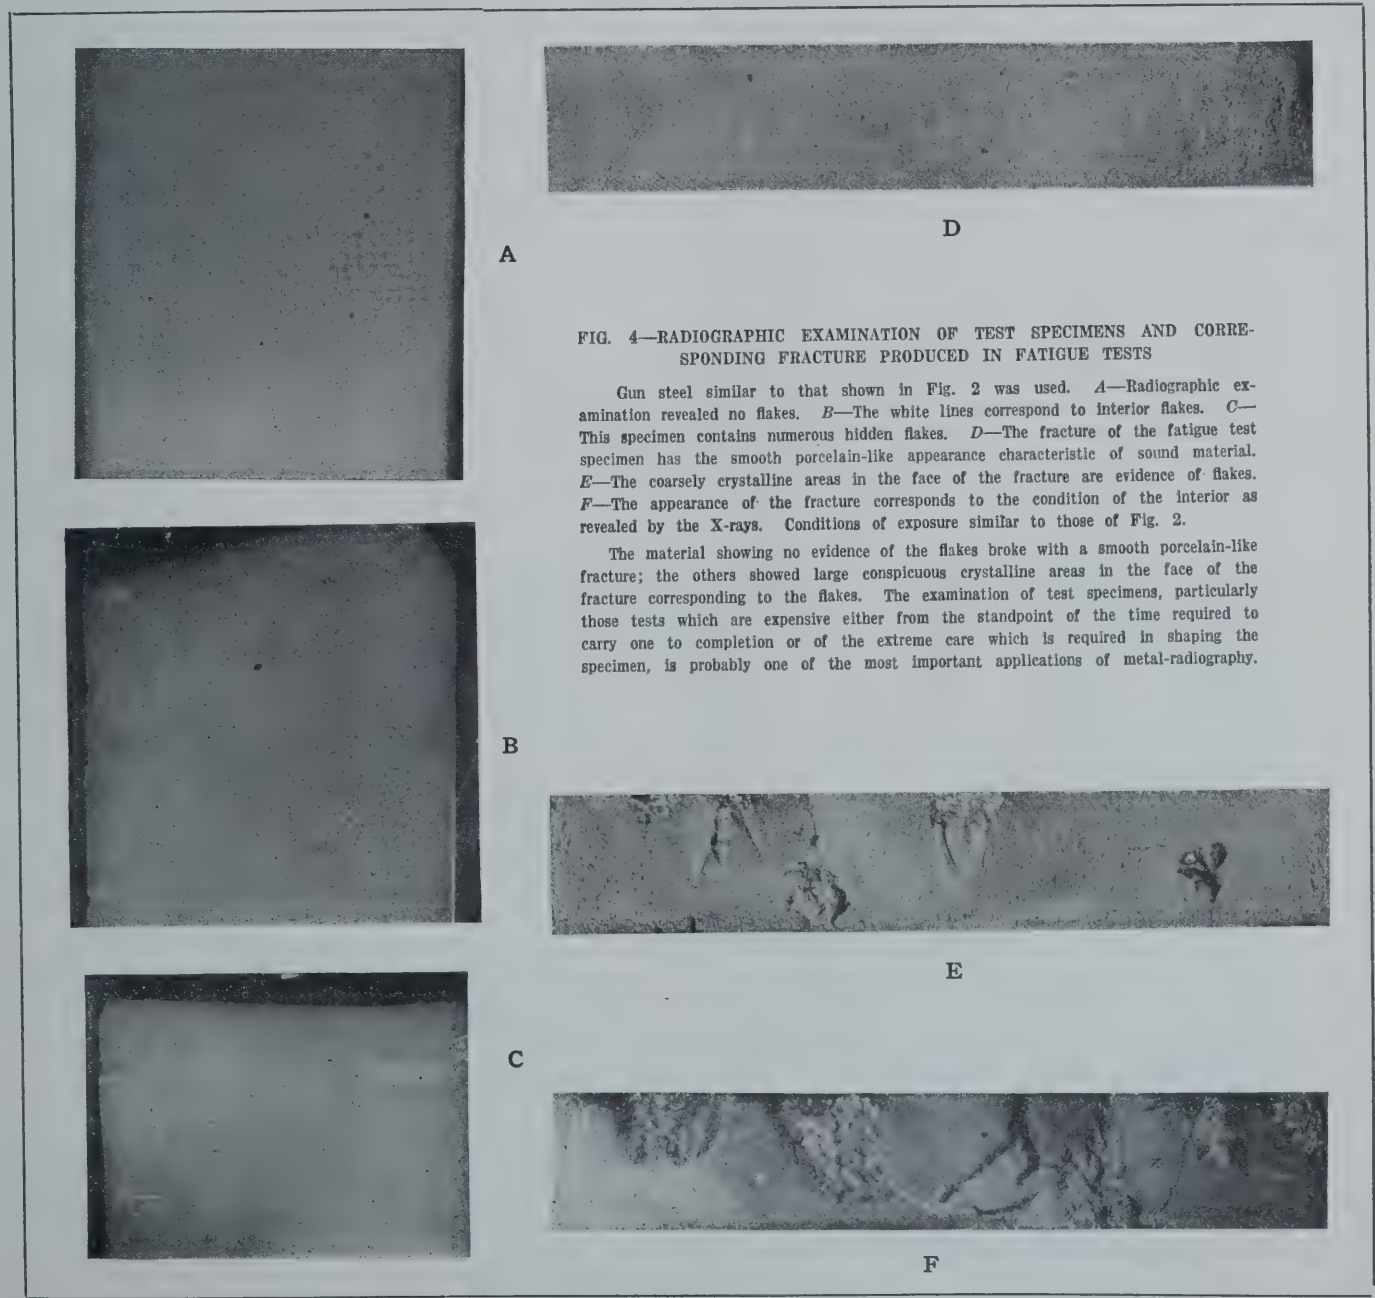

FIG. 4—RADIOGRAPHIC EXAMINATION OF TEST SPECIMENS AND CORRESPONDING FRACTURE PRODUCED IN FATIGUE TESTS

Gun steel similar to that shown in Fig. 2 was used. *A*—Radiographic examination revealed no flakes. *B*—The white lines correspond to interior flakes. *C*—This specimen contains numerous hidden flakes. *D*—The fracture of the fatigue test specimen has the smooth porcelain-like appearance characteristic of sound material. *E*—The coarsely crystalline areas in the face of the fracture are evidence of flakes. *F*—The appearance of the fracture corresponds to the condition of the interior as revealed by the X-rays. Conditions of exposure similar to those of Fig. 2.

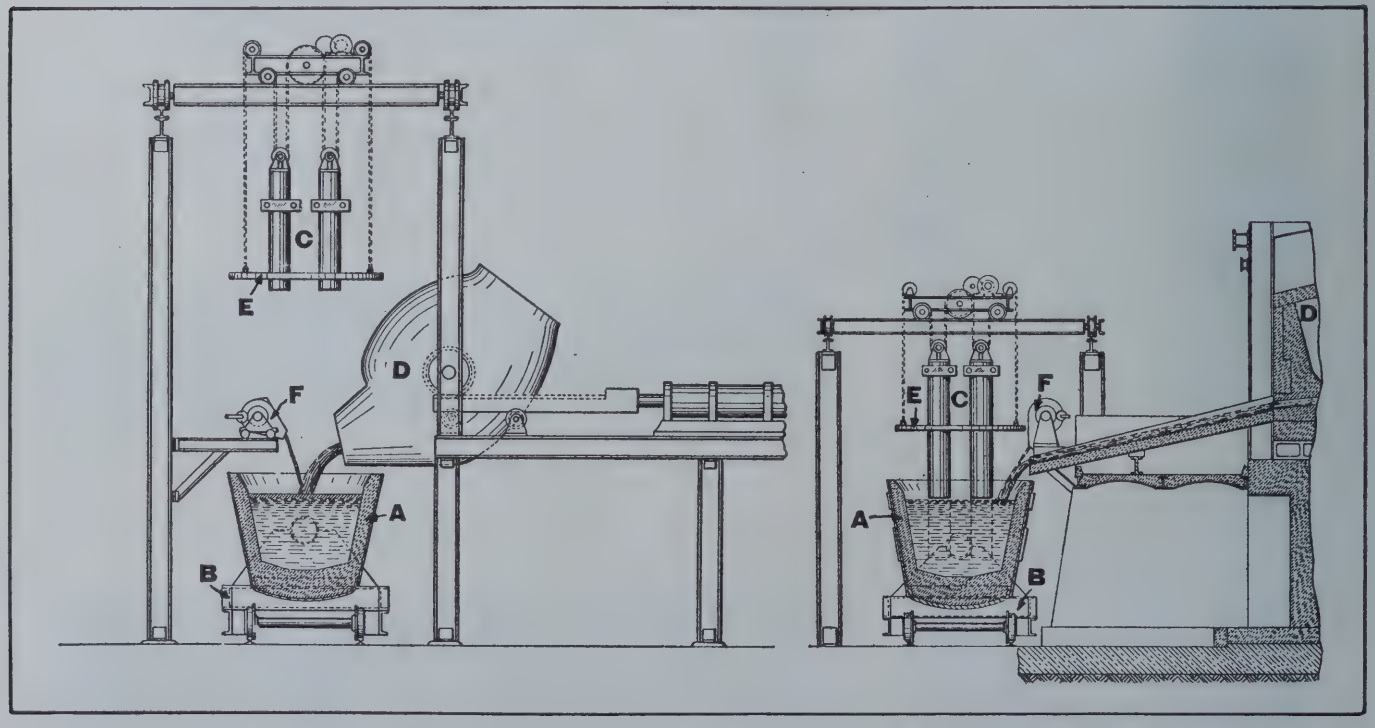
The material showing no evidence of the flakes broke with a smooth porcelain-like fracture; the others showed large conspicuous crystalline areas in the face of the fracture corresponding to the flakes. The examination of test specimens, particularly those tests which are expensive either from the standpoint of the time required to carry one to completion or of the extreme care which is required in shaping the specimen, is probably one of the most important applications of metal-radiography.

other words, if the average burden contains 12 pounds of potash per ton of pig, about 6 pounds of potash per ton or about 50 per cent can be recovered as readily, water-soluble product. With a higher potash content of charge, a higher percentage of extraction is possible.

Investigations as to the possible potash recoveries are now being made at a plant located in the Birmingham district, where the potash content of the blast-furnace charge is higher than at the northern plants.

Under the present methods of handling blast-furnace gases, either using them directly in the stoves and boilers, or passing them first through washers and scrubbers before utilizing them in stoves, boilers, or gas engines, very little volatilized potash is recovered, most of it being lost in the water with which the gases are washed in the primary or secondary washers. A large proportion is actually discharged into the atmosphere.

Possibly about 1000 to 1500 tons of potash per year might be caught in the dust in the boilers and stoves at blast furnaces where the charges contain relatively high potash content, but even during the high price conditions existing during the war, the maximum recovery from this source was actually less than 500 tons per year.



Super-Refining Steels Electrically

IMPROVEMENT in the manufacture of steel by subjecting the product of either the bessemer converter or open-hearth furnace to electric treatment is claimed in a recent patent by John McConnell, superintendent of the open-hearth department, Interstate Steel & Iron Co., Chicago. It is said that by the use of Mr. McConnell's process a large tonnage at a minimum cost and a more uniform product is obtained and that only a small amount of oxidizing materials is required, due to the fact that little material is lost during the oxidizing period.

As shown in the accompanying illustrations, standard equipment is used. While the steel is being tapped into a ladle, the desired alloys in a cold state may be added to the streams of metal from a container, *F*, as shown in the drawing. It is preferable to introduce the alloys in the form of ferroalloys and crushed. Particularly in the case of chromium, it has been found that when the addition is introduced into the furnace, usually at the time or just before tapping, there is a large variation in the product. This is due to the alloy being subjected to furnace reactions which cause it to be oxidized and to go into the slag.

When the open-hearth furnace is tapped, all of the metal and slag, as is the usual custom, is directed into the service ladle. A small amount of slag is allowed to remain in the ladle for the purpose of keeping the steel hot, the remaining part being directed into a cinder thimble or slag pocket. The electrodes are lowered into the bath, as shown below, and the current applied for approximately 15 minutes. This sets up a mixing action; removes the minute cavities of slag that have arisen from internal chemical actions, and also some oxygen, the oxides going into the slag; and, effects further purification from

In the basic process of steelmaking a substantial amount of the phosphorus can be removed. Sulphur, however, is more difficult and uncertain to control. If it is desired, when using Mr. McConnell's process, to remove sulphur from steel in the ladle by other means than temperature, which always is a potent factor in sulphur elimination, the slag is removed from the top of the metal. Lime or a similar product in combination with fluorspar is added to make a basic slag. The latter removes part of the sulphur and absorbs the impurities and oxides from the steel. Further purification can then be effected by lowering the electrodes into the bath of steel and applying the current. It is claimed that the process is particularly adapted to refining open-hearth, bessemer and alloy steels by the duplex method.

IN THE ILLUSTRATION AT THE RIGHT THE DOTTED LINES OF THE ELECTRODES SHOW THE POSITION OF THE CARBON ELEMENTS AS THE MOLTEN STEEL AND THE OXIDIZING PRODUCT ENTERS THE LADLE. THE ILLUSTRATION AT THE LEFT SHOWS THE POURING POSITION OF A BESSEMER CONVERTER AND AN ALLOY CONTAINER WITH ELECTRODES AND LADLE COVER SUSPENDED FROM ABOVE

Announce Program

For National Founders Convention at New York Nov. 19 and 20

Announcement has been made of the program for the twenty-third annual convention of the National Founders association to be held at Hotel Astor, New York, Nov. 19 and 20. A large attendance is expected. The opening session will be devoted to the usual reports of officers and committees. At this session, George F. Monaghan, general counsel for the association, will deliver an address on "Industrial Unrest."

Papers to be read at the Wednesday afternoon session include, "Government Competition in Industry," by W. H. Van Dervoort, president of the Root & Van Dervoort Engineering Co., Moline, Ill.; "The Washington Industrial Conference," by James A. Emery, counsel for the National Council for Industrial Defense; "British and American Labor Problems," by Prof. J. Laurence Laughlin, of the National Industrial Conference board, and "The Man with a Number," by Richard H. Waldo, manager of the Inter-Racial Council. At Thursday's session, H. P. Bole, vice president of the Hydraulic Pressed Steel Co., Cleveland, will read a paper, "The Industrial Association of Cleveland," and L. R. Clausen, of, Deere & Co., Moline, Ill., will deliver an address.

At the annual banquet to be held Wednesday night, William H. Barr, president of the association, will act as toastmaster. Among speakers will be the Rt. Rev. Charles H. Brent, senior chaplain of the American Expeditionary Forces in France.

Hoist Data Considered

Data relative to tracks and switches, as compiled by the engineering committee, was discussed at the regular monthly meeting of the Electric Hoist Manufacturers' association at 9 West Fortieth street, New York City, Oct 28. Consideration also was given to the committee's report on its work relative to cables, hooks, load blocks, and certain other appurtenances. Bulletins comprising this data will be issued at an early date. The next meeting of the association will be held at the Fortieth street address, Dec. 5, at which time the standardization of certain auxiliary equipment will be discussed.

The membership of the association now comprises the Alfred Box Co., Inc., Philadelphia; the Brown Hoisting Machinery Co., Cleveland; the Detroit Hoist & Machine Co., Detroit; the Euclid Crane & Hoist Co., Euclid, O.; the Franklin-Moore Co., Winsted, Conn.; the Link Belt Co., Philadelphia; the Northern Engineering Works, Detroit; the Roeper Crane & Hoist Works, Reading, Pa.; Shepard Electric Crane & Hoist Co., Montour Falls, N. Y.; Sprague Electric Works, New York City; and the Yale & Towne Mfg. Co., New York City.

Grinding Reduces Losses Incurred From Surface Defects

TO REMOVE surface defects from the billets from which tool steel is produced, the Ludlum Steel Co., Watervliet, N. Y., resorts almost entirely to the grinding method described on page 1690 of THE IRON TRADE REVIEW of June 26. It is estimated by the company that prior to the installation of the grinding machines, the average losses incurred from surface defects in alloy steels, and, particularly, high-speed steel, amounted to slightly more than 61 per cent of the heat. That is, for every ton of high-speed steel melted, only 750 to 800 pounds were shipped. Since the company installed grinding machines, the loss due to surface defects has been so reduced that it now is possible to ship 75 per cent of each ton melted. In addition, the resulting product has a better surface than was possible before the grinding method was adopted. The company now has 60 billet grinding machines working continuously, and both alloy and carbon steels are ground after each operation so as to remove all surface defects as they appear. A battery of these grinders is shown below.

Strike Chiefs Held Most to Blame

Senate Committee Declares Responsibility for Walkout in Steel Industry Rests With Gompers, Fitzpatrick, Tighe and Foster—"Wages Satisfactory, Hours Too Long"—Industrial Commission and Americanization Urged

WASHINGTON, Nov. 11.—Recommendations for legislative action made by the senate subcommittee on education and labor in its report on its investigation of the steel strike call for the establishment of a commission similar to the war labor board, enactment of the Americanization bill reported favorably about two weeks ago; better naturalization laws and passage of a law dealing with those who would destroy the American government. A bill for the last named purpose already has been prepared by Senator Sterling and is before the judiciary committee. In addition to these recommendations, the commitee suggested the adoption of the straight 8-hour day in the steel industry.

The subcommittee which made the report consists of Senator William S. Kenyon, chairman; Senator Thomas Sterling, Senator Lawrence C. Phipps, Senator Kenneth McKellar and Senator David I. Walsh. While the senate resolution providing for the investigation did not request the committee to suggest remedies, the committee decided to do so.

While the committee acknowledges that it had differences of opinions on some of the broader issues involved it was in substantial agreement, making possible a unanimous report. It was thought for a while that Senator Walsh, a strong supporter of organized labor, might file a minority report.

The report severely criticizes William Z. Foster, secretary of the steel strikers' committee, for his radical views, the committee expressing the belief that they have not changed much from time when he advocated syndicalism. Foster was urged to withdraw from leadership in the strike.

The report also contains strong attacks on all red agitators, many of whom have been extremely active in connection with the strike; mild rebukes for Samuel Gompers, president of the American Federation of Labor, for supporting the strike; a suggestion that Judge E. H. Gary, chairman of the United States Steel Corp., would have done well to have received members of the strikers' committee, except men with such views as those held by Foster, and criticism of both sides for not being willing to heed the request of President Wilson to postpone the strike. The question of wages paid in the steel industry, it was stated in the report, was not involved in the controversy and few of the witnesses examined at the hearings made any complaint as to wages. Working and living conditions of employes are approved and praise is given to employers for taking such good care of their workmen in these respects.

Referring to Judge Gary, the committee says that in refusing to receive a committee claiming to represent the men in the employment of the corporation, "he could well have objected to receiving a man with the views of Mr. Foster," but explains he did not put his refusal on that ground, "but put it rather on the ground that the men did not represent the employes, though himself conceding that 10 to 15 per cent of the mills were probably unionized."

The committee explained that it seems that "even 10 to 15 per cent of the men had the right to select their own representatives and present their grievances to the steel company (meaning the Steel corporation) and that they should have been heard. Judge Gary could have announced to them, as well as he did afterwards in his letters to the presidents of his subsidiary companies, that he would not deal with representatives of the unions, and that he considered the question one of open and closed shop; likewise, it seems to us unfortunate that Mr. Gary did not answer the letter of Samuel Gompers, the accredited representative of the American Federation of Labor. Such things do not tend to harmonize conditions but rather to accentuate them."

Criticism is made of Mr. Gompers at several points in the report, once with regard to responsibility for the strike. The committee states bluntly that the letter of the steel strike committee, Chairman John Fitzpatrick and others, to President Wilson under date of Sept. 19, saying the strike could not be prevented, contains at least one statement that is false, wherein it declares "seven of the organizers and members had been brutally murdered in cold blood."

While the committee says responsibility for the strike rests primarily with Fitzpatrick, M. F. Tighe and Foster, it is pointed out that sole responsibility can not be entirely charged to them, but holds Gompers responsible also for having decided at the meeting of the 24 responsible leaders of the unions involved on Sept. 19 that further delay would result in failure to hold the men from striking.

"Wages Satisfactory"

THE question of wages is not involved in the controversy," says the senate committee in its report on the steel strike. "Few of the witnesses examined made any complaint as to wages. Some of them did contend that they should have 12-hour pay for 8-hour work, but most of them, while striking for an 8-hour day, claimed only a fair living wage. It is the opinion of the committee that, broadly speaking, the employes of the steel industry at the time of the strike were fairly well satisfied with the wages received, and that such question was not persuasive at all in any consideration of a strike.

"It may also be said that most of the men speak highly of such homes as are furnished by the company. There is undoubtedly great need of more homes to be sold to the men in order to encourage home owning. They rent these homes at very reasonable prices, and the general condition of these homes seems fairly good.

"We find also little complaint as to lack of safety appliances, as to improved machinery, or as to conditions in general outside of the long hours of work. In encouraging and assisting its employes to become owners of its stock; in guarding its employes against accidental injuries; in caring for the sick; and in sanitary precautions generally the work of the United States Steel Corp. at the present time is in the main admirable, and in refreshing contrast to the shortsighted selfishness that still persists in many manufacturing concerns."

Taking up the causes of the strike, the report says that the underlying cause is the determination of the American Federation of Labor to organize the steel workers in opposition to the known and long-established policy of the steel industry against unionization. In this connection attention is called to the claim of the steel employers that the object of the organizers in unionizing the shops was to bring about a closed shop and that a closed shop means lessening of production. With Judge Gary, the committee says, this seems to be the most important proposition.

This cause, the report points out, was seized upon by some radicals in the American Federation of Labor to elevate their power in that organization. It is stated that were it not for the attempt to unionize the mills the strike in all probability would not have occurred. Various reasons for the strike as given by both sides are set forth and it is declared that Judge Gary lays down as the fundamental issue the question of the open or closed shop, while Fitzpatrick and Gompers contended that the open or closed shop is not in issue.

Regarding its finding of the right of men to select their own representatives to present their grievances, the committee makes an exception of men holding such views as those of Foster. The committee agreed the principle of collective bargaining is a right of men working in industry and declares that collective bargaining has generally been recognized as a right of labor and is apparently one of the effective methods that labor has to secure its rights.

"The right of collective bargaining, however, should not be employed for the purpose of discriminating against any class of workmen whether union or nonunion men," the report states.

The committee proceeds to say that there may be two kinds of closed

Recommendations Made by Senate Committee

FIRST. That a board or commission somewhat similar to the war labor board should be established. This board to have power of compulsory investigation; to have large power in mediation and conciliation and recommendations; not to the extent of compulsory arbitration, but before this board controversies could be heard, investigations made and decisions rendered. That pending said investigation and decision no strike should be declared provided no employes are discharged for taking part in the controversy and provided further that all opportunity for the employer to take advantage of the delay has been removed; and recommendations made to industry in relation thereto; that the board should be in the nature of a federal industrial commission, seeking at all times not only to settle pending disputes but to help bring about a more harmonious condition between employer and employe.

"A just decision of said board would be indorsed by the public and public sentiment is powerful enough to enforce the findings of such a commission. There is good sense enough among the great body of the American people to bring about an adjustment of these difficulties. The great body of the American people believe in a liberal industrial system, in living wages for men employed in industry; wages that will permit them to raise their families according to the standards of American life and to enjoy recreation from hard, grinding toil; but the American people have no patience and will have none with any leadership that seeks to accomplish its purposes by barbarous methods of freezing or starving the American people. They do not propose to freeze and they do not propose to be starved, and they do not propose that a few men in this country shall have the power to bring about such a condition of affairs. On the other hand, they are as much opposed to an autocracy of capital. Capital must be reasonable likewise. The employer must recognize that there is a new spirit in the world; that labor is not content to be merely a hewer of wood and a drawer of water, and that labor is fighting for a status in industrial life, and it is not concerned with wages.

Why cannot capital and labor co-operate and establish between themselves the doctrine of the square deal; cease to be suspicious of one another, join together and act together for the good of each other and for the well-being of the public at large? It is the hope of the world that military warfare has ceased. Have we not reason also to hope and insist that industrial warfare may cease? It cannot without a spirit of mutual co-operation between capital and labor.

SECOND. *That an Americanization bill be passed by the congress which will provide for the effective education and Americanization of the illiterate foreigners and native illiterates in this country. A bill of this kind has already been reported out of this committee and your committee urges an early adoption of the same by congress.*

THIRD. *It is observable in the strike districts that the men who own their homes are more contented and more interested in the affairs of the country. One real antidote for unrest in this country is home ownership. It is difficult to plant the seeds of revolution in the minds of those who own their own homes. The work of the steel companies in building homes has been most commendable. It is to be hoped that such work will be enlarged and carried on by them. It would not be out of place to suggest that it would be most commendable for the steel companies to use some of their large profits in extending the work of home building. The question of aid and encouragement in the work of assisting townspeople of small means in securing their own homes in some such way as the farmer has been aided under the federal farm loan act is worthy the serious consideration of congress.*

FOURTH. *There should be a change in our naturalization laws which will require the naturalization and some education of all foreigners, at least to the extent of speaking the American language; that they should acquire such knowledge within a period of five years after they arrive, with proper limitations upon further immigration, giving to those already here a certain period of time in which to become naturalized, and if this is not done then deportation should follow.*

FIFTH. *An effective law should be passed dealing with anarchists, revolutionists, and all who would destroy the American government. There are too many Americans who love their country and are willing to give their life for it and who intend that all the doors of American opportunity shall remain open for the children of today and the children of tomorrow to permit a few thousand anarchists, revolutionists, and I. W. W's to keep on with their nefarious propaganda to destroy the government.*

shop, as it understands it, a shop closed against men because they do not belong to a union and a shop closed against union men. Both of such closed shops are declared to be unamerican, but it is stated that the testimony did not disclose either class of closed shop existing in the steel industry. The committee says that no body of men has the right to stop other men from working because they do not belong to a union, nor have employers any right to prevent men joining unions.

"The doctrine of collective bargaining as generally understood is not recognized in the steel mills," it is stated, "and this has caused considerable dissatisfaction upon the part of many of the steel workers. The question of the open and closed shop would not be involved except indirectly until in fact there was a substantial unionization of the plants. However, Judge Gary takes the position that the organization and unionization of the plants of necessity results in the closed shop. The difficult proposition in this matter continually arising is this: Does collective bargaining through union representatives result in a closed shop? If the unions would recognize the right of men to work and be treated as fellow workers even though they do not belong to the unions, it would not of necessity result in a closed shop. The question is one of great difficulty."

Justifies Complaints of Long Hours

The committee says that testimony and study of the situation leads it to the conclusion that while there were legitimate complaints as to long hours of service, that the strike has been seized on by some I. W. W.'s, bolshevists, and anarchists to further their own interests, and that their influence in the strike has been powerful.

The report takes up complaints that the strikers were denied the right of free speech, that officers of the law were brutal, and that the treatment of the strikers in the courts does not accord with the high ideals of American democracy.

"It may be open to question," says the report, "whether permits to hold meetings should have been denied to the workers, and while generally the orders denying permits were obeyed, yet in most instances where clashes occurred or arrests made it was because of attempts to hold meetings after the request for a permit had been denied."

Freedom of speech, it is stated, does not mean unbridled license, but it is added that where a strike is carried on in a peaceful way the least possible amount of restraint and the largest freedom of speech where meetings are conducted in an orderly way "is certainly to be desired in the American republic." Officials, it is stated, should not hesitate to prevent meetings called for the purpose of advocating the overthrow of the government.

The report says there is a third party to the strike, "the great public" and that no one should be permitted to unjustly cause the great body of the public to suffer. Strikes are declared to be a relic of barbarism, "but at present strikes are apparently the only way for labor to secure even its just demands if employers refuse to grant them or submit them to arbitration." It is declared not to be to the credit of the nation that no way has ben devised to settle disputes outside of strikes. Somebody has to pay the bill, it is asserted, and in every instance it is the public.

"The public," says the report, "has a right to demand that capital shall not arrogate to itself the right to determine in its own way these industrial questions, and it is the same as to labor, and the duty is upon the congress as representing the people to provide some means for the adjustment of these difficulties. This was done during the war through the war labor board and their action was fairly satisfactory."

Regarding the 8-hour day, the report states:

"The evidence disclosed that a percentage of the men work eight hours; a larger percentage 10 hours, and a lesser percentage 12 hours, although there is dispute in the evidence as to this proposition.

"Judge Gary testifies that 34.8 per cent work eight hours; 39.40 per cent 10 hours; 26.52 per cent 12 hours. We believe that a large majority of the men actually working in the mills work 10 and 12 hours per day. While there are spells of rest here and there through these long periods of 10 and 12 hours, yet the fact remains that the general rule is either a 10 or 12-hour day, during which the men are on duty.

"There has been some improvement in the steel industry in this respect, for some years ago a large percentage of the labor worked 10 and 12 hours a day and seven days in the week. While the claim is made that the seven-day week has been abolished except in emergencies and the men who work on Sundays are allowed one week day for rest, the evidence on this point is conflicting.

"We believe where continuous operation is absolutely necessary the men should at least be allowed one day's rest in each week. The work in the steel mills is such that men must be constantly in attendance and the work does not stop. To change to an 8-hour day would mean three shifts instead of two. The Steel company claims that it is impossible to get the men. And further, that the men want to work more than eight hours in order to get the additional pay, there being a basic 8-hour day as far as pay is concerned, and time and a half for all time over eight hours.

"It is true some of the workers testified that they wanted to work longer in order to get the increased compensation, but most of them seemed anxious for an 8-hour day with a living wage. The policy of working men 10 and 12 hours per day in the steel mills is, it seems to the committee, an unwise and unamerican policy. There are many hundreds of thousands of employes in the steel mills, a considerable portion who can not read, speak, or write the English language. It is claimed by the Steel company that a very large proportion of those who are out on the strike are foreigners, which is defined in the evidence to be nonenglish-speaking people. The testimony sustains this contention.

"The 8-hour day is involved in the solution of this question. These nonenglish-speaking aliens must be Americanized and must learn our language, so the question of a reasonable working day is involved in the question of Americanization. Men cannot work 10 and 12 hours per day and attend classes at night school. It is the general consensus of opinion of the best economic writers and thinkers that the establishment of 8-hour-day systems does not diminish production. Nor do we think the claim made that an 8-hour day is impossible because the workmen can not be secured for three shifts is tenable. An 8-hour day with a living wage that will enable men to support their families and bring up their children according to the standards of American life ought to be a cardinal part of our industrial policy and the sooner the principle is recognized the better it will be for the entire country.

"The public also has an interest in the problem of an 8-hour day. Fatigue in human kind is a breeder of unrest and dissatisfaction."

"Federation Made Mistake"

Regarding the radicals in the American Federation of Labor, the report states:

"The committee is of the opinion that the American Federation of Labor has made a serious mistake and has lost much favorable public opinion which otherwise they would possess by permitting the leadership of this strike movement to pass into the hands of some who heretofore have entertained most radical and dangerous doctrines. If labor is to retain the confidence of that large element of our population which affiliates neither with labor organizations nor capital, it must keep men who entertain and formulate unamerican doctrines out of its ranks and join with the employers of labor in eliminating this element from the industrial life of our nation. Unquestionably, the United States Steel Corp. has had the support of a larger and of a wider circle in the country during the strike because of the character of some of the strike leadership. Labor organizations should not place the workingmen in the position of any sympathy with unamerican doctrines or make them followers of

any such leadership. Such practice will result in defeating the accomplishment of their demands.

Take the case of Mr. William Z. Foster. Mr. Foster is secretary to the committee composed of the 24 international unions managing this strike. His duties were substantially to act as secretary of the strike, to look after the organization of workers, and to handle the finances. He is in the office at Pittsburgh and seems to be the general manager of the strike. While it is claimed that he has had little to do with it, it is quite apparent to the committee that he has more to do with it than any other man in its actual management. He is one of the signers of the letter to the President and to Mr. Gary. He appears to be a man of excellent education, a thinker, and prolific writer. It is a source of regret to find that a man born in America should have written such doctrines as are set forth in his 'syndicalism' and his more recent publications. At the time of his writing 'Syndicalism' he was wholly antagonistic to American labor unions, and especially to the American Federation of Labor. Soon after, however, he seems to have come to the conclusion that he could accomplish his aims and purposes better by boring from within, as he expressed it in one letter to *Solidarity*, the I. W. W. publication.

Advocated Violence in Strikes

"Carrying out his doctrine of 'boring from within' he became active in organized labor work and soon became a leader. He advocated violence in strikes. He charged the American labor movement was infested with hordes of dishonest officials. He was closely associated with Mr. Margolis, present attorney for the I. W. W.'s at Pittsburgh, who has been behind this strike with all of his power; with Vincent St. John, formerly secretary to the I. W. W.'s, and the evidence convinces the committee there has been little change of heart on the part of Mr. Foster and that he is now in the full heyday of his power in the 'boring from within' process.

"Such men are dangerous to the country and they are dangerous to the cause of union labor. It is unfair to men who may be struggling for their rights to be represented by such leaders. It prevents them from securing proper hearing for their cause. If Mr. Foster has the real interest of the laboring man at heart he should remove himself from any leadership. His leadership injures instead of helps. If he will not remove himself from leadership the American Federation of Labor should purge itself of such leadership in order to sustain the confidence which the country has had in it under the leadership of Mr. Gompers."

Radicals Seek Power By Strike

Conclusions drawn by the committee follow:

"That the laborers in the steel mills had a just complaint relative to the long hours of service on the part of some of them and the right to have that complaint heard by the company.

"That they had the right to have the representatives of their own choosing present grievances to the employers. Some members of the committee believe that more friendly relations would be maintained between employer and employe if the representatives who are chosen to present grievances to the employers were actually working in the industry and that such representatives ought not to be from outside of the industry.

"That behind this strike there is massed a considerable element of I. W. W.'s, anarchists, revolutionists, and Russian soviets, and that some radical men not in harmony with the conservative elements of the American Federation of Labor are attempting to use the strike as a means of elevating themselves to power within the ranks of organized labor."

New Labor Conference's Delay Puzzling

Washington, Nov. 11.—The official promise of a committee of 15 to constitute or plan for another industrial conference to take up the work of the first which failed through labor's play for power has injected another factor into the already perplexing industrial situation. This commitee is said to have been named by the President, but not announced, thereby giving room for more speculation and accentuating uncertainties.

Why the committee has not been announced is, of course, the puzzling point. Several explanations have been offered and it has even been suggested that the committee not only has been selected but notified privately and now may be at work framing a program for public consideration after industrial strife has subsided.

Another reason assigned to the delay in the announcement is that the President wants to wait until he is able physically to take part in the proposed conference. Presidential leadership might harmonize the factions.

More Companies Heard on Basing Point

WASHINGTON, Nov. 11.—More written statements are being received by the federal trade commission in regard to the basing point case, most of the recent ones being opposed to the trade custom. Many of those opposed are members of either the Western Association of Rolled Steel Consumers or of some other organization already committed to the abolition of the practice.

The commission yesterday issued a supplement to the printed booklet issued 10 days ago giving the views as received by the commission. All the statements in the supplement are in opposition to the single basing point. Because of the continued receipt of views, however, the commission will issue no more supplements, but the subsequent statements are on file with the commission and may be seen there. They will be used when the case is considered Dec. 2.

Many Views Are Published

The views published in the supplement are by the joint committee of civic organizations of Duluth, which submitted an amended statement; Howard Stove Co., Ralston, Neb.; Baker Mfg. Co., Evansville, Wis.; Niles & Scott Co., La Porte, Ind.; Gehl Bros. Mfg. Co., West Bend, Wis.; Parsons Co., Newton, Iowa; Golden Foundry & Machine Co., Columbus, Ga.; engineers department of the city of Minneapolis; department of public works, St. Paul; department of public works, Chicago; department of public improvements, Omaha; Brown-Rogers Co., Winston-Salem, N. C.; Towers & Sullivan, Rome, Ga.; the International Shipbuilding Co., Gulfport, Miss.; Austin Mfg. Co., Chicago; Helena Hardware Co., Helena, Mont.; and the Puffer-Hubbard Mfg. Co., Minneapolis.

Subsequent but unpublished views have been received from the following opponents of the basing point: Rockford Bolt Co., Rockford, Ill.; Federal Sign System, Chicago; F. Meyer & Bro. Co., Peoria; Weller Mfg. Co., Chicago; Chicago Steel Car Co., Harvey, Ill.; Salisbury & Satterlee Co., Minneapolis; La Crosse Tractor Co., La Crosse, Wis.; Harris & Reid Mfg. Co., Chicago; Louden Machinery Co., Fairfield, Iowa, and Stewart-Warner Speedometer Corp., Chicago.

In favor of the basing point are the W. J. Holliday Co. and the Indianapolis Bolster Spring Co., both

of which are located in Indianapolis.

So far 22 firms or associations have signified their intention of having representatives here Dec. 2 when the commission begins hearings. Ten others have notified the commission they will be represented indirectly.

Continues Fight to Make Labor Responsible

Washington, Nov. 11.—Repeal of a provision in the deficiency appropriation act exempting labor and farmers' organizations from investigation and prosecution for violation of antitrust law is proposed in a bill introduced last week by Senator Edge, New Jersey. The deficiency appropriation bill was signed by President Wilson Nov. 4.

The specific provision of which repeal is sought by Senator Edge is a proviso exempting labor and farmers' organizations from investigation and prosecution under a special appropriation of $200,000 allowed by the act "for the enforcement of antitrust laws," or combinations in restraint of trade. When the bill was considered in the senate, an amendment to strike out such exemption was defeated by a vote of 28 to 31.

Senator Edge said that judging from hundreds of communications he has received he is convinced that a large majority of the people are in accord with his opposition to class legislation.

Board Named to Study Defense Problems

Washington, Nov. 11.—An interdepartmental board of men intimate with war-time requirements of the military and naval departments has been created by the council of national defense as the first step in its peace-time operation. The board consists of Maj. Gen. George H. Burr, assistant chief of staff, director of purchase, storage and traffic, war department; Rear Admiral William Strothers Smith, on special duty, navy department; Van H. Manning, director, bureau of mines, department of the interior; L. M. Estabrook, chief bureau of crop estimates, department of agriculture; Dr. W. S. Stratton, director, bureau of standards, department of commerce, and Royal Meeker, commissioner of labor statistics, department of labor.

Grosvenor B. Clarkson, director of the council, is of the opinion that the creation of the board is a progressive step toward a scientific and economical consideration of the national defense in all of its various phases. It is expected to check unnecessary duplication of activity on the part of several departments.

"The task of the interdepartmental board is essentially a studious, constructive and planning nature," said Director Clarkson. "The present research staff of the council, which for more than a year has been collecting information and making reports on domestic and foreign reconstruction and readjustment problems, will serve as a nucleus for permanent research work on national defense matters."

Belgium Bids for Surplus American Equipment

Washington, Nov. 11.—The Belgian government has offered to purchase from the war department 197 locomotives, Belgian consolidated type; 24 locomotive cranes, 1000 high side gondolas, and 10 gasoline locomotives for $6,028,000. The negotiations are in progress in connection with the war department's disposal of surplus property.

The value of 27,652 contracts suspended by the department up to Oct. 18 is estimated at $3,883,802,000, an increase of approximately $45,000,000 over the estimate of the previous week. In the last two weeks the value of suspended contracts increased more than $200,000,000. As a result of this, the per cent liquidated is less than previously reported, 54.6 per cent for the week ended Nov. 1, as compared with 55 per cent for the previous week and 56 per cent for the week ended Oct. 11. The total number of contracts liquidated up to Nov. 1 was 22,378, with a value of $2,119,156,000. The per cent of liquidations of the total suspensions was 80.6, representing 54.6 per cent in value. Of the 22,378 contracts liquidated, the saving effected was $1,864,742,000. It cost $253,414,000 to secure the relinquishment of these contracts. In addition, partial payments in liquidation on other contracts amount to $70,351,000, making a total of $323,765,000 paid in liquidation up to Oct 18. There are 5274 contracts remaining to be liquidated.

Offer Employes Stock and Vote in Company

Profit sharing is being tried out by a number of companies in the iron and steel and shipbuilding industries of Great Britain, one of the latest experiments in this direction being made by W. Somers & Co., of Haywood Forge, Halesowen, manufacturers of marine forgings. The company which employs 700 persons and which never has had a strike offers 50,000 participating preferred shares at $2.40 each, entitling the holders to a fixed cumulative dividend of 6½ per cent, the dividend being payable before a dividend is paid to the ordinary shareholders. After the latter have received their dividend, it is said the employes holding the preferred shares will share on a pro rata basis with the holders of the ordinary shares in any further distribution. Employes holding shares will be permitted to vote at the meetings of shareholders. The company has explained that the plan will have no influence in the payment of wages.

Trade Unionism Will Fail, Says Schwab

Chicago, Nov. 11.—Charles M. Schwab, president of the Bethlehem Steel Corp., speaking before the Pennsylvania Society of Chicago recently, said he is a friend of labor but the opponent of trade unions. He also claimed that American workingmen have not received their just share of the profits of their labor during the past 25 years.

"Unionism," he said, "devises artificial means of restricting the productiveness of the workingman and will ultimately fail of itself. Efficiency means greater production and unionism opposes efficiency. One reason why German efficiency became a byword was because the German workman had learned to produce a full day's work for a day's pay. Some other means than unionism must be invented before full justice can prevail."

Company To Sell Electric Mine Equipment

For the purpose of carrying on a manufacturers' agency to sell and erect for mines such units as power plants, substations, ventilating fans, pumps, locomotives, etc., the Kallmerten & Warner Electric Co., 120 Lovell street, Charleston-Kanawha, W. Va. has recently been incorporated.

Capital stock is $10,000 and the officers follow: President and treasurer, G. E. Warner; vice president and general manager, O. W. Kallmerten; secretary, Ira W. Belcher. The company also sells transformers, motors, small light plants, lamps, etc., and is equipping its shop with machinery to make armature coils, rewind and rebuild motors, armatures, field coils, transformers, etc.

Shipments Low

In Refractories and October Was Smallest Month—Situation Improving

Pittsburgh, Nov. 11.—Shipments of refractories in October, due to strike conditions at the steel plants, were the smallest of any month in some time. Manufacturers shipping to steel plants where the bricklayers were all organized and where the response was quite general to the strike call of Sept. 22, were especially hard hit, and even the companies whose business is with iron and steel manufacturers employing nonunion bricklayers, suffered heavily in the matter of specifications. Shipment by some of the latter fell as low as

Refractories

(Per 1000 f. o. b. works)

FIRE CLAY BRICK (First Quality)	
Pennsylvania	$36.00 to 41.00
Ohio	36.00 to 38.00
Kentucky	36.00 to 41.00
Illinois-Missouri	30.00 to 40.00
FIRE CLAY BRICK (Second Quality)	
Pennsylvania	$30.00 to 35.00
Ohio	20.00 to 25.00
Illinois-Missouri	25.00 to 30.00
SILICA BRICK	
Pennsylvania	$40.50 to 45.00
Chicago	45.50 to 50.50
Birmingham	46.50 to 51.50
MAGNESITE BRICK (Per Net Ton)	
9 x 4½ x 2½	$80.00 to 85.00
CHROME BRICK (Per Net Ton)	
9 x 4½ x 2½	$80.00 to 90.00
BAUXITE BRICK (Per Net Ton)	
55 per cent.	$ 40.00 base
76 per cent.	100.00 base

35 per cent of capacity, while some plants, notably those in Ohio, found it necessary to suspend a part of the time because of a lack of shipping instructions.

Conditions show some improvement this month, for with the breaking up of the steel plant strike and the return to work of a number of the men who have been out, steel plants and blast furnace interests are in better shape to take in brick, both for early use and for stocking. Most of the larger makers of refractories have their own coal mines and are unaffected by the coal miners' strike, but with the smaller companies this is not the case although practically all of them have some reserve supply of fuel and operations will not be affected unless the tie-up of the mines is protracted. Some difficulty is being experienced in getting a supply of open-top cars because of the placing of this equipment in the coal service.

Prices of all kinds of refractories are holding at the levels of the past few months and the market can be described as firm, especially on magnesite brick, production of which is restricted because a car shortage is holding up the movement of magnesite from the Far West.

British Exports Small in Tonnage, High in Value

The British board of trade returns for September show that Great Britain is making slow recovery in the export department. With a few exceptions, the iron and steel industries made a poor showing, especially when values are considered. The enormous increase in value as compared with the increase in tonnage is significant.

During September the value of British imports was $713,400,355, or 51.61 per cent more than the total for the same period last year. British exports for the month totaled $319,201,896, an increase of 65.62 per cent. For the nine months the value of imports was $5,599,715,793, an increase of 20.35 per cent. Exports for the nine months totaled $2,598,472,889, an increase of 44.68 per cent.

Iron and steel and manufactures thereof exported by Great Britain in September amounted to 188,906 tons compared with 108,794 tons in September, 1918, while the value was $26,103,576 against $12,659,222. For the nine months the quantity was 1,596,315 tons, against 1,237,844 tons, and the value $214,147,944 against $133,361,980. The quantity of coal exported was 2,677,189 tons, against 2,792,742 tons exported in September, 1918, and in the nine months 7,732,919, against 4,552,799.

Mine Officers to Meet

Mine superintendents and officials of the country will meet in Pittsburgh on Dec. 3 and 4 to hold a mining institute at which operating and scientific problems of the industry will be thoroughly discussed. The speakers include R. Dawson Hall, editor of *Coal Age*, New York; Dr. G. H. Ashley, state geologist, Harrisburg; Dr. A. A. Hammerschlag, president of Carnegie Institute of Technology; Dr. John A. Brashear, Harry Kreisinger, fuel engineer of the bureau of mines, Pittsburgh, and Prof. H. C. Ray, of the University of Pittsburgh.

Australian Steel

Output Retarded by Seamen's Strike—Operations Start at New Works

(*Special Correspondence*)

Newcastle, N. S. W., Australia, Oct. 14.—Operations have commenced at the Australia Nail Co.'s new works at Waratah. The company's former operations were confined to Melbourne, but the new works at Waratah are of far greater magnitude. The company installed its first wiredrawing plant in Melbourne several years ago for use in connection with its nail works. Owing to the importation of cheap German-made wire in 1913 many local mills were closed down, but in 1915 the works were enlarged and operations again started. Until 1918 the company imported wire rods from America. The new works have a floor area of over three acres.

The report of the Newcastle Steel Works for four weeks ending Aug. 20 states that production was seriously retarded owing to the seamen's strike. The by-product ovens produced 2165 tons of coke, 20,764 gallons of tar and 28 tons of sulphate of ammonia. Production of ferromanganese amounted to 365 tons. The open hearths were shut down for repairs. The blooming mill was shut down on Aug. 8. The rolling and finishing mill rolled 100 tons of plates. The 18-inch merchant mill produced 2487 tons; the 12-inch mill 606 tons, and the 8-inch mill 276 tons.

The Newcastle works of the Broken Hill Proprietary Co., also was affected considerably by the strike. In the four weeks ending July 23 the production was as follows: Coke, 8305 tons; tar, 101,289 gallons; sulphate of ammonia, 130 tons; pig iron, 6835 tons; ferromanganese, 366 tons; steel ingots, 9914 tons. The blooming mill produced 10,055 tons; rolling and finishing mill, 6692 tons; the 18-inch merchant mill, 2344 tons; 12-inch mill, 616 tons and the 8-inch mill, 145 tons.

The city council of Sydney has accepted the tender of Babcock & Wilcox, Ltd., for a boiler house with chain grate stokers, at a cost of £220,438.

Recently the commonwealth government obtained an option on the iron deposits of Blythe river, Tasmania, and experts were appointed to estimate the possibilities of the field and report on the subject of its exploitation. It is now announced that the government will not exercise the option to purchase but will leave the mine which is now opened up in private hands.

Men of the Iron Trade

Personal News of a Business Character Regarding the Men of Affairs of the Industry

PAUL B. MORGAN, president and treasurer of the Morgan Construction Co., Worcester, Mass., has been appointed chairman of the executive committee of the alumni of Worcester Polytechnic institute, Worcester, Mass., having in charge the raising of a $1,500,000 endowment fund. Other members of the committee are Maj. Victor E. Edwards, vice president of the Morgan Construction Co.; George I. Rockwood, president of the Rockwood Sprinkler Co., of Massachusetts; Aldus C. Higgins, treasurer and general counsel of the Norton Co., and Lieut. Com. E. Howard Reed, vice president of the Reed & Prentice Mfg. Co., all of Worcester. R. Sanford Riley, president of the Sanford Riley Stoker Co., Worcester, has been appointed chairman of a committee to work with New England industries in connection with the campaign.

Eric H. Fors, a mechanical engineer for the Morgan Construction Co., Worcester, Mass., will sail from New York on the S. S. BALTIC of the White Star line, Nov. 15, for Liverpool, whence he will go to Sheffield, Eng., to assist A. T. Bloom, another engineer of the company on several contracts secured by the Morgan Construction Co. since the war. He expects to be away a year.

J. G. Hallas has resigned as purchasing agent of the Duquesne Steel Foundry Co., Pittsburgh and Coraopolis, Pa. His successor is M. P. Emmerich.

Lyon Smith, formerly of Brookline, Mass., has been made superintendent of the York Ferroalloys Co., York, Pa.

Frank M. Welsh, formerly New York Resident manager of Hickman, Williams & Co., Inc., has become identified with Knapp & Baxter, New York City, export brokers.

Arthur Phillips recently resigned as metallurgist for the Bridgeport Brass Co., Bridgeport, Conn., to become assistant professor of metallurgy at Yale university.

Dr. C. J. Byrne, Worcester, Mass., has been appointed chief surgeon and medical director to supervise the four hospitals of the Clinton-Wright Wire Co., and Worcester and Spencer, Mass. Dr. J. P. Schneider will have charge of the same work in the Palmer, Mass., division, and Dr. C. W. Abbott in the Clinton, Mass., division of the company.

N. B. Folsom who for several years was assistant treasurer of the Brier Hill Steel Co., Youngstown, O., has been appointed treasurer of that company to succeed John Stambaugh.

Rolland C. Allen resigned recently as state geologist of Michigan and has been appointed vice president of the Lake Superior Iron Ore association, Rockefeller building, Cleveland.

Frederick K. Kett, who until recently was affiliated with the New York Shipbuilding Corp., Camden, N. J., has accepted a position with the Compania de Minas de Fierro las Truchas, Manzanillo, Mexico.

J. H. Nead, who during the war served as captain in the ordnance department of the army in this country and in France, has become affiliated with the American Rolling Mill Co., Middletown, O., as metallurgist.

E. Clyde Tousley, who resigned recently from the Ohio Steel Products Co., Niles, O., has accepted a position with the Cambria Steel Co., Johnstown, Pa. Mr. Tousley formerly was in charge of sales extension for the Trumbull Steel Co., Warren, O.

M. Davis, of the H. H. Robertson Co., Pittsburgh, presented a paper on "Roofing Materials for Industrial Plants," at the bi-monthly meeting of the civil section of the Engineers' Society of Western Pennsylvania, held at the Union Arcade auditorium, Tuesday evening, Nov. 11.

William B. Curtis ,who for the past few years specialized on sales of conduit for the Youngstown Sheet & Tube Co., Youngstown, O., has resigned to become president and treasurer of the Steelduct Co., a recently organized company with offices at 618 Dollar Bank building, Youngstown, O.

E. L. Messler, president of the Eureka Fire Brick Works, Mt. Braddock, Pa., has been placed in charge of the recently established office in Pittsburgh, 1507 First National bank building. Mr. Messler served as captain of the twenty-first engineers on the Meuse and other fronts in France, during the war.

Philip E. Wright, for many years sales agent for the pig iron output of the Thomas Iron Co. in the Philadelphia and New York territories, has terminated this connection, effective Dec. 31. Mr. Wright will retain his Philadelphia and New York offices and will sell Pennsylvania and Virginia irons. In addition, he will continue to sell foundry and furnace coke.

E. Arthur Tutein has been made exclusive sales agent in Philadelphia and New York territories for the Thomas Iron Co., Hokendauqua, Pa. His Philadelphia headquarters are in the Finance building, South Penn square, and the address of the New York office is 1419 Broad Exchange building, Broad street. Mr. Tutein will continue to represent the company in Boston with offices at 50 Congress street.

Eugene Schneider, head of the French trade mission now touring the country under the auspices of the chamber of commerce of the United States, will have occasion to recall the visit to Pittsburgh. Among other courtesies extended to the French steel manufacturer on the visit of the mission to that city, he was extended the freedom of the city by Mayor Babcock; was given the honorary degree of doctor of science of the University of Pittsburgh and will carry back a flag of the city of Pittsburgh to be flung to the breezes at the Creusot works.

M. E. Allen has become affiliated with the reopened Chicago office at 1228 Peoples Gas building, of the Federal Bridge & Structural Co., Waukesha, Wis. He is contracting engineer in charge of sales and formerly was in charge of sales for the Central States Bridge Co., Indianapolis. Later he was connected with the Baily & Allen Co. Mr. Allen's most recent connection was as assistant general manager of the Birmingham Steel Corp., Birmingham, Ala., where he was in charge of the construction of a large steel fabricating plant built and owned by the Mobile Shipbuilding Co., Mobile, Ala.

Men of the Machinery Trade

Personal News of a Business Character Regarding the Men of Affairs of the Industry

WILLIAM L. MOORHEAD recently resigned as vice president of the Duquesne Electric Mfg. Co., Pittsburgh, to become affiliated with Henry T. Parsons, to do a general machinery business under the name of Parsons-Moorhead Machinery Co., 309 Hostetter building, 237 Fourth avenue, Pittsburgh. Mr. Parsons has been doing a general machinery business in that city for several years.

Sir Thomas White, formerly Canadian minister of finance, has been elected a director of the Steel Co. of Canada, Ltd., Hamilton, Ont.

Stuart C. Lawson, formerly of Madison, Wis., now is identified with the sales department of the Otis Elevator Co., New York, as chief estimating engineer.

A. Brauer, automobile body designer for the Mansfield Steel Corp., Detroit, has been appointed assistant general manager in charge of production.

Frederick Baker has been placed in charge of the new Cleveland office in the Engineers' building, of the Poole Engineering & Machine Co., Baltimore.

F. E. Barth, formerly with the L. L. Harr Corp., New York, production engineer, has become office manager of the Graton & Knight Mfg. Co., Worcester, Mass.

D. B. Clark, district manager at 435 Stock Exchange building, Chicago, for the Cleveland Milling Machine Co., Cleveland, has had added to his territory the Indianapolis district.

Dr. Charles Proteus Steinmetz, chief construction engineer of the General Electric Co., spoke on the subject, "The Engineer and Education," before the Park club in Pittsfield, Mass., Nov. 6.

C. R. Norton, formerly general manager of the Packard Motor Car Co., Detroit, has become vice president and general manager of the General Top Co., Cleveland, a $1,000,000 company of which Christian Girl, of the Standard Parts Co., is president.

F. C. Wallace, of Pittsburgh, has been persuaded by the directors of the Canadian Locomotive Co., Kingston, Ont., to withdraw his resignation as president of that company and to continue in office. He has been granted a 6-months leave of absence.

W. C. Vrooman, who since last July, has been office manager for the Cleveland-Duplex Machinery Co., 1224 West Sixth street, Cleveland, has become identified with that company's sales force and will cover the western district of the city for the present.

Walter C. Chrysley, vice president and general manager of the General Motors Corp., and formerly president of the Buick Motor Co., Flint, Mich., resigned on Nov. 1. He recently returned from a visit to Europe with other General Motors officials after an investigation of foreign trade conditions.

R. J. Schuler, former purchasing agent for the Detroit Gear & Machine Co., Detroit, has been promoted to be supervisor of cost production and purchases. C. E. Messerschmidt, formerly assistant purchasing agent, succeeds Mr. Schuler as purchasing agent. L. E. Stevens has been appointed assistant purchasing agent.

William Gardner, formerly manager of sales of the rolls department, United Engineering & Foundry Co., Pittsburgh, was chosen second vice president at the company's recent annual meeting. Last week's issue incorrectly reported that K. C. Gardner had been promoted to the second vice presidency. He remains as general manager of sales.

Clarence E. Whitney, president of the Whitney Mfg. Co., Hartford, Conn.; William C. Fisher, secretary of the Russell Mfg. Co., Middletown, Conn.; Samuel Ferguson, vice president of the Hartford Electric Light Co.; John H. Goss, general superintendent of the Scoville Mfg. Co., Waterbury, Conn., and Sumner Simpson, president of the Raybestos Co., Bridgeport, Conn., have been nominated members of the board of directors of the Connecticut chamber of commerce, the election of which wil ltake place at the annual meeting in New Haven, Nov. 20.

D. V. Williamson, vice president of the Detroit Engineering society and formerly of the Detroit Gear & Machine Co., with Jervis B. Webb and T. M. O'Connell, of the Johns-Manville Co., have organized the Williamson-Webb Co., to represent the Geo. B. Bailey Co., of Chicago, and the Southwark Foundry & Machine Co., of Philadelphia, in Michigan. Offices are at 1646 Woodward avenue.

Clifton R. Hayes, manager of the Fitchburg Gas & Electric Co., Fitchburg, Mass., has been appointed by Charles H. Tenney & Co., Boston, engineers and managers of gas and electric light plants, engineering manager of their system from Maine to New Jersey, with headquarters in Boston. Mr. Hayes is president of the New England section, National Electric Light association.

B. E. Thompson, of Beaver, Pa., who is connected with the Rochester Clay Products Co., was elected president of the United States Cement Tile Co., Pittsburgh. Other officers follow: Vice president, H. N. Trimble, of the H. N. Trimble Steel Co., Pittsburgh; secretary, G. R. Mueller, Beaver, Pa.; treasurer, C. L. Kirk, Pittsburgh; superintendent, W. A. Ault, New Castle, Pa. The general offices of this company, formerly located at New Castle, have been moved to Pittsburgh, now being located at 2223 Farmers bank building. This company manufacturers a reinforced cement roofing tile.

Albert E. Newton, vice president and general manager of the Reed-Prentice Co., Worcester, Mass., and president of the National Machine Tool Builders association, has been elected a director and president of the Hobbs Mfg. Co., Worcester, manufacturer of paper box machinery, etc., to succeed Charles B. Manville, Pleasantville, N. Y., founder of the H. W. Johns-Manville Co., resigned. Other new officers of the Hobbs Mfg. Co. are Clarence J. Abbott, treasurer; and Roy J. W. Ashey. Mr. Abbott succeeds F. Stewart Andrews, founder of the Lancaster Wire Co., England, who recently resigned to return to New York. These three new officers also are to be elected to the same positions in the National Sales Machine Co., of which the Hobbs Mfg. Co. is a subsidiary.

Wind Up Season's Ore Activity

Shipments from Lake Superior District to End by Nov. 20, Earlier Than Anticipated, Due to Cold Weather and Congestion at Lower Lake Ports—Winter Work to Proceed on Extensive Scale—Millions Paid in Taxes

(*Special Correspondence*)

DULUTH, Nov. 10.—Mine operators and iron and steel interests in this district are optimistic regarding the outlook in the industry, despite the unsettled situation created by the steel strike. Business interests here are hopeful that labor difficulties will not interfere with the plans of the United States Steel Corp. for improvements and extension of plants during 1920. Rumors are current that arrangements are being made for proceeding with the building of the four plants for the manufacture of finished steel products, requiring an expenditure of more than $10,000,000, in accordance with the understanding Duluth business men had a year ago with E. H. Gary, chairman of the corporation.

The working force of men at the Minnesota Steel Co.'s plant here has been gradually increased during the last few weeks until it now numbers approximately 2000. Additional machinery has been installed in some of the departments and the tonnage of semifinished steel being shipped out to consumers in the southern part of the state is much larger than usual. A few months ago the force did not number more than 1000 men, and the products of the furnaces were accumulating.

Season's Output Estimated

Final shipments of ore are being made, and the season's tonnage is regarded as satisfactory. Some operators here estimate the season's shipments will be about 45,000,000 or 46,000,000 tons as compared with over 62,000,000 last year. The season is closing earlier than anticipated a few days ago as the result of cold weather, necessitating the employment of larger crews at the docks to thaw out the ore, and the congestion at lower lake ports, due to the inability of furnaces to accept the ore. The coal miners' strike was another factor making for a speedy termination of shipments.

The Oliver Iron Mining Co., however, decided some time ago to conclude shipments Nov. 15. The company's operations on the ranges were carried through steadily from the opening of the season with a force of approximately 12,000 men.

Beyond a few scattering loads to go down all the independents shipping from the docks at the head of the lakes have also closed down. E. D. Brigham, regional director of the railroad administration, fixes Nov. 20 as the date for winding up the shipping season.

From present indications winter work on the Mesabi and Vermillion ranges will be on a fairly extensive scale. It is intimated that the Oliver company will maintain a force of nearly 12,000 men at its various mines and that among others the M. A. Hanna & Co., the Republic Iron & Steel Co., the Interstate Iron Co., Tod-Stambaugh Co., Shenango Furnace Co. and the McKinney Steel Co. will employ substantial forces and do considerable stockpiling.

It has been announced here that M. A. Hanna & Co. have taken over the Judson mine at Crystal Falls, Mich., and will operate it next season. That property formerly was controlled by the Judson Mining Co., with headquarters at Chicago, and it was operated during the past season.

The Bourne location within the city limits of Hibbing is being built up with homes for the employes of the Bourne mine, operated by the Cleveland-Cliffs Co. Sinking of the shaft at the mine has been in progress for several months, and it is thought the mine will ship out a good tonnage next season.

Owners of manganiferous ore properties on the Cuyuna range are not discouraged over the dullness of the past season. Some of the mines are conceded to be capable of producing a marketable grade of ore. John A. Savage & Co. have faith in their Sagamore property on the Cuyuna range. It is estimated that the Winston-Dear Co. stripped 600,000 cubic yards of overburden at the Sagamore mine during the past season. Some shipments of the ore were made to eastern furnaces and encouraging reports regarding them are said to have been received. The Croft mine of the Cuyuna range also operated by John A. Savage & Co., shipped up to the end of the season, and development work is being continued.

The American Manganese Mfg. Co. shipped its final cargo of ore from its Cuyuna-Duluth mine last week, the season's shipments approximating 90,000 tons.

Tax payments aggregating $4,153,251.67 were made by the United States Steel Corp. and its subsidiary companies to the treasurer of St. Louis county at the end of last month. The remittance covered all the corporation's holdings in the country and was in payment of the realty tax for the last half of 1918. They covered taxes on mining lands in St. Louis county amounting to $4,016,773.88; land in Duluth, $72,875.86; the Universal Portland Cement Co.'s lands in Duluth, $9,473.68; Day mines, $30,318.93; the Morgan Park Co.'s lands, $20,365.90, and $3,443.52 for the Wolvin building in which are located the offices of the Oliver Mining Co., Universal Portland Cement Co., the Duluth, Missabe & Northern railroad, the Duluth & Iron Range railroad, and the American Bridge Co., all subsidiaries of the corporation. Another large check was from the Tod-Stambaugh Co., for $83,204.75, to cover taxes on properties it holds in St. Louis county.

Disapprove Tax Tonnage Proposal

The Hibbing Commercial club has taken the lead in connection with the campaign to acquaint the people of the state with the facts in regard to the tonnage tax proposal. R. W. Hitchcock, a member of the Minnesota state legislature, contends that the imposition of the tonnage tax would result disastrously to the mining interests by checking prospecting for ore. He states that if the tonnage tax is levied iron mining in northern Minnesota will be slowed down to such an extent that Hibbing's present $90,000,000 taxable assessment will be reduced to about $3,000,000, and that similar conditions will be brought about on every range.

The action of the Oliver Iron Mining Co. in transferring the old business portion of Hibbing to its new townsite at Alice continues to stir up opposition in some quarters.

Canadian Industry

Seriously Affected by Steel Strike in This Country—Supplies Short

Toronto, Ont., Nov. 10.—The automobile and agricultural implement industries, which for some time were very active, are seriously affected by the steel strike in the United States. They are extensive consumers of sheets and other lines and supplies are running short so that there is a general slackening of activity in these lines. Shipbuilders constructing vessels for Canadian merchant service have supplies of plates on hand for present requirements. Canadian mills rolling sheets, plates and bars are being speeded up to supply the demand. Mark Workman, president, the Dominion Steel Corp., hopes that the plate mill of the company will be in operation early in 1920, and states that the demand for steel products is improving.

The Ford Motor Co., of Canada, has purchased the plant of the Dominion Forge & Stamping Co., situated near its plant at Ford City, Ont. The Dominion plant has been engaged in production of fenders, sheet metal work and frames for the Ford company. The latter will now manufacture the parts, while the Dominion company will continue to turn out forgings and other parts in its second plant, which is not included in the purchase. An inventory of the plant sold is being taken and it is expected that the valuation will be between $700,000 and $800,000.

The directors of the National Steel Car Co., of Hamilton, Ont., have decided to recommend to the shareholders that a proposal made by a syndicate of New York capitalists, headed by R. J. Major, for the reorganization of the company, be accepted. The syndicate proposes to put up sufficient capital to operate the plant to capacity and to introduce more aggressive management. A general meeting of shareholders to consider the matter has been called for Nov. 12.

Furnace to Resume

Completion of repairs of machinery and plant of the Chattanooga Iron & Coal Corp., Chattanooga, Tenn., recently absorbed by the Iron Products Co., New York, within the next 90 days, will permit operation of the blast furnace which has been closed down since the signing of the armistice. W. W. Taylor, an engineer formerly with the Equitable Trust Co., New York, has been made vice president and manager of the property. W. R. Cooke will be the chief chemist. The Chattanooga company was organized in 1913 with an authorized common stock of $1,500,000 and preferred stock of $1,000,000. C. E. Buek was president and A. W. Chambliss vice president. The company owned and operated one furnace stack at Chattanooga, which was built in 1905-06. It had ore mines at Estelle, Ga., and bee-hive ovens at Dunlap, Tenn., both of which have been taken over. The annual capacity of the furnace is 75,000 tons.

The Domestic Coke Corp., Cleveland, will complete its 60-oven plant at Fairmont, W. Va., at an early date, says *West Virginia Mining News.*

Open New Office

J. F. Corlett & Co., Cleveland, mill representatives, have made arrangements effective Nov. 1, to open a Cincinnati office which will serve the territory in that city and vicinity. The Cincinnati office will be located at 607 First National bank building and will be in charge of W. B. Harris who up to several years ago was the sales agent of the Worth Bros. Co. in that district. J. F. Corlett & Co. are sales representatives of the Lukens Steel Co., the Eastern Steel Co., the Monongahela Tube Co., the Alan Wood Iron & Steel Co., the Champion Rivet Co. and the Franklin Steel Works.

Obituaries

DANIEL ASHWORTH, burgess of Crafton, Pa., who as a boy worked in the mills of the Jones & Laughlin Steel Co., and who from 1884 until 1901 was identified with the Carnegie Steel Co. as an expert on steam power, died at his home in Crafton, Nov. 8. He was born in Lancashire, Eng., 78 years ago, and came to this country with his parents when a lad of nine years. Early in life became identified with the glass industry, serving his apprenticeship as a designer of molds in the glass works of James B. Lyons & Co. He followed this business in various parts of the country until 1882, when he became superintendent of steam engine construction for the Lane & Bodley Co., Cincinnati. Returning to Pittsburgh in 1884, as a consulting engineer he did much work for the Carnegie Steel Co. He was one of the organizers of the American Society of Mechanical Engineers and a life member of that body. He also was a member of the Engineers' Society of Western Pennsylvania and the National Association of Steam Engineers. He served in both the army and navy during the civil war and had filled various public offices.

William A. Stanton, general manager of the General Refractories Co., formerly a resident of Pittsburgh, died recently in England, where he had gone on a business trip for his company.

George J. Capewell, founder of the Capewell Horseshoe Nail Co., died last week in Hartford, Conn. Mr. Capewell is best known as the inventor of machines for manufacturing horseshoe nails. He was born in England and came to this country in 1846 at which time he started in making firearms in Woodbury, Conn.

Harry W. Cobb, for several years employment manager of the Heald Machine Co., Worcester, Mass., until illness prevented his continuing, died in Memorial hospital in that city, Nov. 3. He was formerly connected with the Wyman-Gordon Co., Worcester.

Charles H. Holmes, at one time connected with the Hillman coal interests and lately general auditor of the Wheeling & Lake Erie railroad, died at his home in Cleveland, Oct. 31. He was a resident of Pittsburgh for a number of years and before going with the Wheeling & Lake Erie railroad was assistant to B. A. Worthington, vice president of the Wabash railroad, east of Toledo.

Edwin R. Stroughton, metallurgical engineer of Detroit, aged about 55, who was resident agent in Detroit for a number of years for M. A. Hanna & Co., Cleveland, died Nov. 7 in Atlantic City, following an illness from which he suffered for the past year. He was buried in Baltimore on Nov. 10. Mr. Stoughton also represented the Detroit Furnace Co., the Detroit Iron & Steel Co., and was a director in the Detroit Twist Drill Co.

Here and There in Industry

Live Information Which Records the Expansion of Various Lines of Productive Enterprise

ANNOUNCEMENT is made that the AllisChalmers Mfg. Co., Milwaukee, has completed additions costing $3,600,000 to its main works at West Allis, Wis., which will be devoted exclusively to the manufacture of three models of farm tractors which the company has been producing for several years. The main tractor shop cost $3,000,000 and a foundry used only for making castings for this purpose represents an additional investment of $600,000. The capacity will be about 15,000 machines a year, but it is intended to limit the output to 7500 or 8000 during 1920, unless the demand is found to be of sufficient proportions to extend production. The Allis-Chalmers Mfg. Co. has been making tractors for about five years, but activity along this line was shut down by the war. The company has shipped tractors to France and to Portugal, and one order of six went to Tunis, Africa. The buyers of these have ordered 40 additional. The Allis-Chalmers Mfg. Co., with its present facilities, is regarded as the third largest manufacturer of tractors in the United States, being outranked only by the General Motors Corp. and Henry Ford & Son. Since the main tractor works of the General Motors Corp. are located at Janesville, Wis., the state of Wisconsin probably is the largest producer of tractors in the country.

* * *

ORDERS for steel mill bearings for the new 3-high 28-inch billet mill to be installed by the Bethlehem Steel Co., at its Saucon plant, Bethlehem, Pa., have been placed with the Hyatt Roller Bearing Co., New York. The mill is being built by the Morgan Engineering Co., Alliance, O.

* * *

FOR the purpose of reclaiming scrap metals, particularly aluminum, the Standard Metals Refining Corp., 216 to 220 West South street, South Bend, Ind., has been incorporated recently. All equipment has been purchased for the present but the erection of a new building is contemplated next spring. The officers are: M. L. Hurwich, president and treasurer; Richard Oglesbye, vice president and secretary, and C. C. Walters, general manager and metallurgical engineer.

* * *

CONTRACTS have been awarded by the Sioux Falls Metal Culvert Co., Sioux Falls, S. Dak., for the erection of a works addition, 90 x 130 feet. C. N. MacMillan, general manager, states that at this time the company is not in the market for any new equipment but probably will be at a later date.

* * *

HARROWS for southern agriculturalists will be manufactured at Tarboro, N. C., by a $100,000 company which will be organized by M. G. Mann, T. T. Thomas and M. S. Brown, the first named to be president, it is announced. The Eclipse Harrow Mfg. Co. is the name of the company.

* * *

AN AGREEMENT has been made by the Wellington Machine Co., Wellington, O., builder of clay-working machinery to manufacture an automatic brick dumper. This particular contract is one of the largest handled by the Wellington Machine Co. New employes have been put on and new machinery has been purchased.

* * *

THE Ajax Auto Parks Co., Racine, Wis., through L. B. Guffith, secretary, has advised that the company is building an addition to its plant, 65 x 120 feet, which will be used for the manufacture of pressed steel lifting jacks. Mr. Guffith further advises that new equipment, including punch presses and transmission apparatus, has been ordered.

* * *

EXPANSION of the business of the Eureka Fire Brick Works, Mt. Braddock, Pa., particularly in connection with products used by blast furnaces, it has been necessary to open an office in Pittsburgh, 1507 First National bank building, with E. L. Messler, president, in charge. Under the superintendency of H. Watson, the Mt. Braddock plant is running full and has been placed in shape to take care of the company's increasing sales.

* * *

OFFICES have been established by the Webb Electric Furnace Corp., at 36 Church street, New York City. It has taken over the manufacture and sale of the furnace developed by the Old Dominion Iron & Steel Corp., Richmond, Va., two of which have been in successful continous operation at the plant of the Old Dominion corporation for the past three years.

* * *

WORK has just been started on a concrete addition to the Ross-Meehan Foundry Co.'s plant at Chattanooga, Tenn. The building is an addition to the malleable iron department. It is of the most approved construction and is one story. The addition will increase the capacity of the department by 8000 tons a year. The present capacity is about 12,000 tons.

* * *

CAPITALIZED at $250,000, the Pierce Fuse Corp. of Canada, Ltd., Bridgeburg, Ont., recently was incorporated to manufacture renewable electric fuses. At present the company does not plan to erect a shop as it has rented ample space. Officers of the company are: President, W. N. Pierce; vice president, F. A. Myer, and secretary, B. C. Candee.

* * *

SINCE its quarters were found to be inadequate for its present business the Wappat Gear Works, Hamilton avenue, Pittsburgh, has increased its capital stock. Land has been acquired and a large modern building of steel and glass construction is being erected. The new plant which will be placed in operation some time during December, is located in Meade street, near Braddock and Penn avenues. With its present equipment and the additions to it which are being made, the Wappat company will be in an improved position to produce machine tools, special machinery and cut gears. F. W. Wappat is president and manager.

Here and There in Industry

Live Information Which Records the Expansion of Various Lines of Productive Enterprise

OFFICIALS of the Prentiss Tool & Supply Co., New York, and Clayton O. Smith, formerly sales manager of the Norton Grinding Co., Worcester, Mass., are to take over the business of the O. S. Walker Co., Worcester, builder of grinding machines and magnetic chucks. Oakley S. Walker is president and treasurer, and Isaac F. Williams, secretary and manager, of the company. Mr. Walker has been ill for some time, which is the reason for the change in ownership. It is proposed to organize a new corporation. Among those interested in it are William F. McCarthy, manager of the Boston office of the Prentiss company, and Leon Goodspeed, of the New York office. Mr. Williams will remain with the new company.

* * *

INCORPORATION of a subsidiary of the Stromberg Electric Co., Chicago, known as the Stromberg Time Recorder Co. of Canada, Ltd., has been effected at Toronto, Ont. The company will carry on the Canadian business of the Chicago firm. Officers are: President, E. E. Spencer; general manager and treasurer, C. W. A. Woodburne, and secretary, H. F. Testin.

* * *

THE Plamondon Mfg. Co., 24 North Clinton street, Chicago, manufacturer of transmission machinery, has bought a tract, 200 x 1100 feet, at Western boulevard and Fifty-second street. Work has been started on the first unit, a 1-story building, 200 x 500 feet, which will cost $250,000. This company now occupies a 4-story building, 100 x 300 feet, which location it has held during the past 59 years.

* * *

THE Davenport Machine Tool Co., Inc., Rochester, N. Y., has been formed by W. S. Davenport, who formerly was engaged in building screw machines at New Bedford, Mass., and Clayton R. Burt, formerly connected with the Barber-Colman Co., Rockford, Ill., and more recently with the Russell Motor Car Co., Toronto, Ont., and Buffalo, N. Y. A plant has been bought at Rochester with part of the necessary equipment, and the remainder is being obtained in the market. Mr. Davenport is president, Mr. Burt vice president and general manager, and A. T. Hatch is secretary and treasurer.

* * *

SAMUEL T. HOBBS, for many years connected with the management of the Hobbs Mfg. Co., Worcester, Mass., and for the past five years sales manager of its lock washer department, has resigned to engage in business for himself. He is organizing a corporation which will be capitalized at $50,000 to make lock washers under the name of the Hobbs Lock Washer Co. A Worcester factory will be leased.

* * *

THE Claflin Oil Derrick Supply Co. with many prominent Connecticut manufacturers at its head, has been organized in Hartford, Conn., to build steel tubular section derricks. The company contemplates turning out 25 of the standard derricks per month, and arrangements already have been made whereby several of the Hartford machine manufacturers will make many of the smaller parts.

* * *

PLANS have been prepared by the Lakeside Forge Co., Erie, Pa., for an addition to its forge shop, in which it will install 12 new hammers. It has just completed an addition to its machine shop and has installed with other new machinery a complete nickel-plating plant and the die and machine rooms have been greatly enlarged. All these improvements are made necessary by the increasing demand for the wrenches and tools produced by the company.

* * *

THE Thomas Furnace Co., which operates a stack at Milwaukee, is undertaking considerable repairs to its plant and expects to put it back into blast about the beginning of 1920. The stack proper is being rebuilt and enlarged, a skip hoist is being added and a pig casting machine erected. This stack has been producing low phosphorus pig iron, but so far no decision has been made as to what grade will be made when it resumes activity.

* * *

THE Illinois Motor Co., manufacturer of motorcycles and engines, 3511 Lincoln avenue, Chicago, has established itself in a new plant and is extending its activities. George S. Walter, 38 South Dearborn street, is president; L. W. Harjes, 3520 Lake Park avenue, vice president, and Harry C. Kinne, 139 North Clark street, is secretary and treasurer. The board of directors consists of these three with John S. Coonley, 220 North Desplaines street, and Walter L. Morrison, 122 South Michigan boulevard.

* * *

APPOINTED by the Pollak Steel Co., Cincinnati, New York and Chicago, as its representative in the Detroit district, the C. A. S. Engineering Co., 790 Woodward avenue, Detroit, will serve the state of Michigan as well as northern Ohio, which includes the cities of Toledo, Elyria and Cleveland. It will have charge of the distribution of locomotive and railroad forgings, marine and heavy hammered forgings, as well as the entire line of drop forgings for automobiles, trucks, tractors, etc., manufactured by the Pollak company.

* * *

ADVICES have been received from S. P. Townsend & Co., Orange, N. J., manufacturer of lawn mowers, grease guns, etc., that the company has purchased seven acres from the American Malleable Iron Co., Bloomfield, N. J., on which it plans to erect a modern plant of brick and steel construction, and to repair the buildings now standing on the property. The new works will constitute about 70,000 square feet of floor space while the older buildings will give 50,000 more. Occupation of the buildings is expected to take place in March. The company has been in business since 1897 when S. Percy Townsend started the manufacture of lawn mowers in a small factory in Bloomfield, N. J. Three years after the inauguration of the business, the plant became too small and Mr. Townsend moved to a larger works at Orange, N. J.

October Speculation is Amazing

Stock Exchange Daily Average Trading for Month Exceeded But Two Times in Past —Aggregate Capitalization for New Incorporations Break all Records—Crucible Steel Report Out—General Financial News

BY JOHN W. HILL, FINANCIAL EDITOR

WHAT many believe to have been the height of the speculative fever which has been raging with but slight interruption since last spring was attained during October when records both for incorporations of new enterprises and for transactions on the New York stock exchange reached amazing levels.

Figures compiled by *The Journal of Commerce* show that 1067 new companies were organized under the laws of the principal states last month with an authorized capital stock of $100,000 or over, involving an aggregate capitalization of $2,363,635,200, an increase over the same month last year of 1660 per cent. Since the first of the year there has been a steadily rising tide of new incorporations. Previous to October the high mark numerically had been reached in July with 1000 charters reported while September with $1,946,954,500 stood next to October in point of authorized capitalization.

For the nine months of the current year aggregate incorporations have involved the huge sum of $10,258,237,100 as compared with $2,338,722,600 and $4,024,561,500 for 1918 and 1917 respectively.

Share deals during October literally swamped Wall street and taxed its machinery severely. The daily trading average of 1,443,472 has been exceeded only two times in the history of the exchange—by the 1,486,660 shares per day in January, 1906 and by the 1,813,873 average of April, 1901. Industrial specialties, with steel shares figuring prominently in the movement, were bid up to new high levels, the price index reaching 118.92, up 7½ points for the month and nearly 40 points in advance of the low for the year existing in February. Share trading thus far this year is running ahead of 1918 by 120 per cent, while bond sales are double last year's and from three to six times the prewar average.

What Does it Mean?

The great enigma, of course, is what is the meaning of all this? Does it reflect merely the war-stimulated spirit of gambling based on the tremendous inflation of values and banking credit, or does it measure the great confidence with which those who have money to invest view the outlook for national prosperity despite the present labor clouds darkening the horizon?

Were the manifestation confined to the stock market the answer might be easier, for there is little doubt but that the gambling instinct, the lure of quick and fabulous profits—is a powerful motive behind the current Wall street activity. Yet when the test is applied to the business expansion a new light is shed upon the situation. It is true that the predominence of the oil and gas companies among the new incorporations indicates that the appeal of sudden riches is a great factor in the company investments, while of course in addition many investors have been induced to part with Liberty bonds by glib-tongued promoters of bogus or fanciful schemes. That is the unstable part of the picture.

On the other hand, it is certain that the vast majority of investors in new enterprises are hardheaded persons who are chancing their money, not in expectation of great immediate returns, but because they have an abiding faith in the ability of the country to solve its problems successfully and to go full steam ahead upon the paved road of prosperity open to it. They believe that the swelling volume of business that has hardly been interrupted by the recent great strikes is only an indication of what is in store for the country's industries within the next few years, with production far below the level of the demand in almost every conceivable line.

After every war there is a period of stimulated industrial activity and invention, the efforts of the community to make up the losses in production occasioned by the conflict. On the stock market speculation, of course, is running away with itself, but even there activity is largely based on belief in continued industrial prosperity. The activity is too strong for the financial position of the country, however, and as was predicted last week the New York federal reserve bank has raised its rediscount rates on "war paper" collateral, the object being to check speculation. With banking credit limited by the new move and call loan rates running up as high as 20 per cent on some days many believe that the pronounced upward swing of stocks cannot continue uninterrupted for long.

To Increase Capital

A special meeting of the stockholders of the Chicago Pneumatic Tool Co. has been called for Dec. 5 to authorize an increase in capital stock from 64,488 to 128,976 shares of $100 par value. Stockholders are to be offered the privilege of subscribing to new stock equivalent to their present holdings. Proceeds will be used for the retirement of outstanding bonds and all fixed charges and to increase the company's working capital. The report of the company for the nine months ended Sept. 30, shows net income after charges and taxes of $455,434.

New Crucible Officials Announce Policy

Stockholders of the Crucible Steel Co. of America, Pittsburgh, will be kept fully informed regarding the condition of their company, according to the promise of the new chairman, H. S. Wilkinson, who recently succeeded Herbert Dupuy in the annual report of the company for the fiscal year ended Aug. 31. Mr. Wilkinson and President O. H. Wharton in their statement state the company's cash and current assets will be greatly increased by the decision to complete improvements now under way, but to discontinue any further extensions or improvements at the present time.

That with iron ore investments already made and coal mines that have been opened, together with the new blast furnace and by-product coke ovens which are nearly completed, the company will have a well-rounded out plant from mines to finished material, is the assertion of the officials. Discussing the labor problem they say:

"We are pleased to report that the recent advance made in wages and the care we are taking of our em-

ployes have evidently met with their approval, and that there is a good feeling existing between your officers and men in the various plants of your company. It will be the purpose of the present management to see that reasonable hours and working conditions are granted to all of our employes and that the wages paid shall continue to be the best possible and equal at least to any in our line of industry."

The number of stockholders on Aug. 31 was 3934 of preferred owners and 946 of common, a total of 4880. The report shows net earnings after charges and federal taxes of $9,574,208 as compared with a surplus of $13,812,127 the previous year. Inventories as of Aug. 31 stood at $27,605,896, the property investment at $84,168,741 and cash at $4,536,718. The comparative income account follows:

	1919	1918
Total profits	*$14,093,005	$19,939,225
Replacements, deprec. ,etc.	4,171,489	5,759,000
Subsidiary bond interest..	347,308	368,098
Net prof.	$9,574,208	$13,812,127
Preferred dividend	1,750,000	1,750,000
Surplus	$7,824,208	$12,062,127

*After federal taxes of $8,500,000.

Otis Elevator Net Gains

The Otis Elevator Co., New York, reports net earnings for the year ended Sept. 30 of $1,423,026 after taxes and a depreciation charge of $612,788. After allowing a full year's dividend on the $6,500,000 6 per cent preferred stock there remained a balance of $1,043,026. This was equivalent to better than $15 a share on the $6,920,387 common stock outstanding, and is a decided improvement over earnings reported for the calendar year 1918, when $622,488, or $9.77 a share, was shown on the common stock. Working capital on Sept. 30 last amounted to $7,153,476, equal to about $104 a share on the common stock outstanding, and the largest working capital ever shown by the company, comparing with $5,281,962 at the close of 1918. The most notable improvement in the company's financial position is the heavy liquidation of the notes payable which amounted to only $900,000 on Sept. 30 last. At the beginning of the year the item amounted to $3,200,000, and at the close of 1917, $6,200,000.

Midvale Earnings Show a Decided Increase

A short spurt in earnings for the third quarter of 1919 is disclosed by the report of the Midvale Steel & Ordnance Co., for the period ended Sept. 30. Net profits for the three months were $3,408,359 almost four times the $946,267 earned during the previous quarter. Earnings were lower than the corresponding quarter last year, however, when $7,793,627 was earned. The surplus after charges and war taxes for the nine months of the year was $7,104,823 as compared with $24,139,411 in the same period of 1918. From the net earnings of $5,851,570 interests of $781,626 and depreciation of $1,661,585 were deducted.

The report for the third quarter, compared with the corresponding period in 1918 is as follows:

	1919	1918
Net earnings	*$5,851,570	$11,590,601
Interest	781,626	772,812
Depreciation, etc.	1,661,585	3,024,162
Net profits	$3,408,359	$7,793,627

Earnings for the nine months compiled from quarterly statements make the following comparison:

	1919	1918
*After provision for all taxes.		
Net earnings	$13,691,754	$33,474,398
Interest	2,362,327	2,351,020
Depreciation, etc.	4,224,604	6,983,967
Net profits	$7,104,823	$24,139,411

Financial Crop Ends

PLANS for the formation of a $25,000,000 wheel corporation by the merger of Michigan and Ohio interests are said to be in the making. C. B. Hayes, of the Hayes Wheel Co., Jackson, Mich., will head the combined concerns which will include seven companies, it is said.

* * *

The Mason Machine Works, Taunton, Mass., has purchased the business of the Worcester Crompton Loom Co., Worcester, Mass., and is preparing to build automatic filling changing looms.

* * *

The Eclipse Harrow Mfg. Co., Tarbora, N. C., has been organized for $100,000 for the purpose of manufacturing harrows. President M. G. Mann, of the company, T. T. Thomas and M. S. Brown are the organizers.

* * *

A new plan of organization is to be considered by a special committee of the National Steel Car Co., Hamilton, Ont. A circular of the president shows a deficiency of $1,603,184 the result of unsettled French war orders.

* * *

Under the reorganization of the Wharton Steel Co., New York, in the Replogle Steel Co., holders of 100 shares of the former will be offered 710 shares of the new company at $50 a share, it is reported. There will be no underwriting. J. L. Replogle is president of the new company.

Little Benzol

Now Available for Early Shipment—Coal Tar Products Firm

New York, Nov. 10.—Scarcity of spot benzol continues. The light supplies available at the time production was materially curtailed by the steel strike, have been absorbed, and with operations still affected, sellers have been unable to replenish stocks. Virtually the only material moving is that under old contracts. The bulk of this benzol is being consumed by the rubber industry. The market continues unchanged, although higher quotations are likely. Pure benzol is holding at 24 to 29 cents per gallon, and 90 per cent benzol at 22 to 24 cents.

Steady demand characterizes toluol and supplies, despite curtailed production, are sufficient. Prices remain unchanged at 26 to 30 cents per gallon on spot and contract. Rosin manufacturers are buying solvent naphtha in fairly good quantities, and spot and contract material is available at last week's market of 22 to 27 cents.

While the buying season is drawing to a close, the drug trade continues to purchase naphthalin in good volume. A fair amount of interest is still being manifested by the dye industry. Naphthalin is firm at 6½ to 7½ cents per 100 pounds, for flakes, and 8½ to 9½ cents for balls. Phenol is featureless with the government still offering stocks at 12 cents, f.o.b. eastern stores.

Producers of sulphate of ammonia quote the market at $3.50 to $3.75 per pound for spot and $3.40 to $3.50 for future. Nearby material, however, remains scarce.

Coke Oven By-Products

Spot

Per Gallon at Producers' Plant

Pure benzol	$0.25 to .29
Toluol	.26 to .30
Solvent naphtha	.22 to .27

Per Pound at Producers' Plants

Phenol	nominal
Naphthalin, flake	0.06½ to .07½
Naphthalin, balls	0.08½ to .09½

Per 100 Pounds at Producers' Plants

Sulphate of ammonia	3.50 to 3.75

Contract

Per Gallon at Producers' Plant

Pure benzol	$0.25 to .29
Toluol	.26 to .30
Solvent naphtha	.22 to .27

Per Pound at Producers' Plant

Phenol	nominal
Naphthalin, flake	0.06½ to .07½
Naphthalin, balls	0.08½ to .09½

Per 100 Pounds at Producers' Plants

Sulphate of ammonia	3.40 to 3.50

Present Tool Trade is Healthy

Deferred Deliveries Because of Extensive Buying Recently, Price Increases and Numerous Inquiries All Attest the Fact That Equipment Industry is in Good Condition —Action Awaited on Few Sizable Lists— Midvale Buys Nine Cranes

HEALTHY conditions, for the most part, exist at present in the machine tool trade. This is best exemplified by the deliveries on tools now being promised by manufacturers, most of whom are so filled up with orders, the best they can do is from two to five or six months. In rare cases, seven and eight months are required. Three factors are said to contribute to this condition. First: Extensive sales for many weeks past throughout the Middle West, particularly among automobile manufacturers whose tool needs seem insatiable; second, lack of sufficient working forces in makers' plants; and third, inefficient production by the forces employed. Further price increases indicate the strong basis of the equipment market. A manufacturer of wood-working machinery in Cincinnati, has brought his prices up 25 per cent to wartime levels. Dealers, particularly in the Middle West, state they are answering numerous inquiries, which generally are for one, two or three tools.

Sellers are off to a flying start in Chicago, and from appearances November will exceed October, which for some, broke all past records. The Nash Motors Co., Milwaukee; the International Harvester Co., Chicago, and the Samson Tractor Co., Janesville, Wis., all are making heavy purchases. Sales are frequent in Cleveland, but action is awaited on numerous smaller inquiries. The Hudson Motor Car Co., Detroit, issued a large list recently, said to aggregate $700,000 worth of machinery. Pittsburgh has been more or less affected by the steel and coal strikes which have brought about some contraction of machinery buying. However the Slick-Knox Co., Pittsburgh, bought grinders, stamping presses, drills, etc., in addition to three cranes for Wheatland, Pa. Further east, action is expected any minute on large lists issued by the General Electric Co., and the American Car & Foundry Co. The Otis Elevator Co. is buying equipment for Quincy, Ill., and Harrison, N. J. The Driver-Harris Co., Harrison, is figuring on some shop equipment and the Standard Oil Co. is making further purchases for Bayway, N. J.

Railroads are making entrances into the market from time to time for needed tools. The Santa Fe and Rock Island both bought in Chicago; the Chicago, Burlington & Quincy is gathering figures on a revived inquiry; the New York Central is asking Cleveland dealers for quotations; the Pennsylvania lines west wants cranes for Crestline, O., and Logansport, Ind.

Cranes continue to find takers, although few inquiries now are out. The Midvale Steel & Ordnance Co. closed on nine for Johnstown, Pa. The Superior Sheet Steel Co., Canton, O., ordered five. The Newton Machine Tool Works, Inc., Philadelphia, and the Aluminum Co. of America, Marysville, Tenn., each bought two. The Firestone Steel Products Co., Akron, O., has revised its inquiry to call for six overheads and two hand-operated cranes. Several steel companies and others each took one crane. A few small inquiries are current both in Pittsburgh and New York City. The Metal Hose & Tubing Co., Brooklyn, N. Y., has decided to purchase overhead cranes and no decision has been made by the Willys Corp., Elizabeth, N. J., regarding its electric crane program.

Recent Buying in Middle West Defers Deliveries

HEAVY buying which has prevailed throughout the Middle West for weeks past has affected materially the deliveries of machine tools in the East. Practically all of the larger manufacturers of this equipment are booked well ahead. They are offering planers at anywhere from two to five months, shapers at virtually the same delivery; boring mills at four to five months; lathes at eight to 12 weeks, and radial drills at two to three months. These deliveries, however, can be bettered by some of the smaller companies. Drilling machines, as a general proposition, can be had within three to four weeks. Shipments on turret lathes are also available for relatively early delivery.

In addition to the large volume of buying in the Middle West, the labor situation may be regarded as a factor in the present status of deliveries. Some shops have been affected by strikes, and in practically all cases, labor has not been up to the normal standard of efficiency. In a few instances, it is understood, forces were reduced early this year and since have not been increased.

Trading in the East during the past week has been light, although action on a couple of large lists now pending is being expected almost momentarily. The General Electric Co. and the American Car & Foundry Co. are referred to. The Otis Elevator Co. is buying machine tools for Quincy, Ill. The Driver-Harris Co., Harrison, N. J., is figuring on some hammer shop equipment. The Standard Oil Co. is buying further equipment for its Bayway, N. J. plant. The New York Air Brake Co. is planning not only to increase its production of motor trucks, recently undertaken, but also take up the manufacture of passenger cars. Another eastern concern to enter this field shortly is the Du Pont Motor Mfg. Co., now building a plant at Wilmington, Del. The machine tool requirements have not as yet been issued.

Branch Offices:

Chicago **Cambridge, Mass.** **Detroit** **Buffalo** **New York City**
Cincinnati **Cleveland** **Philadelphia** **Pittsburgh**

rifle plant, Eddystone, Pa., are now being auctioned off by the Philadelphia district salvage board of the ordnance department. Half of the machines are from the Fox Gun Co., Philadelphia, and the Bethelehem Loading Co., New Castle, Del. It is understood that the majority of the machines have been used.

Activity in the crane market again is being confined principally to actual buying; but few new inquiries are coming out. The largest purchase recently was that of the Midvale Steel & Ordnance Co., involving four 10-ton overhead cranes, one 75-ton ladle crane, and two 75-ton trolleys and two 25-ton trolleys for its Johnstown, Pa. plant. The contract went to the Alliance Machine Co., Alliance, O. Another sizable order, reported in the East, called for four 10-ton and one 35-ton overhead crane for the Superior Sheet Steel Co., Canton, O., the business going to the Morgan Engineering Co., Alliance, O. The Newton Machine Tool Works, Inc., Philadelphia, placed two 15-ton overhead cranes with the Pawling & Harnischfeger Co., Milwaukee.

The Staten Island Shipbuilding Co. bought a 5-ton Milwaukee overhead crane, with 47-foot span, for a plate shop. The Corrugated Bar Co., Buffalo, ordered a 5-ton double trolley overhead crane, with 47-foot span, from the Champion Engineering Co. The Donner Steel Co., Buffalo, recently bought a 5-ton electric crane, with 37-foot span, from the Niles-Bement-Pond Co. Smidth-Lewis Foundry, Inc., 50 Church street, New York City, is to close shortly on a 10-ton electric crane. The Otis Elevator Co., Eleventh avenue and Twenty-sixth street, New York City, also is expected to close soon on a 5-ton electric crane with 50-foot span, for Quincy, Ill., and a 5-ton electric crane, with a 48-foot span, for Harrison, N. J.

The Metal Hose & Tubing Co., 253 Tillary street, Brooklyn, N. Y., is considering the installation of an overhead crane in a new plant to be erected in that city. It has been definitely decided to install overhead conveying equipment of some description. The Willys Corp., which is to spend approximately $4,000,000 on plant construction at Elizabeth, N. J., has not decided what action will be taken with regard to electric cranes.

Market Though Inactive is Strong

ALTHOUGH wanting in activity, the market for machine tools in the Pittsburgh district, shows no lack of strength. Indeed, it is getting to be an almost daily occurrence for the trade to receive notice of price advances in one line or another. A Cincinnati maker of wood-working machinery recently announced a 25 per cent increase, which carries the lists of this company back to the war levels. Frequent advances in the past few months have carried many makes of lathes, drills and heavy grinders above their war prices and it is doubtful if any of these lines now can be bought for less than the prices which prevailed at this time last year.

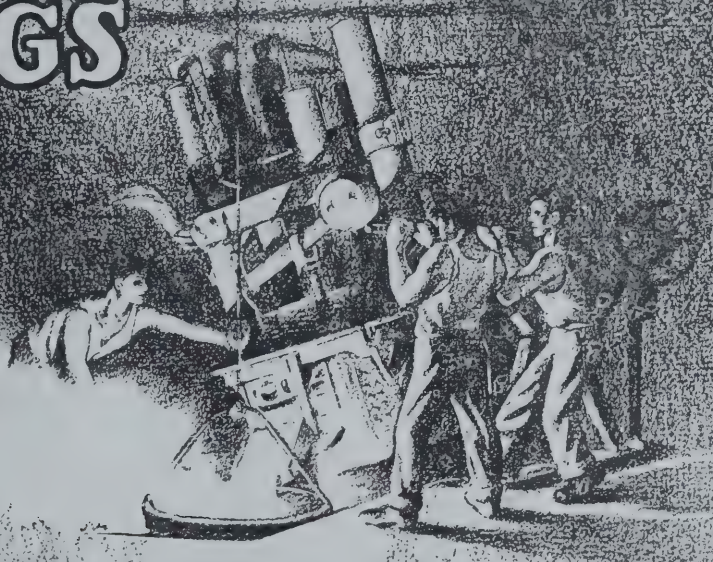
Although the steel and coal strikes have brought about a considerable contraction in buying, this development has not helped the makers in the matter of deliveries, eight weeks now being the shortest date promised even on the smaller tools. An Ohio maker of heavy steel-plant equipment recently announced a horizontal increase of about 20 per cent, due to the necessity of increasing wages to keep its working organization intact. As intimated in THE IRON TRADE REVIEW of Nov. 6, the Alliance Machine Co., Alliance, O., was the successful bidder for the cranes for the Cambria works of the Midvale Steel & Ordnance Co., at Johnstown, Pa. The Aluminum Co. of America, has placed an order for two 20-ton cranes for its new plant at Marysville, Tenn., with the Morgan Engineering Co., Alliance, O., in addition to the six ordered from this company several weeks ago. The Slick-Knox Co., Pittsburgh, has placed three overhead cranes with the Northern Engineering works, Detroit, Mich. These cranes are for its Wheatland, Pa. works, for which grinders, stamping presses and drills also have been purchased.

Live inquiries for cranes include a monorail for the American Window Glass Co., Pittsburgh; a crane and bridge for the McConway & Torley Co., Pittsburgh; a 15-ton crane for the Cincinnati Shaper Co., Cincinnati; a 20-ton crane with 5-ton auxiliary for the Weirton Steel Co., Weirton, W. Va.; a 10-ton, 38-foot span crane for the Marietta Mfg. Co., Mt. Pleasant, W. Va., while the Pennsylvania railroad, lines west, is looking for a 10-ton monorail for its Crestline, O. works and a 10-ton, 70½-foot span crane for its shops at Logansport, Ind. The Firestone Steel Products Co., Akron, O., has revised its original crane inquiry and now seeks bids on six overhead and two hand-operated cranes, all of the same span.

Several Large Sales Made in Chicago

SELLING of machine tools by Chicago dealers is going forward at a heavy rate with some large buyers now entering the market to add their purchases to the great volume which comes in small lots from scattered sources. One dealer finds his total sales for October higher than any other month but one since he entered business. November is bringing sales at a rate which promises to make it the largest in his experience.

The Nash Motors Co. has placed orders for about $60,000 worth of tools for its Milwaukee plant, most of them being for the tool room. Delivery is asked between Dec. 1 and Dec. 15. The International Harvester Co. is seeking further equipment for its tractor plant. The Samson Tractor Co., Janesville, Wis., continues to buy equipment from week to week, and one order to a single seller called for $160,000 worth of gear cutters. The Santa Fe railroad and the Rock Island railroad have bought a few tools, and the Chicago, Burlington & Quincy railroad is gathering figures on its revived list.



The Western Electric Co., Chicago, is starting construction on three additional buildings, and probably will be in the market shortly for equipment. The E. H. Wachs Co., Chicago, is building an addition to double its capacity for producing steam engines. A manufacturer of tools and dies who has just obtained a location, placed orders for his equipment recently. Milling machines are difficult to obtain and deliveries now range about four months.

Canadian Dealers Report Brisk Business

INQUIRIES for machine tools and equipment continue to be a feature of the Canadian machinery market, and dealers state that business is brisk. G. E. Reckin, Wiarton, Ont., is in the market for equipment for a furniture factory including double tenoning machine, band resaw, dovetail machine, two spindle horizontal boring machine, vertical boring machine, etc. F. Hogan, 337 Van Norman street, Port Arthur, Ont., is in the market for a small circular saw mill, 50 to 75-horsepower, all complete. The Aero Cushion Inner Tube Co., Wingham, Ont., will spend $20,000 on new machinery for the manufacture of casings, etc. The Thornbury Electric Lighting Co., Thornbury, Ont., will require equipment for the plant it will erect to replace the one damaged by fire. Gilbert Plains, Man., and the Provincial government of Manitoba, will erect an electric plant at Gilbert Plains and are requesting prices on machinery and equipment. The Bishopric Wall Board Co., has appointed W. E. Noffke, Central Cham-

MEMBER OF

Say you saw it in THE IRON TRADE REVIEW

bers, Elgin street, architect for the erection of a plant at Ottawa, Ont., to cost $100,000, and is receiving prices on steel and machinery for the plant. The Dominion Coal Co., Glace Bay, N. S., is making improvements to its coal properties costing $200,000 and will also construct a bunk head to cost $50,000. J. W. Revere, purchasing agent of the company is in the market for compressor fans, hoisting engines, haulage engines, pumps, air pipe and other machinery.

Individual Inquiries Small, Bulk Large in Aggregate

WITH orders fairly frequent, Cleveland machinery and machine tool dealers state that it keeps them busy answering the numerous inquiries which come in from scattered sources. These inquiries are not particularly large but represent a steady demand that gives stability to the business. Practically no effects of the coal strike are noted; the chief difficulty facing dealers is the inability of manufacturers to make anything but long time deliveries.

From Detroit come additional reports of activities among the automobile manufacturers. A sizable list is expected soon from the Hackett Motor Car Co., Grand Rapids, Mich., which has increased its capital to $1,000,000 for the purpose of increasing production to 7500 cars annually. The Chevrolet Motor Co., Bay City, Mich., is filling extensive equipment needs but the largest transactions current are the purchases of the Hudson Motor Car Co., and the Essex Motor Car Co., Detroit, said to aggregate $700,000 for a machine shop which is to commence operations on Jan. 1, 1920. The Detroit Gear & Machine Co., Detroit, is refinancing to permit of new additions and the installation of equipment. An adding machine plant at Grand Rapids, Mich., for the American Can Co., will take much equipment, including many automatics, since it is to be four stories high. Milton A. Holmes is directing sizable machinery purchases for the Transport Truck Co., Mt. Pleasant, Mich. Details are lacking regarding the expansion plans of the Shaw Electric Crane Works, Muskegon, Mich., but several buildings are to be erected and it is thought, some machine tools will be purchased.

Only small inquiries are current in Cleveland. The Columbus Wire & Fence Co., Columbus, O., wants one milling machine, one lathe and three variable speed motors. The Forest City Machine & Forge Co., Cleveland, incorporated recently for $830,000 by Alonzo M. Snyder, Williamson building, has issued an inquiry for some equipment. It is understood to have closed on two multiple spindle drills. It is reported that the Collamer Machine Works, 1214 East 152nd street, Cleveland, also has closed on its requirements. The Adams Axle Co., Findlay, O., is in the market for a 2-spindle centering machine. The National Safe & Lock Co., Cleveland, is seeking a No. 4 type H condensation return pump. The Garford Laboratory, 131 Forest street, Oberlin, O., is asking for one new Amex bench lathe with fixtures. The Slick-Knox Steel Co., Pittsburgh, wants a used No. 59 Toledo press with 12-inch stroke and 3 x 32-inch bolster plate. The Klein Iron Works, Bellevue, O., wants a used 10-ton electric crane with 75-foot span. The Titan Steel Products Co., Cleveland, wants a ½-inch nut tap A few railroad inquiries continue to come out and one of the tools recently asked for by the New York Central railroad is a 2-inch bolt cutter.

The Bryan Pattern & Machine Co., Bryan, O., already has ordered tools to replace those damaged by fire Nov. 2. Milling machines, drills, etc., will probably be asked for soon by the More-Miles Manifold Co., just located in Warren, O., to manufacture a manifold invented by Edgar Gree, president of the company. Among other equipment, several automatics will probably have to be purchased by the Victor Typewriter Co., Scranton, Pa., when its 3-story addition to triple the plant output is further along. For the purpose of expanding and adding to its equipment, the Klein Iron Works, Bellevue, O., has increased its capital to $150,000. An addition to the plant of the Racine-Sattley Co., Springfield, Ill., together with equipment, yet to be purchased, will cost $850,000.

Building operations in several localities promise additional inquiries soon. These include an addition for the Lycoming Foundry & Machine Co., Williamsport, Pa.; 2-story addition for the Randall Machinery Co., Cincinnati; improvements to factory of the Frontier Machine & Tool Co., Buffalo; 1-story machine shop, 50 x 336 feet, for the American Locomotive Co. plant at Chester, Pa.; and an addition for the Stevens Metal Products Co., Niles, O.

Construction and Equipment

Concise and Timely Business Building Opportunities from the Field of Industry

Among New England Plants

PORTLAND, ME.—The A. J. Waterman Mfg. Co. has been incorporated to build machinery with $200,000 capital by E. V. Mann, M. D. Mills and Charles D. Booth.

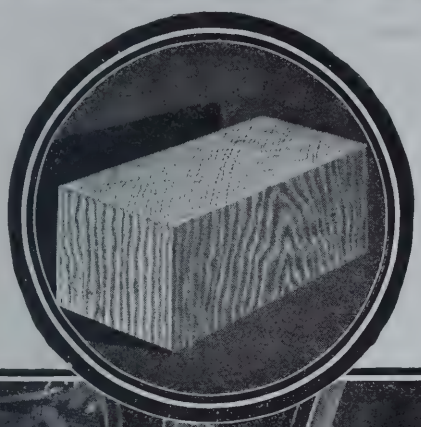
FRANKLIN, N. H.—The Seawell Needle Co. will move its plant from Tilton, N. H., to this city.

TROY, N. H.—The Troy Blanket Mills has let the contract for a 4-story, 68 x 284-foot mill, a 2-story, 64 x 225-foot picker house, a 1-story, 50 x 50-foot boiler house and a 1-story, 4 x 47-foot addition to the present boiler house to cost $300,000.

RUTLAND, VT.—The Rutland Railway, Light & Power Co. has started work on a hydroelectric power plant, to cost $500,000.

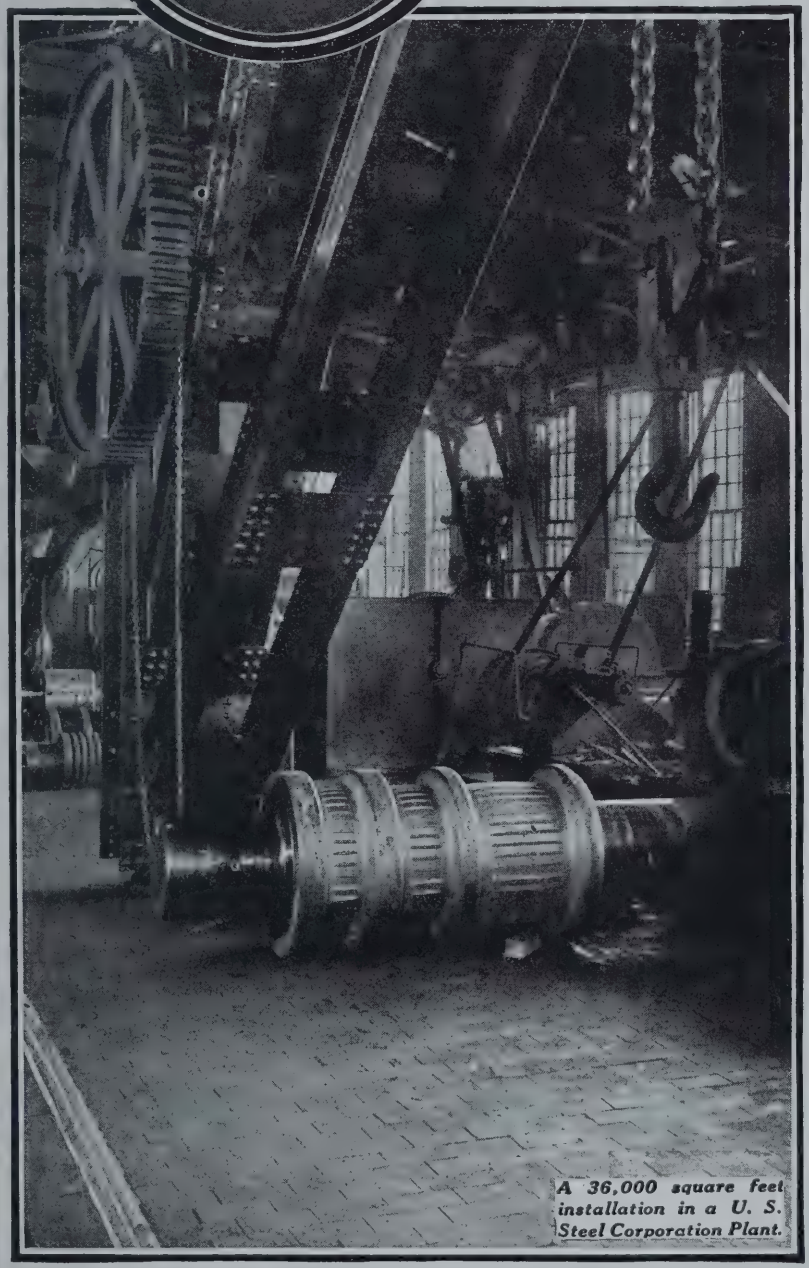
BOSTON.—The Rivett Lathe & Grinder Co. has let the contract for a 3-story, 60 x 200-foot factory to cost $100,000.

BOSTON.—The New England Telephone & Telegraph Co. has let the contract for a 3-story, 66 x 100 x 185 building to cost $700,000.



BOSTON.—The Dover Foundry & Mfg. Co. has awarded a contract for a warehouse and garage, 4-stories, 60 x 90 feet, to cost $47,000.

BOSTON.—The Mary E. Moore Mfg. Co. has been incorporated to make articles of steel with $25,000 capital by Mary E. Moore, A. C. Perry and E. P. Clough.



BOSTON.—The Associated Mills Supplies, Ltd., has been incorporated to deal in metals, etc., with $10,000 capital by James Chesney, Maurice Whalen, Everett, Mass., and Walter A. Hall.

CAMBRIDGE, MASS.—The Riverside Boiler Works has let the contract for a 1-story, 79 x 82-foot galvanizing building.

CAMBRIDGE, MASS.—The addition to the plant of the F. S. Paine Co., elevator manufacturer, is

Kreodone EVERLASTING Wood Block Floors

A 36,000 square feet installation in a U. S. Steel Corporation Plant.

Wear Like Steel

THERE are 36,000 square feet of our incomparable wood block floor in this U. S. Steel Corporation plant in Cleveland, Ohio—for the reason that only our selected long-leaf yellow pine blocks, treated with our special pure creosote oil will stand the "gaff"—the wear and tear of trying service. This floor is now over 10 years old.

They wear like steel, are cool in summer and warm in winter. They are not affected by water, oil, grease, or dilute acids.

They are restful to the feet—no slippage, no unevenness. They make every move count and never fail to increase output.

In more than 20 years of pioneering experience in wood block floors we have solved the secret of the perfect factory floor—and the benefit is yours. We have the material and special construction if necessary for your plant.

Write us. Let our engineers give you the information you desire about the universally used KREODONE wood block floors.

Our illustrated catalog is now ready. A postal will bring it. Write today.

nearing completion and machinery will be installed soon.

CHICOPEE, MASS.—The Fisk Rubber Co. has let the contract for a 1-story and basement, 23 x 115-foot factory addition and a 23 x 40-foot power plant addition.

HOLYOKE, MASS.—The National Blank Book Co. has let the contract for a 2-story, 100 x 200-foot machine shop to cost $75,000.

HOLYOKE, MASS.—The George W. Prentiss Co. maker of wire, has let the contract for a 2-story, 60 x 100-foot warehouse to cost $60,000.

LACONIA, MASS.—Scott & Williams, 265 Union street, has awarded a contract for a boiler house, to cost $20,000.

MIDDLEBORO, MASS.—The Lobl Mfg. Co. has been incorporated to make cutlery with $250,000 capital by Frederick Lobl, Fred L. Bowman and Simon C. Pilshaw.

SOUTH WEYMOUTH, MASS.—The Gale-Sawyer Co., tool maker, is making extensive additions and alterations.

WORCESTER, MASS.—The O. & J. Machine Co. has been organized here to manufacture metal patterns. business.

WORCESTER, MASS.—The Modelyacht Co. has been incorporated to make metal goods, with $10,000 capital, by Henry H. Forbes, Linwood M. Erskine and Floyd A. Ramsdell.

WORCESTER, MASS.—The Ionite Storage Battery Co. has been incorporated to make storage batteries by a new process with $100,000 capital by Albert H. Williams, John L. Judkins, Rayworth W. Burnham and Howard W. Cowee.

PAWTUCKET, R. I.—The Rhode Island Malleable Iron Works has let the contract for an addition.

PAWTUCKET, R. I.—The Potter & Johnstone Machine Co. will build a 2-story, 63 x 72-foot foundry addition and will alter buildings Nos. 1 and 2 at a cost of $60,000.

PROVIDENCE, R. I.—The Aetna Automatic Oil Burner, Inc., has been incorporated to make oil burners with $1,000,000 capital by John Scheminger Jr., Charles F. Scheminger and George B. Peckham.

WARREN, R. I.—The Cap-Swivel-Let Co. has been incorporated to make electrical goods with $50,000 capital by Leonard P. Bosworth and Albert L. Bosworth, both of Barrington, R. I., and Frederick I. Johnson.

BRIDGEPORT, CONN.—The Bridgeport Hardware Mfg. Co. contemplates a plant addition to cost $10,000.

ELMWOOD, CONN.—The New Departure Mfg. Co., Bristol, Conn., has let the contract for a 2-story, with basement and sub-basement factory.

NEW BRITAIN, CONN.—Landers, Frary & Clark will build a 96 x 289-foot building to cost $200,000 and a 3-story, 40 x 68-foot tempering building.

NEW BRITAIN, CONN.—Plans are being drawn for a 1-story, 32 x 360-foot with a 40 x 60-foot ell addition to the New Britain Machine Co. to cost $40,000.

NEW BRITAIN, CONN.—The Hart & Hutchinson Mfg. Co., maker of steel lockers, has let the contract for a 1-story, 76 x 337-foot with a 30 x 67-foot wing factory to cost $30,000.

NEW HAVEN, CONN.—The Howard Engineering Co., Inc., has been incorporated with $50,000 capital, by Jacob Weinstein, E. A. Weinstein and Daniel Weinstein.

NEWINGTON, CONN.—The Hartford Tube Products Co., Hartford, Conn., has let the contract for a 1-story, 50 x 120-foot factory and a 1-story, 30 x 30-foot office building.

THOMASTON, CONN.—The Plume & Atwood Mfg. Co. will build a 30 x 60-foot addition to its brass mill.

TORRINGTON, CONN.—The Torrington Mfg. Co. has awarded a contract for a $10,000 plant addition, 60 x 180 feet, two stories high.

WATERBURY, CONN.—The Lux Clock Co. has let the contract for a 2-story, 30 x 54-foot addition.

WATERBURY, CONN.—The Oakville Co., wire and metal goods, has let a contract for a power house.

WATERBURY, CONN.—The American Chain Co. plans a 2 and 4-story, 128 x 100-foot factory to cost $135,000.

WATERBURY, CONN.—The Holaday, Telford Co. has been incorporated to deal in metal patterns with $10,000 capital by A. E. Holaday, Joseph Telford and W. S. Brakenridge.

WEST HAVEN, CONN.—Approximately $650,000 will be expended by the Kelly Tire & Rubber Co. on a building, 100 x 300 feet, and the necessary equipment.

Government Inquiries

BIDS on the following equipment are desired by the navy department, bureau of supplies and accounts.

Miscellaneous self-supporting pillar cranes, 4884, Brooklyn.
One bench lathe, Philadelphia, 4801.
One steam towing machine, 4885, Puget Sound.
One pipe cutting and threading machine, 4897, Washington.
Miscellaneous hoisting electric cranes, 4938, Brooklyn; miscellaneous hoisting and rotating equipment, 4938, Norfolk and Mare Island.
Three plate-punching tables, 4949, Mare Island.
Miscellaneous portable electric drills, electric bench grinders, 4968, various eastern and western yards.
Eleven vertical boring mills, 4990, Washington.
One traveling head slotter, 4991, Washington.
One motor-driven shaping machine, 4994, Washington.

Schedule numbers, dates of opening and places of delivery follow the specifications of the tools.

North Atlantic States

BROOKLYN, N. Y.—A $75,000 plant will be erected by the Metal Hose & Tubing Co., 253 Tillory street. Plans call for a 3-story structure, 80 x 100 feet.

BUFFALO.—The Clipper Tool Co., 38 A street, has had plans prepared for a 2-story addition, 20 x 60 feet.

BUFFALO.—The Jewell Steel & Malleable Co., 373 Hertel avenue, is having plans prepared for an addition.

BUFFALO.—The North Buffalo Hardware Foundry Co., 743 Hertel avenue, has had plans drawn for a foundry, 32 x 60 feet.

ELLIOT, N. Y.—The Chatauqua Electric Car Mfg. Co. has been incorporated with $750,000 capital, by E. A. Peterson, A. N. Broadhead and E. C. Nord.

MIDDLEPORT, N. Y.—The Niagara Spray Co. has had plans drawn for a machine shop, power house and chemical building.

MORRIS, N. Y.—The Linn Tractor Corp. has been incorporated with $50,000 capital, by G. Whitman, H. H. Linn and R. R. Ripley.

NEW YORK.—The Pioneer Metal Goods Corp. has been incorporated with $250,000 capital, by J. Hamber, P. Wurtz and W. M. Messersmith, 25 Broad street.

NEW YORK.—The Monarch Lamp Mfg. Co. has been incorporated with $10,000 capital, by L. Edelman, S. Gross and S. D. Schindler, 238 South Third street.

NEW YORK.—The Mutli-Angle Drill Corp. recently was incorporated with $500,000 capital, by G. S. Vangelder, R. M. Stillman and F. H. Prindle, 15 Broad street.

NEW YORK.—The Kobert Machine Co., Inc., recently was incorporated with $125,000 capital, by G. W. Wylie, W. P. Barker and M. B. Donahue, 27 William street.

NEW YORK.—William Vanderkoogh & Co., Inc., steel scrap, has been incorporated with $15,000 capital, by E. E. Fingarr, A. H. Holbrook and J. Macknight, Wood Haven.

NEW YORK.—The Continental Body Corp., auto and aircraft bodies, recently was incorporated with $25,000 capital, by N. W. Dalton, J. M. Sheehan and H. R. Frost, 52 Broadway.

NEW YORK.—The Mergenthaler Linotype has awarded a contract for a plant, 8-stories, 70 x 300 feet, to cost $600,000.

NEW YORK.—The Tiphany Motor Co. has been incorporated with $400,000 capital, by W. C. Dodge, F. U. Horowitz and L. M. Crumbacher, 1451 Broadway, and will manufacture electric motors and machine equipment.

NEW YORK.—Bishop, Friedman & Bergstrom have been incorporated with $20,000 active capital to manufacture metal alloys, by P. Corning, O. E. Friedman and V. E. Berkstrom, 30 Church street.

NEW YORK.—The Automatic Expansion Co. has been incorporated with $50,000 capital, by E. Kuebler, F. Roeger and L. Bach, 541 East Forty-eighth street, to engage in the manufacture of metal products.

OGDENSBURG, N. Y.—The Morgan Chemical Corp. has been incorporated with $250,000 capital, by A. O. Morgan, H. O. Meredith and W. S. Moore.

ROCHESTER, N. Y.—The Rochester Motors Co., Inc., has let a contract for a 1-story machine shop addition, 100 x 390 feet.

ROCHESTER, N. Y.—The Atlantic Stamping Co. has had plans drawn for an addition, 2-stories, 69 x 201 feet, to cost $75,000.

ROCHESTER, N. Y.—The Josiah Anstice Co., Inc., North Water street, has awarded a contract for a foundry, 145 x 216 feet, to cost $70,000.

SCHENECTADY, N. Y.—The General Electric Co. has awarded contracts for a brass foundry, 100 x 100 feet, to cost $30,000.

SYRACUSE, N. Y.—The Roberts Tool & Supply Co., Inc., has been incorporated with $60,000 capital, by F. A. and J. F. Roberts and F. J. Lynch.

CORNWELLS, PA.—The plant of the Traylor Shipbuilding Corp. is to be converted for the manufacture of motor trucks.

EAST STROUDSBURG, PA.—The Pocono Metal Mfg. Co. has been incorporated with $50,000 capital, by G. C. Gruenthal, Louis Rupprecht and L. A. Kohl.

HARRISBURG, PA.—Charles A. Fair, 128 Sylvan terrace, will build a 2-story machine shop and auto repair works, 70 x 120 feet, at an estimated cost of $20,000.

MAHONOY CITY, PA.—The Mahonoy City Foundry & Machine Works recently was incorporated with $25,000 capital, by L. Garfinkel, M. J. Ryan and S. Fogel.

NANTICOKE, PA.—The Buplan Silk Co., 50 Union Square, has awarded a contract for a boiler house, 2-stories, 90 x 100 feet.

PHILADELPHIA.—A $50,000 boiler house will be erected here by the American Preserve Co.

PHILADELPHIA.—Max Haupt, 1713 Samson street, has plans for a 1-story forge shop addition.

PHILADELPHIA.—Schaum & Uhlinger, Inc., Glenwood and North American avenues, manufacturer of

textile machinery, has plans for an extension to its machine shop to cost $15,000.

PHILADELPHIA.—The Brown Instrument Co. has acquired a factory building adjoining its plant.

PHILADELPHIA.—The Luster Machinery Co., Widener building, has leased property here for a local establishment.

PHILADELPHIA.—The Wicaco Screw & Machine Works, Seventh and Wood streets, is drawing plans for a plant, to cost $100,000.

PHILADELPHIA.—The Wright Mfg. Co., 131 Master street, has plans for a 1-story addition, 16 x 90 feet, to cost $17,000.

PHILADELPHIA.—Frank C. J. Dursch, 848 East Woodlawn street, has plans for a 2-story plant, 53 x 65 feet, to cost $13,000.

PHILADELPHIA.—The Bessemer Motor Truck Co. has purchased 16½ acres. Plans for improving the property have not been announced.

PHILADELPHIA.—The A. S. Ashman & Son Co., 2300 East Tioga street, contemplates a forge shop addition, 1-story, 20 x 32 feet.

PHILADELPHIA.—The Drain Steel Co. has been incorporated with $10,000 capital, by J. S. Shepherd, 1420 Chestnut street, John A. Drain, 405 Elm avenue, Swarthmore, Pa., and others.

PHILADELPHIA.—The Globe Machine Co., Kinsey and Josephine streets, has had plans prepared for a 1-story machine shop addition, 12 x 54 feet.

CAMDEN, N. J.—The Concrete Steel Co. contemplates a manufacturing building, 1-story, 26 x 144 feet, to cost $10,000.

ELIZABETH, N. J.—The general contract for factory buildings has been awarded by the Willis Corp. to Warren, Moore & Co. The buildings will be one and two stories. Equipment as yet has not been inquired for.

HARRISON, N. J.—The Crucible Steel Co., South Fourth street, plans a 1-story boiler house.

HARRISON, N. J.—The Harrison Bolt & Nut Co. has been organized to operate a plant for the manufacture of bolts, nuts, etc., by S. F. Laucks and others.

HARRISON, N. J.—The general contract for an addition to the plant of the Driver-Harris Co., manufacturer of wire products, has been awarded to E. M. Waldron, Newark, N. J. The addition will comprise two factory buildings, one a 3-story structure, 50 x 100 feet, to be used for wire working and the other, a 1-story structure, 60 x 200 feet, to serve as an extension to the hammer department.

HOBOKEN, N. J.—The Tidewater Iron Works, 731 Jefferson street, has had plans prepared for a 1-story addition.

HOBOKEN, N. J.—The Button Machinery Co., 1023 Clinton street, has awarded a contract for a plant and boiler house, to cost $170,000.

JERSEY CITY, N. J.—The White Metal Mfg. Co. has been incorporated with $500,000 capital to manufacture containers. Theodore Rurode, T. H. Smith and D. F. Edwards, all of Jersey, are interested.

MASURY, PA.—The Standard Steel Car Co. is reported planning plant additions.

NEWARK, N. J.—The Circle Stamping & Mfg. Co., 763 Broad street, has been incorporated with $100,000 capital.

NEWARK, N. J.—The Industrial Tool Works, Inc., 10 Railroad place, has been incorporated with $25,000 capital.

NEWARK, N. J.—The Accurate Screw Machine Co., 128 Mulberry street, has been organized by V. S. Buckson and others.

NEWARK, N. J.—The Star Cutlery Co., 75 Livingston street, has been incorporated to manufacture cutlery, metal goods, etc., with $50,000 capital.

NEWARK, N. J.—The International Motor Co. has taken a long term lease on the greater portion of a building to be erected here by George W. Baney. The company will use part of the building for machine shop and forge work.

NEWARK, N. J.—Approximately $300,000 will be expended by the Duratex Co. on a plant addition. The main building will be 1-story, 100 x 500 feet, and will be used for the manufacture of rubber goods. Another building, to be used for storage purposes will be 60 x 200 feet. Other structures include a building 40 x 75 feet and addition to the power house, 60 x 75 feet. The company plans to spend approximately $200,000 on equipment.

PLAINFIELD, N. J.—The Modern Machine & Tool Co. has been incorporated with $25,000 capital to manufacture tools, etc. The incorporators are Frank Cozzoli, Joseph Luchesi and Joseph Mutnick, all of Plainfield, N. J.

TRENTON, N. J.—A $20,000 power plant will be erected by the Trenton Malleable Iron Co.

TRENTON, N. J.—Fitzgibbon & Crisp, Inc., Calhoun street, will erect an addition to their auto and carriage manufacturing plant to cost $15,000.

TRENTON, N. J.—The Trenton Tool Co. has been incorporated with a capital stock of $25,000 to manufacture foundry tools and machinery. The incorporators are Harvey T. Satterthwaite, Marian H. Atkinson and Sara A. Satterthwaite.

BALTIMORE.—The American Train Control Corp. has been chartered with $2,000,000 capital to manufacture an automatic train control system, by C. W. Hendrick, 1337 Mt. Royal avenue, T. R. Thomas and R. L. Williams.

Belgians Buy Tools

ANNOUNCEMENT is made by R. D. Robinson, secretary of the army salvage board at Cincinnati, that the Belgian government has placed an order for more than 2200 machine tools to cost about $5,000,000. According to Mr. Robinson, many machine tools to fill the order already have been shipped from that city. "The importance of this sale to the Belgian government," declared Mr. Robinson, "will be of material advantage to the American machine tool manufacturers in foreign markets."

Central States Activity

APPLETON, WIS.—The Langstadt & Meyer Co., 767 College avenue, will build a 2-story shop, 55 x 150 feet, with a wing, 48 x 67 feet, to be equipped for general electric manufacturing purposes.

BARABOO, WIS.—C. H. Grubb, manufacturer of barn equipment, will build a forge shop and a factory addition, 40 x 120 feet.

BEAVER DAM, WIS.—The Western Malleable Co. is converting its Center street foundry for manufacturing light and small work. The building is being remodeled, the annealing room is being enlarged and the pattern shop will undergo extensive changes to meet the changed requirements.

DE PERE, WIS.—The Toonen-Barlamant-Wright Co. will spend $25,000 for the construction and equipment of an addition to its public garage, repair shop and farm machinery service building.

KENOSHA, WIS.—The International Earth Boring Machine Co., 10 South La Salle street, Chicago, will build a 1-story factory, 150 x 300 feet.

MILWAUKEE.—The Atlas Foundry Co. is taking bids for a core room, 1-story, 80 x 80 feet.

MILWAUKEE.—The Globe Electric Co., Inc., 193 Broadway, Milwaukee, with a capital stock of $200,000, has been reincorporated as the Globe Electric Co.

MILWAUKEE.—The American Radiator Co. is establishing a service shop and warehouse at 1801-1807 St. Paul avenue, 2-stories, 84 x 175 feet, and cost about $45,000.

MILWAUKEE.—Articles of incorporation have been filed by the Duplex Storage Battery Co. The capital stock is $60,000. A. J. Model and Thomas J. Mahon, attorney, appear as incorporators.

MILWAUKEE.—The Universal Aniline Dyes & Chemical Co., 137 Michigan street, is having plans prepared for the first unit of its plant at South Milwaukee, to be 2-stories, 50 x 150 feet, costing $150,000 with equipment. M. H. Wiltzius is president.

MILWAUKEE.—The A. O. Smith Corp. will start work about Nov. 20 on the second section of its new plant extension project. Work on the first unit is under way and will provide a 1-story shop, 175 x 740 feet. The second section will measure 360 x 850 feet.

MILWAUKEE.—The Cadillac Motor Car Co., Detroit, has selected Milwaukee as the site of one of a series of branch assembling plants. An initial expenditure of $250,000 is planned at Milwaukee. A site has been purchased and plans for a 3-story building, 121 x 250 feet are being prepared.

RHINELANDER, WIS.—The Rhinelander Light & Power Co. will make a 20 per cent increase in its generating capacity by installing new water wheels and dynamo equipment.

BAY CITY, MICH.—The Union Motor Truck Co. is having plans drawn for a 1-story power plant.

BAY CITY, MICH.—The Valley Auto Specialty Mfg. Co. has been incorporated with $50,000 capital, by Allan McEwan and others to manufacture auto parts, etc.

DETROIT.—Work has started on a foundry for the Packard Motor Car Co.

DETROIT.—The Liberty Motor Co. will build a $60,000 administration building.

DETROIT.—The Steel Products Co. is taking bids for a plant addition, 1-story, 32 x 60 feet.

DETROIT.—The Timken Detachable Axle Co. will erect a boiler house at an estimated cost of $25,000.

DETROIT.—The Detroit Gear & Machine Co. plans plant additions and the installation of new equipment.

DETROIT.—The National Forging Co. has been incorporated with $25,000 capital, by W. N. Coyer, 345 Hamilton avenue, and others.

DETROIT.—Kauffman & Co. recently was chartered with $10,000 capital to manufacture tools, by E. A. Kauffman, 405 Chene street, and others.

DETROIT.—The Wood Hydraulic Hoist & Body Co. has awarded a contract for a machine shop and storage building addition, 1-story, 50 x 240 feet, to cost $40,000.

DETROIT.—The Nevison-Reed Body Co. has been incorporated with $40,000 capital by William E. Reed, 384 Twelfth street, and others, to manufacture sheet metal auto bodies.

DETROIT.—The Hare Stoker & Furnace Co. has been chartered with $75,000 capital, by H. M. Lane, 208 Highland avenue, and others, to manufacture boiler room equipment.

DETROIT.—The Commonwealth Heat Treating Co. has been incorporated with $10,000 capital, by J. W. Petrie, 656 Virginia Park avenue and others, to engage in the heat treatment of steel.

DETROIT.—The Michigan Patent Peel Co. has been incorporated with $25,000 capital, by John L. Crandall, 845 Jefferson avenue, and others, to engage

in the manufacture of baking machinery and tools.

GRAND RAPIDS, MICH.—The American Can Co. is constructing a plant here the main building of which will be 4-stories, 66 x 286 feet.

KALAMAZOO, MICH.—The Herrbold-Keenan Co. has been chartered with $200,000 capital to manufacture machinery, by W. A. Herrbold and others.

LANSING, MICH.—The Bean Spray Pump Co. has awarded a contract for a plant addition, 1-story, 40 x 80 feet, to cost $25,000.

MT. CLEMENS, MICH.—The Reynolds Motor Truck Co. has been incorporated with $200,000 capital, by L. C. Wolff and others. Plans have been prepared for the erection of a plant.

MUSKEGON, MICH.—The Shaw Electric Crane Co. contemplates an addition to double its capacity.

MUSKEGON, MICH.—The Carlson Rotary Engine Co. has been incorporated with $10,000 capital, by T. A. Carlson and others, to engage in the manufacture of gas engines.

OWOSSO, MICH.—The Field Mfg. Co. is completing an automobile body plant addition.

CHAMPAIGN, ILL.—W. E. C. Clifford and D. B. Jacobs will operate a drop forge plant under the name of the Clifford-Jacobs Forging Co. The company will make a specialty of automobile hubs, connecting rods and other auto parts.

CHICAGO.—Montgomery, Ward & Co. are erecting an addition to their plant at Springfield, Ill.

CHICAGO.—The Crane Co., 836 South Michigan avenue, contemplates a machine shop and warehouse.

CHICAGO.—The C. A. Roberts Co., 228 North Jefferson street, steel tubing, contemplates a 1-story plant.

CHICAGO.—The Pettibone Mullikin Co., 140 South Dearborn street, will start work soon on a foundry, 154 x 243 feet, to cost $200,000.

CHICAGO.—The George W. Pyott Co., manufacturer of power transmission equipment, 1401 West North avenue, has purchased a site on which it plans to erect a plant.

DECATUR, ILL.—The H. Mueller Mfg. Co. is taking bids for a machine shop, 1-story, 156 x 200 feet, to cost $16,000.

HAVANA, ILL.—The E. J. List Co. has been incorporated with $35,000 capital to manufacture friction clutches, by E. J. and A. B. List and F. C. Eusteneur.

PEORIA, ILL.—The Twin City Steel & Machinery Co., Minneapolis, with a branch in this city, recently was incorporated in this state with $100,000 capital.

ROCKFORD, ILL.—The Mechanics Machine Co. contemplates a plant addition.

BETHAVEN, IND.—The McBeth Evans Glass Co. has awarded contracts for machine and pattern shop additions, 2-stories, 50 x 110 feet, to cost $40,000.

EVANSVILLE, IND.—The Advance Stove Works is having plans drawn for a plant addition, 2-stories, 30 x 50 feet.

EVANSVILLE, IND.—The Vulcan Implement Factories has been incorporated with $300,000 capital, by Richard Rosecrans, J. H. Berryhill and G. A. Trimble.

EVANSVILLE, IND.—The American Mfg. Co. has been incorporated with $100,000 capital, by George Tugwell, Leonard Hartman and Oscar Stahl. The company will manufacture spark plugs.

FT. WAYNE, IND.—The Tokheim Oil Tank Shop has awarded contracts for a tank shop, 1-story, 85 x 197 feet, to cost $150,000.

INDIANAPOLIS.—The Holcomb & Hoke Mfg. Co. contemplates an addition, 3-stories, 68 x 128 feet.

INDIANAPOLIS.—The H. A. Brown Mfg. Co. has been incorporated with $200,000 capital, by H. A. Brown and others.

INDIANAPOLIS.—The National Automatic Wireless Baler Co. has been incorporated with $100,000 capital, by B. T. Brown, A. D. Porter and R. M. Coleman.

INDIANAPOLIS.—The Brownlee Mfg. Co. has been incorporated with $100,000 capital, to manufacture machinery, by D. T. Brownlee, James H. Deakin and Merritt F. Blizard.

INDIANAPOLIS.—The H. C. S. Motor Car Co. recently was incorporated with $1,000,000 capital to manufacture motor cars, by H. C. Stutz, H. F. Campbell, Samuel T. Murdock and Henry H. Hornbrook.

KOKOMO, IND.—The Walton & Macke Nail Co., Inc., recently was incorporated with $100,000 capital, by A. G. Rundle, O. H. Skinner and George D. Armstrong.

RICHMOND, IND.—The National Automatic Tool Co. has placed contracts for a plant addition.

RICHMOND, IND.—The Richmond Piston Ring Co. recently was incorporated with $300,000 capital to manufacture iron and metal products. The directors are Richard A. Booker, William R. Dill, George H. Eggemeyer, W. C. Hibbered and Frederick G. White.

SULLIVAN, IND.—The Mutual Truck Co. is having plans drawn for a plant addition, 1-story, 100 x 300 feet, to cost $40,000.

VINCENNES, IND.—The Indiana Power Co. has been incorporated with $5,000,000 capital, by C. E. Gregg and others.

CANTON, O.—The Union Metal Mfg. Co. is erecting a building to be devoted to the manufacture of foundry equipment.

CINCINNATI.—The Ohio Butterine Co. is having plans drawn for a boiler and engine room, 1-story, 20 x 86 feet.

CLEVELAND.—The Auto Screw Products Co. has let a contract for a 1-story building, 89 x 140 feet.

CLEVELAND.—The Republic Brass Co., 4607 Payne avenue, has awarded contracts for a plant, 2-stories, 66 x 200 feet, to cost $100,000.

CLEVELAND.—The Pneumatic Appliance Co. has been incorporated with $25,000 capital, by T. J. Moffett, B. F. Evarts, Albert H. Manchester and others.

CLEVELAND.—W. H. Smith, care of Ernest McGeorge, 1900 Euclid avenue, is having plans prepared for a machine shop and foundry, 100 x 120 feet to cost $75,000.

CLEVELAND.—The Schenck Electrical Appliance Co. recently was incorporated with $10,000 capital, by Edward J. Shernoy, William H. Chapman and others.

CLEVELAND.—The Super Steel Co. recently was incorporated with $100,000 capital, by Louis Bloomfield, E. P. Chamberlain, F. M. Kemp, Engineers building, and others.

CLEVELAND.—The Cleveland Mixer & Mfg. Co. has been incorporated with $10,000 capital, by John P. Dempsey, John J. Sturgess, G. Henderson, Garfield building, and others.

COLUMBUS, O.—The Simplicity Wheel Columbus Co. has been incorporated with $15,000 capital, by George F. Burwell, Robert C. Byers, Louis M. Greenstein and others.

COLUMBUS, O.—The Safety Wire Gas Globe Co. has leased a building at 44 East Chestnut street, which will be equipped for the manufacture of safety wire gas globes.

CUYAHOGA FALLS, O.—The Superior Mold & Equipment Co. recently was incorporated with $50,000 capital, by A. G. Hachtel, S. J. Taylor and others.

DAYTON, O.—The Nichols Electric Co. has been incorporated with $30,000 capital, by John K. Meyers, G. D. Carver and others.

FINDLAY, O.—The Buckeye Traction Ditcher Co. is reported planning an addition to its foundry at a cost of $75,000.

OBERLIN, O.—This city contemplates an electric power plant.

TOLEDO, O.—The Automotive Corp., 644 Spitzer building, is taking bids for an assembling building, 1-story, 90 x 300 feet, to cost $40,000.

WARREN, O.—The Youngstown Sheet & Tube Co. is taking bids for several buildings.

PARKERSBURG, W. VA.—The Parkersburg Rig & Reel Co. has awarded contracts for a foundry, to cost $110,000.

Business in Canada

ELMWOOD, MAN.—The Elmwood Machine Works, 405 Nairn avenue, has started work on an addition to its plant to cost $20,000.

ST. BONIFACE, MAN.—The Canadian Car Wheel & Foundries Co., Montreal, Que., will start work at once on a plant here to cost $60,000.

WINNIPEG, MAN.—The American Grain Separator Co. (Canada), Ltd., has been incorporated to manufacture grain separating machinery, with $50,000 capital, by Robert J. Owens, John L. Owens both of Minneapolis; Charles S. Brown and Matthew R. Elden both of Winnipeg, and others.

CALGARY, ALTA.—The Liquid Air Co., First street east and second avenue, has let the general contract for a plant to cost $30,000.

ST. JOHN, N. B.—The Dominion government recently appropriated $700,000 for the construction of the Courtnay Bay drydock here. The St. John Dry Dock & Shipbuilding Co. has the contract for the erection of the plant.

MONTREAL, QUE.—The Engravers Machinery Co., of Canada, Ltd., has been incorporated with $50,000 capital to manufacture machinery, steel dies, copper plates, etc., by Francois P. Brais, Albert W. Stuart, Laura M. Smith and others.

MERRICKVILLE, ONT.—The Percival Plow & Stove Co. will build an addition.

OTTAWA, ONT.—The Ottawa Car Co., Slater street, has let the general contract for a brass foundry to cost $25,000.

OTTAWA, ONT.—The Chemical & Engineering Co., Ltd., has been incorporated to manufacture hydraulic equipment, etc., with $50,000 capital, by Arthur Ellis, Redmond Code, Marie K. Herbert and others.

TORONTO, ONT.—The Northern Aluminum Co., Sterling road, will start work on a factory building to cost $358,000.

WALKERVILLE, ONT.—The Eclipse Machine Co., Ltd., has been incorporated with $100,000 capital, to manufacture machinery, etc., by Edward J. Dunn, James B. Rathbone, Alexander D. Falck and others all of Elmira, N. Y.

WHITBY, ONT.—The Nash Motor Co. proposes to establish a branch plant in Canada. A site of 60 acres has been selected as a likely spot for the plant.

WINDERMERE, ONT.—Thomas Clark will build an electric light and power plant here. He wants prices on the necessary equipment for the plant.

WINDSOR, ONT.—The Sanford Riley Stoker Co. of Canada, Ltd., has been incorporated with $100,000 capital, to manufacture machinery, etc., by Robert S. Riley, Fred H. Daniels both of Worcester, Mass.; Oscar E. Fleming, Windsor, Ont., and others.

WINDSOR, ONT.—The purchase of the properties owned by the Dominion Stamping Co. at Ford City, by the Ford Motor Co. of Canada, has been announced. The plant will be used for the manufacture of fenders, sheet metal and other automobile accessories. This deal does not involve the forging plant of the Dominion Stamping Co.

INDUSTRIAL ISLAND, B. C.—The Britannia Wire Rope Co., amalgamated with Gibsons, Ltd., Vancouver, B. C., will build a plant here for the manufacture of wire rope, etc.

General view of Reclaiming and Distributing Conveyor, and Mold Conveyors, in foundry of Kelsey Wheel Co., Detroit, Mich.

Increased Efficiency and Link-Belt Machinery

THE present-day foundry is vastly different from the average foundry of the past, due to the increasing use of modern methods to save labor and minimize the operating expense.

With everything else geared up for quantity production to reduce costs, and in view of the growing scarcity of labor, it becomes necessary to install elevating and conveying machinery for handling the sand, pig iron, coke, molds, castings, refuse, etc. in the foundry. Foundrymen in general are realizing with increasing certainty that machinery of this type, when properly designed and built, and well taken care of, is fully as necessary an adjunct, and as reliable and economical in operation, as any other foundry equipment, such as ladle cranes, blowers, etc.

The Link-Belt Company has had a most extensive experience in building mechanical handling equipment for foundries—its installations dating back to the early period of development of the elevating and conveying art.

We invite foundry operators, when planning new foundries, or making changes in old foundries, to avail themselves of our special engineering service, to insure that suitable provisions for the proper machinery are made. Write for Catalog No. 390.

New Trade Publications

MONEL METAL.—An illustrated booklet, published by the Monel Metal Products Corp., Bayonne, N. J., describes and illustrates monel metal, an alloy of copper, nickel and other metals. Various data pertaining to the metal are given, including tables of physical properties, tests, etc.

AIR COMPRESSORS.—Two bulletins have been issued by the Ingersoll-Rand Co., New York, calling attention to the use of air compressors. One bulletin is a cardboard folder and is devoted to air lift pumping of water. The second leaflet calls attention to two catalogs issued by the company, Nos. 3230 and 3131. The former describes belt driven compressors while the latter points out the details of the steam driven type.

SHAKING GRATE.—The Rose Patent Grate Co., Council Bluffs, Iowa, has published a 15-page booklet, in which a shaking grate for steam boilers is described and illustrated. This grate can be used for stationary, marine and locomotive work. According to the booklet it is constructed so that the fire bed is lifted bodily from the bottom allowing the ashes to fall through the grates to the pit below. Full data pertaining to the grate are given as well as a number of illustrations.

SAND BLAST.—The Pangborn Corp., Hagerstown, Md., is circulating an interesting booklet, containing illustrations of the company's executives, views of its offices and various departments of its plant as well as illustrations of sand blast and allied equipment which it manufactures. The booklet is printed on heavy coated stock and the pictures are mounted on a background of blue. A partial list of users of the equipment manufactured by the company is given on the back page of the booklet.

FOUNDRY SUPPLIES.—Small tools and supplies for foundry, factory and general mill use, are described and illustrated in a 62-page catalog recently published by the Liberty Supply Co., Philadelphia. Among the supplies described are chaplets, hinge tubes, stove door catches, foundry nails, wire nails, twisted steel gaggers, molders' bellows, brushes, brooms, rammers, mallets, goggles, general molders' tools, shovels, wheelbarrows, trucks, core-oven cars, etc. All articles are illustrated and specifications and other data are given.

ELECTRIC HEATERS.—Applications of electrical heat by means of standardized heaters are described in a 4-page folder published by the Cutler-Hammer Mfg. Co., Milwaukee. The heaters, which look like 2-foot rules, are 3/16 of an inch thick, 1½ inches wide and 24 inches long. All parts are enclosed in a steel jacket. A list of uses to which these heaters are adapted includes, heating, drying rooms, crane and hoist cabs, meter houses, and valve houses; drying rewound motor armatures, etc.; for heating platforms for table men and shear men in steel plants and for low temperature ovens.

CLAM-SHELL BUCKETS.—An illustrated folder is being circulated by the Blaw-Knox Co., Pittsburgh, in which single line clam-shell buckets are described and illustrated. These buckets are of riveted steel plate and parts are of annealed open-hearth steel castings and heavy steel forgings. Renewable bushings are provided and lubrication is provided for by means of compression plugs, grease being forced into the cavities machined in the pins and castings. These buckets are adapted to various kinds of work including, their use in power plants, foundries, steel mills, on railroad construction work, etc.

CENTRIFUGAL PUMP.—Design, theory and practical application of centrifugal pumps and the methods of testing employed in the plant of the Goulds Mfg. Co., Seneca Falls, N. Y., as well as descriptions of various types of these pumps, are treated in a 36-page booklet recently published by the Goulds company. The data in the bulletin was first issued in letter form for the use of the company's selling organization, but the booklet has been reprinted for general distribution. Much valuable data are given, and many illustrations show various parts of the pumps. A number of curves appearing in the booklet are interesting.

REFRACTORY BRICK.—A booklet of 16 pages has been published by the Harbison-Walker Refractories Co., Pittsburgh, in which refractory brick especially adapted for service in open-hearth and electric furnaces are described and illustrated. This brick was first placed on the market in 1916. The brick consist of round or square soft steel containers, open at the ends, and packed with ground dead-burned magnesite. According to the booklet they are especially adapted for service in the backwalls, bulkheads and ends of the basic open-hearth furnace, and the sidewalls of the electric furnace. Other data are given and the illustrations show the use of the brick.

OIL BURNERS.—The Hauck Mfg. Co., Brooklyn, N. Y., recently published an illustrated 16-page booklet in which various types of oil burners and furnaces are described. According to the booklet they are adapted particularly to use in foundries, firing cupolas, drying molds, heating and drying ladles, patching cores, melting brass; in boiler shops laying up corners, shaping throat sheet work, flanging, dishing, heating rivets, bending pipe, etc.; in machine and repair shops, preheating for welding, brazing, expanding to make shrink fits, melting soft metals, tool dressing, tempering and heating soldering irons. Various data pertaining to each type are given, as well as illustrations.

FACTORY TRUCKS.—The use of trucks for handling or storing materials in the process of manufacture is described and illustrated in a 24-page booklet recently issued by the Howe Chain Co., Muskegon, Mich. Each of these trucks consists of a platform, equipped with two malleable iron wheels at the rear and a malleable iron draw bar and leg in front. To move the truck a handle or tongue, mounted on a wheel, is attached to the draw bar by means of a lever action, which lifts the leg 1¼ inches from the floor, thus supporting the load on the two rear and one front wheels. Various types of bodies are provided for various work. The booklet contains a number of illustrations of these trucks in actual use. A list of users is given.

Opportunities Abroad

Requests for information should be forwarded to district or co-operative office in your district, of the Bureau of Foreign and Domestic Commerce. Each request should be on a separate sheet and be accompanied by the opportunity number

A commercial agent from Australia desires to purchase and secure agencies for the sale of hardware, electrical goods, tools, stoves, etc. Oportunity No. 31158.

An importer in Italy desires to purchase, or secure an agency, for lumber, automobiles, motorcycles, farm tractors and agricultural implements. Correspondence should be in Italian. Opportunity No. 31159.

Representation is desired by a man in Turkey of manufacturers and exporters of nails, hardware, iron and brass bedsteads, etc. Opportunity No. 31160.

A firm in Italy desires to purchase and secure an agency for the sale of metal casters, locks for furniture. Correspondence should be in Italian or French. Opportunity No. 31162.

A trading company in England desires to secure agencies for the sale of bolts and nuts, iron and brass screws, wire nails, horseshoe nails, wire netting, hinges, bar and sheet iron and other products. Opportunity No. 31164.

A company in England desires to purchase electrical fittings and appliances, steel-enameled conduits for electrical wires, and teak blocks for mounting switches. Opportunity No. 31166.

Representation is desired by a man in France for the sale of nails, steel tubing, wire, etc. Correspondence may be in English. Opportunity No. 31167.

A company in Spain operating four shipways, desires to get into communication with exporters of ship plates and angles. Correspondence should be in Spanish. Opportunity No. 31171.

A firm in France desires an agency from manufacturers of machine tools, such as lathes, planing machines, drilling machines of radial type, woodworking machinery and portable belt conveyors. Opportunity No. 31174.

A company in India desires to secure agencies and purchase clipless paper-fastening machines, paper fastener clips, collar buttons, sleeve links, small hand machines for making wicks, taps, embroidery, etc. Opportunity No. 31177.

The representative in the United States of a firm in Italy desires to make connections with agricultural machinery manufacturers with a view to securing an agency for pumps, tractors, harrows, plows, seeding machines, engines, windmills, harvesting machines, hay presses, dairy machinery, etc. Opportunity No. 31181.

A merchant in Argentina desires to purchase iron in bars, woods, construction materials, copper wire, hardware in general, etc. Opportunity No. 31183.

A commercial agent in Colombia desires an agency for the sale of agricultural implements and machinery. Opportunity No. 31185.

The general purchasing agent of a firm in Spain desires to purchase and secure an agency of iron-piping installations, with faucets, valves, connections, etc.; belting for power transmissions, electrical measuring instruments, electrical equipment of all kinds and motors. Correspondence should be in Spanish. Opportunity No. 31190.

A commercial agent in Belgium desires an agency for the sale of all kinds of articles connected with heating installations, such as boilers, radiators, taps, ventilators, pumps, turbines, motors, hydrometers, thermometers, regulators, tools, etc. Correspondence may be in English. Opportunity No. 31191.

THE IRON TRADE REVIEW

Vol. LXV Cleveland, November 20, 1919 *No. 21*

More Production Greatly Needed

Pressure From Overdue Tonnage Upon the Mills is Severe—Prices Generally Incline Higher But Leading Maker Offers 1920 Sheet and Tin Plate at Unchanged Schedule—Pig Iron Less Feverish

REDOUBLED efforts to increase iron and steel production are resulting from the mounting pressure for supplies under which the mills and furnaces now are laboring. Output is steadily growing but it still is considerably below the prestrike volumes and little yet has been accomplished in overcoming the shortage of material. This lack of tonnage remains the dictating influence in shaping price and sales policies. In fact there continues small disposition to sell in any line in view of the heavy obligations. With large railroad requirements for steel now coming into view for release with the return to private control, the problem of supply has become more acute. In various products the tonnage now available and that expected through to July are being prorated with great care.

More tonnage has been added to the virtual reservations for rails for 1920 delivery which the mills are making for various roads awaiting the latter's return to their former ownership. This has applied both to roads in the Chicago district and in the East. Contracts have been all but formally closed for a large tonnage.

Steel Prices Are Strong

Restraint continues to be exerted by influential producing interests against higher prices for steel but this is only partially successful. The American Sheet & Tin Plate Co. has opened its books for first half contracts for sheets and tin plate at the same prices previously which represent the basis established by the industrial board March 21. Independent mills are inclined to follow suit, though occasional sales by them of prompt sheets are being made at large premiums. Wire products are commanding higher prices readily. An eastern mill has sold a round tonnage of plates at 2.75c and has taken some orders at 2.85c. Pittsburgh bar iron makers have made another advance of $3 per ton. Semifinished material is very strong. Wire rods have been sold at $60 to $65. Sheet bar sales above $45 are reported. Scrap is stronger and higher. Buffalo reports inquiries for 100,000 tons of heavy steel.

Iron is Less Feverish

Buying of pig iron is less excited and spot metal is not so actively sought but the market is extremely strong with a higher tendency. Foundry iron is steadier around $32 furnace for the base grade in valley, lake and Chicago territory. At Buffalo and in eastern Pennsylvania it is at $34 with No. 2X at $35 to $35.25. A southern maker sold 25,000 tons for next year in the Chicago district on the basis of $31 base. Heavy tonnages previously booked by lake and western Pennsylvania furnaces subject to prices to be determined later, now have been written into contracts at the $32 base. Most producers are reluctant to book further and much tonnage is seeking a seller. Automobile interests at Detroit want fully 100,000 tons including 40,000 to 50,000 tons for the Ford Motor Co. The General Motors Corp. has partially filled its inquiry for 22,000 tons. Basic has advanced to $30 valley and bessemer to $31.50 valley. There is a growing shortage of basic in the central west. After sizable sales last week up to $33 furnace, 25,000 tons of eastern basic were closed at $31 to $32 delivered.

Output Cut By Coal

While reduced production of coal has had little effect upon the iron and steel industry in this country, the fuel shortage is the dominating factor in the situation in Great Britain and Europe, according to special cable advices to THE IRON TRADE REVIEW. British pig iron production as a result is down to 575,000 tons monthly compared with an average of 625,000 tons for the year to date, 755,000 tons in 1918 and 855,000 tons in 1913. British steel output however is keeping ahead of the 1913 rate because of the wartime extensions. Germany is producing pig iron at present at the rate of 516,000 tons monthly as against 1,600,000 tons before the war. The situation in France is the worst of all and many furnaces have been forced down. Under these conditions export competition from these countries is limtied and some of them, England especially, continue to seek material freely on this side.

Building on Solid Ground

HOW to prevent speculation in iron and steel products at a time when production is artificially curtailed by the reduced forces of employes is a problem to which the more substantial producers are giving serious consideration. The demand for steel products is so insistent that consumers willingly and anxiously offer premiums to the mills for early deliveries. This is the situation which is most discernible in the export trade. Business men know that premiums eventually have their effect upon prices. If the speculators were permitted absolute freedom of action the situation undoubtedly would become worse and prices would go soaring.

The severest critics of the American market are the foreign purchasers of steel. It is acknowledged that supplies have been curtailed and that foreign consumers are unable to purchase certain lines here for any amount of money. But foreign purchasers likewise recognize that the American mills have demonstrated a willingness to serve legitimate customers fairly and well. Reputable American mills have refused to sell to speculators but have accepted orders, whenever it was possible to do so, from legitimate consumers. They have attempted to supply only those who are in the greatest actual need of supplies of steel.

Foreigners have been prone to criticise American industries as being too anxious to chase the dollar. They are beginning to realize that a different doctrine has been and is being inculcated. It is the doctrine of established reputation and continued business relations. That is the only doctrine which will foster a permanent foreign trade.

Transportation Board Needed

WHILE it has become almost a pastime of congress to create unnecessary boards, commissions, etc., upon the slightest provocation, there are circumstances frequently which justify fully the establishment of new governmental bodies of this character. This is true in the case of the proposed transportation board provided for in the senate railroad bill. As stated by the senate committee on interstate commerce, this marks the first real recognition of co-ordination of water and land transportation, which should be brought about.

The board would perform functions now exercised by the interstate commerce commission, such as the administration of the car service act, of the safety appliance acts, of the hours of service act, of the locomotive boiler inspection act, and others. It also would be charged with a number of important duties relating to water transportation, chiefly by way of investigations that should lead to important results, and would be given control over the issuance of railroad securities. Section 45, an entirely new regulation, is intended to increase American export and coastwise trade, making it easier for the interior shipper to avail himself of the ocean routes, and would be administered by the board.

The entire country must know that the interstate commerce commission is greatly overworked, and is utterly unable to keep up with the demands made upon it. Yet its duties would be increased tremendously by the railroad bills unless some other body should be created to assume these new burdens or the commission should be enlarged and divided, which at best, would represent a doubtful expedient. Some new arm of the government's transportation service, therefore should be created to take over these new responsibilities and to relieve the commission of some which it now has to assume.

Smelting Titanium-Bearing Ore

ON ACCOUNT of the large deposits of titanium-bearing iron ore yet unmined in this country, the possibility of its use in the blast furnace is a problem furnace managers, no doubt, will be compelled to face in the future. Many furnacemen hold that ores analyzing over 1 per cent titanium are

detrimental to furnace operation, inasmuch as the ratio of coke per ton of metal is extremely high as compared with the practice when lake ores are used; and furthermore, that the furnace hearths are built up by the formation of infusible compounds. These beliefs evidently are founded on hearsay rather than on actual observation, because in the early days, when charcoal practice was in vogue, the percentage of titanium in the ores did not seem to worry the ironmasters to any great extent.

Experiments carried out in 1914 at a Port Henry, N. Y., blast furnace working on 25 per cent of an ore containing 13 per cent titanium, tend to throw a different light on what actually can be done with ores of this nature. Further experiments with titaniferous iron sands of New Zealand, a paper upon the subject of which appears elsewhere in this issue, also tend to offset whatever disfavor may be held in connection with titanium ore smelting.

The concensus of opinion of those in direct charge of the recent experiments is that titaniferous ores can be smelted in the blast furnace with no greater expenditure of heat than that required for nontitaniferous magnetites, and, since a larger volume of oxygen is removed by the action of carbon monoxide than is the case with nontitaniferous ores, a lower coke consumption per ton of iron may be expected. With the exhaustion of lake district ores, low in phosphorous, looming up in the future, many ironmasters eventually may be compelled to operate their furnaces on titanium-bearing ores, the analysis of which as a rule shows a comparatively low phosphorus content. For this reason, it is fortunate that research for solving the problem of smelting these ores is being conducted and is making progress.

Railroads Preparing to Buy

ALL of the railroad companies are formulating plans in anticipation of the return of the roads to their owners. Several have put out inquiries for large tonnages of rails for 1920, it being stipulated that the orders, if placed, may be cancelled if the railroad administration retains control. Some steel companies have refused to quote on this basis, while others are said to have taken orders subject to an understanding.

A great deal of tonnage is needed which neither has been placed nor inquired for. For instance, the Erie railroad needs 20,000 to 30,000 tons of rails which under ordinary circumstances it would lay in January, February and March. Many other roads need rails, and in addition they need large tonnages of steel for bridges, buildings and other purposes. If the roads are returned to their owners, the orders will be placed. If the control remains with the railroad administration, it is apparent that the latter will be required to place orders for at least a portion of the requirements.

Despite the absence of railroad buying, the steel industry has been choked with orders and some of the smaller steelmakers now are considering a policy of putting up prices to discourage buyers.

Because costs are low with relation to present selling prices and because some mills now are selling with practically no profit, there is some curiosity as to how long the steel industry as a whole would be able to resist the temptation to raise prices generally in the event that a freshet from railroad sources swelled the great stream of orders.

Light of Sanity Breaking

A REDEEMING feature of the strike situation in this country is to be found in the more frequent expressions of sanity and clear thinking on the part of labor itself. The loud-mouthed and radical minority has had the stage but as its leadership has proved so costly to the cause of labor, measured in terms of public opinion, the more sober counsel and influence among wage earners in different industrial centers gradually is being heard and heeded. The radical element has overstepped itself and a break among the workers is perhaps the most hopeful sign in the present period of unrest. In New England, the labor element has in many cases swung around to side against the extremists of its own class.

A recent action of the New England Foundrymen's association also shows the attitude of the vast majority of the people. This association sent the following resolution to the governor:

"The membership in the New England Foundrymen's association represents over 200 of the foundries throughout New England. To a great extent the members have risen from the ranks of those who have labored with their hands to the directorship of these particular industries. They appreciate that law and order must be maintained, and that in their enforcement, the commonwealth cannot allow itself to be embarrassed, nor the law questioned by groups of individuals, whoever they may be or whatever interest they represent. The members of the association unanimously voted at the regular meeting to express to you their very statesman-like stand in connection with the controversy with the Boston police force."

Roger W. Babson, in a recent talk before the American Gear Manufacturers' association, expressed his belief that manifestly unjust strikes such as the Boston police strike, and others, form an important step in the general progress toward a better understanding between labor and capital. The coal strike is playing its part in this awakening and will help to bring about sane and equitable conditions in industry not only for employer and employed, but for the general public as well.

Iron and Steel Prices

Corrected to Wednesday Noon

SCRAP, WAREHOUSE, ORE AND OTHER PRICES ON PAGES 1420 AND 1422

Pig Iron

Bessemer, valley	$31.50
Bessemer, Pittsburgh	32.90
Basic, valley	30 00
Basic, Pittsburgh	31.40
Basic, delivered, eastern Pa.	31.00 to 32.00
Malleable, Pittsburgh	32.50
Malleable, Chicago, furnace	32.50
Malleable, Buffalo, furnace	35.25
Malleable, delivered eastern Pa.	36.00 to 37.00

FOUNDRY IRON SILICONS

No. 2 Northern	1.75 to 2.25
No. 2 Southern foundry	1.75 to 2.25
No. 2X Eastern and Virginia	2.25 to 2.75
No. 1X Eastern	2.75 and up
No. 1 Chicago	2.25 to 2.75
No. 2 foundry Eastern	1.75 to 2.25

No. 1X, eastern delivered Phila.	$37.10 to 37.60
No. 1X, Buffalo	37.00
No. 1 foundry, Chicago furnace	33.25
No. 2 foundry, valley, Pittsburgh	33.40
No 2 foundry, Buffalo	34.00
No. 2 Northern, Boston	34.90 to 35.90
No. 2 foundry, Chicago furnace	32.00
No. 2 foundry, Ironton furnace	32.75
No. 2 foundry, Cleveland furnace	32.00
No. 2X, eastern del., Phila.	36.10
No. 2X, eastern, N. J. tidewater	36.10
No. 2X, eastern, Boston	35.90
No. 2X foundry, Buffalo furnace	35.25
No. 2 foundry, del., Philadelphia	35.10
No. 2 foundry, N. J. tidewater	35.10
No. 2 southern, Birmingham	30.00 to 31. 0
No. 2 southern, Cincinnati	33.60
No. 2 southern, Chicago	35.00
No. 2 southern, Phila.	36.50
No. 2 southern, Cleveland	35.00
No. 2 southern, Boston	38.00
No. 2 southern, St. Louis	34.25
Virginia, No. 2X, furnace	33.25 to 34.25
Virginia, No. 2X, Philadelphia	37.35 to 38.35
Virginia, No. 2X, Jersey City	37.65 to 38.65
Virginia, No. 2X, Boston	37.95 to 38.95
Gray forge, valley, Pittsburgh	32.40
Gray forge, Buffalo	32.00 to 33.00
Gray forge, eastern Pa.	31.50
Silveries, 8% furnace	45.25 to 47.25
Ohio Silveries, 8%, Chicago	46.80
Tennessee Silveries 8% Chicago	48 65
Low phos. standard, Phila.	43.50 to44.00
Low phos. Lebanon, furnace	36.00 to 37.00
Low phos. standard, Pittsburgh	41.40
Charcoal, Superior, Chicago	35.50 to 38.00
Charcoal, Superior, Chicago first quarter 1920	35.50 to 37.50

Coke

(At the ovens)

Connellsville furnace	$5.75 to 6.25
Connellsville foundry	6.50 to 7.50

Pig Iron Less Excited But Strong

Valley Basic Sells at $30 Furnace But Eastern Basic After Reaching $33 Furnace Subsides to $31 and $32 Delivered—Northern Foundry From $32 to $34 and Southern at $31—Detroit Interests Seek 100,000 Tons

Pittsburgh, Nov. 18.—The feature of the pig iron market the past week has been the sharp advance in steel-making iron, which puts the latter in line with other grades. A lot of 2500 tons of basic was sold at $30, valley, for December shipment to a Cleveland furnace interest, while 1000 tons of standard bessemer for first quarter recently were sold to a Pittsburgh steel foundry at $31.50, valley. Producers now are not considering bids of less, for while the demand from Pittsburgh steel manufacturers is anything but brisk at present, the supply of both grades, particularly basic, is extremely scarce. This condition in part is explained by the fact that at hand-filled furnaces the supply of labor still is inadequate. The scarcity of standard basic iron is intensified by the fact that stocks recently were largely cleaned up, and also by the fact that several merchant producers who ordinarily make basic, now are running on other grades. The N. & G. Taylor Co. is reported to have covered on 3600 tons for the first quarter but verification is lacking. This company reported having had a price of $30.45, delivered, Cumberland, Md. The United Alloy Steel Corp., Canton, O., wants 10,000 tons of basic for December and the first quarter. The Westinghouse Electric & Mfg. Co. has covered for the remainder of this year and first quarter for its Cleveland foundry. A western Pennsylvania maker having taken 5700 tons at $33.25 for 2.25 to 2.75 silicon iron, $32 for 1.75 to 2.25 silicon and $31.50 for 1.25 to 1.75 silicon. A sale of 500 tons of No. 2 foundry for first half to a Pittsburgh district consumer is noted at $32, furnace. Meanwhile, spot foundry sales are numerous, generally around $34, furnace. Sales of malleable include 2500 tons at $31.50, valley, for this year and the early part of next year, while 300 tons for early delivery went at $32, valley furnace, and several carload lots at $33. A Pittsburgh district maker of bar iron recently closed on 6000 tons of gray forge for first half at $31, furnace, while between 2000 and 3000 tons of low phosphorus have been taken by a valley producer for first quarter at $40 furnace. Demand for silvery iron has continued heavy. The Ohio interest which recently increased to $45.25 for 8 per cent has made a further advance of $2 to $47.25. Sales at the higher price are reported to be quite as heavy as they were at the old figure. Only two merchant stacks in the Shenango valley now are idle, these being Stewart and No. 3 Shenango. The Carnegie Steel Co. now has 44 of its 59 stacks active, a gain of two stacks in the week. This company expects to start its furnaces at Mingo and Bellaire, O., soon.

Demand for Spot Iron Lets Up

Boston, Nov. 17.—The peak in spot pig iron buying here due to the combined effect of the steel strike and the coal strike has passed, and the last few days have seen spot iron turned down at $37 delivered for 2.25 to 2.75 silicon. First half iron remains firm, with prices in some districts advancing and with ready purchasers for almost any reasonable quantity offered. The Thomas Iron Co. has been making heavy sales throughout New England, evidently with the intention of obtaining a backlog for its first half operation. The prices from this producer during the first part of last week were below those generally offered from other sources but an announced advance taking effect from Nov. 15 establishes $34, $35.25 and $37 as the prices for 1.75 to 2.25, 2.25 to 2.75, 2.75 to 3.25 silicon iron, at the furnace, eastern Pennsylvania. Sales of Buffalo iron for first half delivery, during the week establish a market in that district at $34 at the furnace for base. Virginia furnaces have only limited amounts to offer, one furnace offering nothing but special analysis iron for spot shipment at fancy prices. The weeks sales in New England have been heavy due largely to the Thomas Iron Co. activity. The General Fire Extinguisher Co., Providence, R. I., bought 1000 tons of eastern Pennsylvania iron at $33.25 at the furnace for 2X eastern (2.25 to 2.75 silicon). A Connecticut consumer bought 800 tons of malleable from an Ohio furnace at approximately the market price for 2X (2.25 to 2.75 silicon). An order was placed for 2000 tons of Buffalo iron (2.75 to 3.25 silicon) at a price of $38 at the furnace. Small sales accepted by one of the southern furnaces for New England delivery were at $32 for 1.75 to 2.25 silicon iron at the furnace.

Much 1920 Business Closed

New York, Nov. 17.—While pig iron is even scarcer than it was, demand is less insistent, since consumers generally have been taken care of for this year. Orders placed here during the past week appear larger than surface indications show. One eastern Pennsylvania furnace during the past week booked fully 15,000 tons for first half delivery, in the New York and Philadelphia dis-

tricts. Some of this business was entered on outstanding quotations. Included in the business placed in this district during the past week were 1000 tons of foundry for first half to a Chicago district plant. Some Virginia, 1.75 to 2.25 silicon foundry for this year was sold here during the week at $32, furnace. High silicon iron is scarce and high. One eastern Pennsylvania maker has sold 2.75 to 3.25 silicon foundry during the week at $36.50 furnace. Bessemer iron is scarce. One lot for this year was sold at $34, eastern Pennsylvania furnace. For valley bessemer, $32 to $32.50, furnace, or $36.40 to $36.90, delivered in the east, is asked. A round lot of eastern Pennsylvania malleable was sold at $36.25, furnace, equivalent to about $37.25 delivered in eastern Pennsylvania. Ohio malleable was sold here at $35.25 furnace, equivalent to $40, delivered eastern Pennsylvania. A lot of 500 tons of valley malleable also was sold at $32 valley, equivalent to $36.40, delivered eastern Pennsylvania, and 1000 tons of western malleable for next year was placed, the price to be established later. A spot lot of 1000 tons of basic was sold in this district at $30, eastern Pennsylvania furnace, but this figure could not be duplicated. Makers of copper-bearing low phosphorus are observing approximately the following schedule: $36, furnace, on iron containing copper up to 1 per cent; silicon, 1 to 2 per cent, and sulphur and phosphorus, up to 0.04 per cent; $37, furnace, on copper up to 0.50 per cent; $38, furnace, on copper up to 0.25 per cent, and $39, furnace, where the copper is not over 0.04 per cent.

Some eastern Pennsylvania foundry for this year has been sold at $37, furnace, for 2.25 to 2.75 silicon and $38, furnace, for 2.75 to 3.25 silicon.

Shortage Reported at Buffalo

Buffalo, Nov. 18.—A shortage of iron is developing in this district. Many melters are hastening to be covered, but are encountering difficulty in getting iron for prompt shipment, only limited tonnages being sold in this territory. Melters are paying $34 for No. 2 foundry (1.75-2.25 silicon), $35.25 for No. 2X (2.25 to 2.75 silicon) and $37 for No. 1X (2.75 to 3.25 silicon). pound of iron in this district under the schedule. Some melters are going outside the district, and paying the freight. Canadian furnaces are selling considerable iron for delivery on this side.

Motor Interests Want Tonnage

Cleveland, Nov. 18.—Leading automolibe and accessory interests in the Detroit district have been in the market for probably 100,000 tons of foundry and malleable grades for first half and are meeting with difficulty in getting the furnaces to acept business in this amount. The Ford Motor Co. is in the market for 40,000 to 50,000 tons. The General Motors Corp. which sought 22,000 tons for Flint has bought partially against this requirement. A Detroit maker of automobile engine castings is out for 14,000 tons. In addition, there are various miscellaneous inquiries from plants identified with the automobile industry. One of these latter lots calls for 3000 tons of malleable and foundry. While the demand for spot iron is less feverish and the market consequently is steadier, much further tonnage was converted into orders the past week. This has been done mainly by interests which previously had taken tonnage from various regular consumers but had left the prices open for later determination. One producer in this territory with a large tonnage, accepted under these circumstances, settled upon a price of $32, furnace, for the base grade of 1.75 to 2.25 silicon, with the usual differentials for other grades. Local buyers have been enabled to place some further tonnage for first half on the basis of $32 for 1.75 to 2.25 silicon. At present however, most sellers are out of the market and are not inclined to take business at any price. A large producer was a buyer of 2500 tons of basic for November-December at $30 valley to apply against a contract for this grade and is seeking 3500 tons more. Another inquiry for 1000 tons of basic for this year is current. Some leading northern Ohio consumers of basic are likely to be buyers in the open market soon. A sale of 2000 tons of November-December malleable to an outside point at $31.50, valley, is noted, as well as 2600 tons of the same grade for first half at $32.50, western Pennsylvania furnace. A small sale of 1.75 to 2.25 silicon foundry for spot delivery at $34 valley, was made. Some speculative iron of the same grade is offered at $46 and $37, valley, but there are no sales at these levels. Some southern Ohio now is up to $34, furnace, for the base grade. B furnace at Toledo has gone out and the A stack there which has been undergoing rebuilding for seven months has gone in. The Struthers furnace has resumed.

Scarcity Reported at Cincinnati

Cincinnati, Nov. 17.—Malleable iron seems to be pretty well cleaned up in southern Ohio, but one late sale is reported around $35, furnace, for this year's shipment. No prices for future delivery are obtainable. Spot foundry iron is very hard to obtain both in the South and in the Ironton district. However, one selling interest took some additional business last week at $31, Birmingham, for No. 2 foundry, 1.75 to 2.25 silicon.

Expect Higher Prices at St. Louis

St. Louis, Nov. 15.—Pig iron continues active, all classes of consumers making strenuous efforts to acquire tonnages. More furnace interests have withdrawn from the market. A large tonnage has been sold in this district, and orders for 5000 tons were rejected, as were inquiries for iron for 1920. Prices are strong, with an advancing tendency. Spot iron of all grades and descriptions is extremely scarce, and brokers with small lots to dispose of are getting almost any price they care to ask. A feature in the situation is the return to this market of melters to the West and Northwest, who have not purchased here for several years.

Southern Iron Again Advances

Birmingham, Ala., Nov. 18.—Pig iron prices in the South have again advanced, $1 per ton, and are now on a basis of $31 for No. 2 foundry (1.75 to 2.25 silicon). Inquiries are numerous, but producers are still cautious. Reluctance to sell is caused by expectations of wage readjustments which may affect costs.

Alabama bessemer ferrosilicon now is held on the basis of $47 furnace from 9 to 10 per cent, $49.50 for 10 to 11 per cent, $52 for 11 to 12 per cent and $54.50 for 12 to 13 per cent.

Market is Less Excited

Philadelphia, Nov. 18.—Wildness of the pig iron market is reflected by fact that whereas 12,000 tons of basic for the first half were sold the week before last at $33 eastern Pennsylvania furnace, sales have been made the past week for first quarter at a delivered price of between $31 and $32. Of 25,000 tons of first quarter basic sold past week 15,000 tons brought this level and it is believed the remaining 10,000 brought the same figures. This business is only one indication of the fact that the upward tendency in eastern prices was less sensational the past week than in preceding weeks. Foundry sellers who advanced to $36 eastern Pennsylvania furnace for No. 2X (2.25 to 2.75 silicon) for next year report no business as yet at this figure. On the other hand, sellers report consumers now are showing less disposition to fall over themselves to cover for next year on the basis of $35 for No. 2X (2.25 to 2.75 silicon). Outside of the basic sales, the most important business was 10,000 tons of standard low phosphorus for first half sold on the basis of $43.50 to $44 delivered this district for 0.03 phosphorus. Although no copper-bearing low phosphorus iron has been sold, sellers have several thousand tons of inquiry for next year and the minimum they are quoting is $37 furnace. Malleable has been bought in East all way from $36 to $40 delivered. Highest price is being paid for valley malleable although some valley malleable sold in East at $32 valley or $36.40 delivered. No gray forge has been sold. One eastern maker quoted $36 furnace. Some eastern Pennsylvania foundry iron for spot shipment has been sold at $37 furnace for No. 2X and $38 for No. 1X (2.75 to 3.25 silicon) these figures are exceptional and market for this year still represented by $35 for No. 2X central Pennsylvania iron which was held at $35.50 furnace for No. 2X a week ago can be had at $35. Virginia foundry iron is higher. While No. 2 plain (1.75 to 2.25 silicon) has been sold at $32 furnace and possibly still is obtainable at this figure, No. 2X has been bought at $34.25 and No. 1X at $36 for this year. An unusual development is a sale during the past week of a large tonnage of eastern Pennsylvania foundry for shipment through the first half to a large Chicago district user. Another unusual incident is the offering here of Canadian inquiry for malleable. Export inquiries are out here for 22,000 tons of basic and 10,000 tons of foundry.

Chicago Market Nearly Bare

Chicago, Nov. 18.—With an unsatisfied demand estimated by some sellers

at close to 300,000 tons and with many definite inquiries simply filed, without probability of their being closed, the pig iron market in Chicago is strong as to price and tight as to the possibility for placing tonnage. The principal seller of northern iron is definitely out of the market, the only sales recently being carlots as an accommodation to a few regular customers in need. No contracts are being made. Southern makers are out of the market as well. One recently offered some iron at $31, Birmingham, and after one day retreated from the market with about 25,000 tons booked. The Virginia Iron, Coal & Coke Co. is offering some iron at about $33, furnace, for silicon 1.75 to 2.25, with a freight rate of $4 to $5 to Chicago. Some iron from the valleys is being sold here at $30 to $31, furnace, for silicon 1.75 to 2.25. These prices are expected to be replaced by higher figures shortly. Demand for malleable has lessened the past few days, probably because of impending shortage of coal. An important automobile manufacturer in Michigan is about to close for 10,000 tons of about 5 per cent iron. A Wisconsin foundry is asking for 3000 tons of foundry. An automobile manufacturer recently inquiring for a round tonnage is understood to have been able to close only a portion of the amount desired. A recent sale of 600 tons of foundry iron was made to a northern Illinois melter for first half. Other lots of 300 to 1000 tons have been closed. Silveries apparently are not obtainable from any source. An inquiry for 200 tons of 8 per cent for second quarter is unplaced. Production is increasing here, all merchant stacks being in blast except two small ones at the plant of the Iroquois Iron Co. and one at Bayview. The Wisconsin Steel Co. has two of its three furnaces in blast.

Ore Business

At Low Ebb—Price Increase Anticipated for 1920

Cleveland, Nov. 18.—Business in the ore market is at low ebb, neither furnace interests nor ore operators displaying any interest at this time in possible requirements for 1920. Some operators anticipate a general increase in prices of ore for next year, basing their opinion on developments in the pig iron market and the labor situation, and until a clearer perspective can be obtained on prices little activity is expected in the market. Furnaces are taking more ore than at any time since the beginning of the strike, and low phosphorus ores for foundry grades are in special demand.

Shipments from the upper lakes have slowed up considerably, due to the freezing of the ore and rough weather on the lakes. Forty vessels are now waiting cargoes. Shipments up to the twelfth of this month amounted to 1,635,000 tons, and operators expect to bring down about 800,000 tons before the season closes. This would bring the total shipments for the season up to 46,413,414 tons, as compared with 61,156,732 tons last year.

Strike Still Affects Coke

Miners' Failure to Resume Work Increases Demand From Steel Companies—Spot Scarce at $6—10,000 Tons for 1920 Placed at $5.75

Pittsburgh, Nov. 18.—The coal miners' strike still is a factor in the coke market, for failure by the union miners to resume work leaves steel companies' by-product plants without sufficient coal to be fully operated, and necessitates coke purchases on the open market. Although there has been a substantial gain in the beehive oven production, contracts are being specified against fully and some extra tonnages are being asked. This condition keeps the market barren of any spot offerings and $6, ovens, is about as low as any tonnages are being sold. There is basis for a price of $6.25, ovens, since to secure sufficient supplies, a Pittsburgh steel company has agreed to pay that much. This, however, is an emergency demand; the great bulk of tonnage is moving at around $6. The quotation of $5.75, ovens, applies chiefly to extra demands of consumers covered by contract. None of the Pittsburgh district coal operations, which were shut down by the strike, has yet resumed. Inquiries for first half furnace coke are numerous and one contract has been placed for 10,000 tons a month at $5.75, ovens. It is doubtful if this price could be bettered today. Most beehive oven operators are embodying in their contracts a clause which provides that the buyer will pay 50 per cent of any wage increase that may be made to miners or coke oven workmen. The contract market today stands at $5.75, ovens, on fixed price contracts, but forward business is brisk only as far as negotiations. Some talk is beginning to be heard of sliding scale contracts, with producers naming ratios of 5 and 5½ to 1 on basic iron, valley furnace. No business of this sort yet has been closed, however. Spot foundry coke takes a range of $6.50 to $7.50, ovens, but $7 appears to be the more general price. Higher figures refer chiefly to small emergency demands, while $6.50 rules for extra tonnages sought by customers from regular supply sources. The contract market on foundry coke is undefined. Production of coke in the Connellsville regions for the week ended Nov. 8, is estimated by *The Connellsville Courier* to have been 248,676 tons, against 202,500 tons in the previous week.

Foundries Well Supplied

Boston, Nov. 17.—The demand for spot coke which reached its height about a week ago, exceeded the capacity of the by-product plants supplying New England trade, and as a result, shipments now are in many cases overdue. The high point in spot coke trading has passed, however, and with the coal strike at an end, no further heavy buying is expected during the balance of the year. Foundries as a rule throughout New England are well supplied either with stocks or on contract. The past week has seen Connellsville coke shipped into New England at $11.65 delivered which is 25 cents above the spot market for by-product coke. The demand for 1920 coke is strong, and a flat price of $11.90 holds firm.

Sales Continue Active

New York, Nov. 17.—Coke sellers report continued activity in this district for delivery both this year and next. Beehive foundry coke continues to bring $6.50 to $7, Connellsville, both for this year and first half. The northern New Jersey by-product cokemaker is selling actively at $7, Connellsville, equivalent to $10.10, delivered at Newark and other northern New Jersey points, for shipment this year or over the first half. For shipments to New England, it is asking $7, Connellsville, or $11.40, delivered New England, for this year and $7.50, Connellsville, or $11.90, delivered New England, for first half.

Cincinnati Market Easing Off

Cincinnati, Nov. 17.—Uncertain conditions surrounding the coal strike cause considerable uneasiness, but so far purchasers in the Connellsville district have been able to fill customers' requirements. The situation is said to be easing off considerably, although spot furnace and foundry coke prices are still above contract quotations. Connellsville prompt furnace prices are around $5.50 to $6, and contract figures from $5.50 to $5.75. Foundry coke in that field is bringing from $7.50 to $7.75 for nearby shipment, and from $6.50 to $7 on contracts. New River foundry coke is still very firm and some has been sold for spot shipment as high as $11. The Wise County supply of foundry coke is improving and from $8 to $8.50 is quoted, the last named figure representing spot delivery.

Brisk Demand at St. Louis

St. Louis, Nov. 15.—Consumption of coke continues on a large scale, and demand from all quarters is brisk. Inquiries are out for 10,000 tons, mostly foundry grades. Deliveries from the East have been less satisfactory and efforts to accumulate have met with indifferent success. The price for 72-hour Connellsville coke was $7 during the past week, although some small tonnages were sold slightly under that figure. There is little selling for next year. The leading by-product interest reports virtually no inconvenience from the coal strike.

Makers Won't Sign Contracts

Birmingham, Ala., Nov. 18.—A better feeling exists in the coke market as coal production returns to normal. Contracts are being offered southern coke makers, but will not be considered until coal wage difficulties are adjusted. Some intimation is to be heard as to an advance in coke, but $9 is still quoted on foundry and $7.50 on furnace. Some Virginia coke was offered consumers in this state during the past week.

Scrap Prices Advancing

Market Shows Rising Tendency in all Centers—Up $2 in East—Buffalo Has Inquiry for 100,000 Tons of Steel

FOR COMPLETE SCRAP PRICES SEE PAGE 1422

St. Louis, Nov. 15.—Scrap prices have been further advanced, as in addition to professional buying, the industries are taking on tonnages. Supplies are scarce and little material is filtering in. Foundries are eager for scrap because of the scarcity of pig iron and the fact they have booked large volume of business. The same is true of rolling mills, while steel plants, also are displaying more activity. A liberal tonnage has been shipped to Chicago, particularly malleable iron. In the past ten days railroad malleable has advanced from $18 to $25 per ton, and there seems to be no limit to demand. Cast scrap continues in urgent demand, and is higher. Stove plate moved upward, and is $24.50 to $26.50. Rerollers were steady at the preceding week's quotation, but in strong demand. Heavy inquiries for relaying rails are meeting with no response here, there being virtually none available. Iron rails jumped $2 to $27. Railroad offerings were light, the only new list before the market being that of the St. Louis Terminal Railway association for 650 tons. The Wabash list of 1500 tons from the week before was sold at top prices.

Heavy Demand in New England

Boston, Nov. 17.—All foundry grades of scrap iron continue in good demand, with the available supplies inadequate to the needs of consumers. In several instances $32.50 has been paid for No. 1 machinery delivered to foundry. Borings and turnings are both in demand, and hard to obtain, and in fact, all grades of scrap may be said to be active, although the actual tonnage represented in the trading is not excessive. An order for 300 tons of wrought iron pipe placed during the week brought that grade into prominence. The scarcity of pig iron indicates continued firmness in scrap prices.

Borings and Turnings Up $1.50

New York, Nov. 17.—Heavy demand in conjunction with a scarcity has sent prices of mixed borings and turnings up $1.50, the market holding at $13.75 to $14.25, f.o.b. New York. An outstanding sale of this material during the past few days involved approximately 10,000 tons for shipment to Bethlehem. Active buying is noted in practically all descriptions, with the possible exception of wrought scrap, which continues to lag. Prices on wrought pipe and railroad wrought, nevertheless, have advanced in sympathy with the upward tendency in other quotations. Wrought pipe is now quoted at $16 to $16.50, f.o.b. New York, and No. 1 railroad wrought at $26. Among other grades to advance, are heavy melting steel, quoted at $17 to $17.50; old steel shafting, $24 to $25; machine shop turnings, $13.50 to $14; and machinery cast, $25 to $26.

Practically All Grades Advance

Philadelphia, Nov. 18.—Nearly all scrap prices have advanced here from 50 cents to $2 per ton. These advances were on a comparatively small volume of business. Dealers, generally are holding for several dollars higher than the market. A big unsatisfied demand for steel is evidenced by the fact that steel mills are taking lighter grades of scrap at lower prices, such as forge and bundled sheet scrap. Eastern heavy axle and forge turnings were sold to a Pittsburgh consumer at $21, delivered.

Prices Still Are Climbing

Pittsburgh, Nov. 18.—Although the steel manufacturers in this district are not heavy buyers of scrap at present, the market keeps on climbing under the influence of the activity and strength of eastern districts. Some of the steel manufacturers who have been picking up odd tonnages of heavy melting steel at around $21.50, delivered, now report that even small lots cannot be bought for less than $22 and on large tonnages claim that sellers are unwilling to consider a price below $23. Not only is there an apparent scarcity of this grade, but sellers' price views also are influenced by the strength of the pig iron market. Ordinarily the spread between basic pig iron and heavy melting steel is only a matter of a few dollars, while today on a basis of sales there is a spread of $8. A sharp rise in the price of heavy melting is predicted by sellers once the steel companies begin to buy in earnest. Baled and bundled sheets are slow of sale in this district, being taken quite freely in the East, and the consequent strength in prices is reflected here. With the eastern steel companies paying $20 or better for cast iron borings, consumers in this district have been obliged to raise their bids to secure tonnages. Foundry scrap grades still are in strong demand with sales of No. 1 cupola cast being noted at $29 and $30, the latter being the more general. An advance of $1 has been reported in malleable scrap due to a good demand and light offerings. A Pittsburgh district steel company paid $25 for heavy breakable cast and sales of low phosphorus scrap are noted to a steel foundry.

Buffalo Market Strengthens

Buffalo, Nov. 18.—Scrap has strengthened, prices of almost every grade increasing sharply. Local and outside mills are in the market for a large tonnage. Dealers say they have before them the greatest volume of inquiry since the beginning of the year. Demand is strong from all points, with little heavy melting steel to be had. Dealers think that the rising pig iron market indicates new prices in scrap, and there is a disposition to hold on to supplies. There is total inquiry current for over 100,000 tons of heavy melting steel, one local mill seeking 25,000 tons. Demand for cast iron borings and machine shop turnings also is strong.

Offer Higher For Steel

Cleveland, Nov. 18.—Local users of heavy melting steel are entirely out of the market, but $22 to $22.50 is being offered for steel for delivery at Lorain, O., which takes a 90-cent freight rate from Cleveland. Some selling is reported at $22, or $21.10, Cleveland. Several of the larger dealers, puzzled by the market, maintain they will not sell any steel on contract for less than $25. Foundries continue heavy buyers of cast grades, and the scarcity of this grade is becoming acute. Many inquiries are in the market, mainly for 1000 to 1500 tons. Dealers say melters are "shopping," and appear willing to buy if they are quoted what they consider a reasonable price. Dealers are quoting above the present level, feeling scrap will move up. Increases have been made in the quotations on melting steel, short steel rails, stove plate, cast iron borings, large and small forge flashings, rerolling rails, car wheels, railroad and agricultural malleable, pipes and flues, No. 1 busheling and axle turnings.

Great Strength Evident

Chicago, Nov. 18.—Although conditions in the scrap market at Chicago are relatively quiet, indications in the East are that an unusually strong market is to follow. Demand for heavy steel is fairly quiet, but nothing in present conditions indicates that accumulations in the hands of dealers will be disposed of for some time. Malleable grades are in strong demand and sales have been made at $28 per gross ton. Practically all foundry grades are relatively scarce and demand is heavy. As an indication of the market's strength, deals have been practically closed in the East by a Chicago firm represented there for one lot of 40,000 to 50,000 tons of shells, another of 25,000 tons, a third of 10,000 tons and several scattered lots involving smaller tonnage. Probable interruption of operation by bar iron and rerolling mills on account of lack of coal will have little effect on the market, as it probably will be only temporary. Railroad offerings at present are negligible. The Chicago Great Western is offering 450 tons and the Chicago, Burlington & Quincy 250.

Cincinnati Market Firm

Cincinnati, Nov. 17.—All grades of scrap are firm but prices remain unchanged. The car situation is much improved and shipments to Pittsburgh-Youngstown district are moving more freely. Offerings are heavier, although there is not much railroad scrap under negotiation. Although no changes have been made in last week's quotations dealers generally seem to think that the market will continue to grow stronger and

in a short time further advances may be justified.

Southern Market Stronger

Birmingham, Ala., Nov. 18.—Scrap prices have been revised, the southern market being much more active. Cast and stove plate are most in demand, although there is a good market for low grades of scrap. Government scrap is scarcer, but more industrial and agricultural material will be offered soon after the new year.

New Orders

Generally Declined in Tubular Goods But Some 1920 Tonnage Accepted

Pittsburgh, Nov. 18.—Conditions in the market for tubular goods are much as they have been for several weeks, with makers generally sold well into 1920 and showing a disposition to decline new orders. In the case of oil country goods, however, it is understood that some producers are taking 1920 business, the tonnage to take the price prevailing at the time of delivery. The La Belle Iron Works, Steubenville, O., started up in a small way this week but production has not improved much in the district. In Youngstown, O., the Youngstown Sheet & Tube and the Republic Iron & Steel Co. are making gains, and the A. M. Byers Co. is doing better at both its Girard, O., and Pittsburgh plants. The National Tube Co. maintains practically full operations at all of its plants and the Jones and Laughlin Steel Co. reports 100 per cent operation at its pipe mills.

Private Inquiry is Good

New York, Nov. 17.—A lot of 1500 tons of 36-inch cast iron pipe is being inquired for by this city and bids are to be opened Nov. 22 by the water department. Aside from this, public demand is small. Private inquiry, however, continues to hold up well, and the position of the shops in the East generally is good. Virtually all are booked up to the first of the year, especially on the smaller sizes. Owing to labor shortage and labor inefficiency, operations are running around 60 per cent.

Sell Much Small Pipe

Chicago, Nov. 18.—Although formal lettings of cast iron pipe tonnages are comparatively few, sellers are taking considerable business, especially for small sizes, by direct purchase instead of by formal lettings. This business and the ordinary routine orders from contractors make the market fairly active, even though larger tonnages are absent. The United States Cast Iron Pipe & Foundry Co. was the only bidder on 940 tons for the city of Chicago, and probably will be awarded the business.

Expect Activity Through Winter

Birmingham, Ala., Nov. 18.—No seasonal interruption is expected in the cast-iron pipe trade, as specifications in hand warrant steady operation for some time, and new business is in sight. More labor is available and plants are producing in good quantity.

Books Sheets for 1920

American Sheet & Tin Plate Co., Takes First-Half Business at March 21 Prices—Production Allotted—Independents Follow Present Schedule

Pittsburgh, Nov. 18.—The American Sheet & Tin Plate Co. has opened its books for first-quarter and first-half business and has named the same prices which have been in effect since March 21 last. This means that for the first six months of 1920 this company will take business in black sheets for both sheet and tin mill use at a base of 4.35c, Pittsburgh; 5.70c, Pittsburgh, for galvanized, and 3.55c, Pittsburgh, for blue annealed. The company apparently is pretty well sold into 1920, for with the announcement of the opening of the books comes the statement that it will be necessary for it to allot its production. Thus far the independent interests have taken no action with regard to prices for first half. In view of the action by the leading interest it is probable they will hold to present schedules, although sentiment in favor of an advance is known to be strong among some of them. Current demands for all kinds of sheets are large but particularly so in the case of automobile and other highly finished stock. Few makers of automobile sheets are abreast of their live obligations and the makers of pleasure cars are making numerous inquiries and offering premiums in an effort to secure tonnages that will enable them to keep up to their production schedules. Premiums also are obtainable on other kinds of sheets for early delivery. While mill operations and production are gaining steadily, makers still are behind in deliveries against contracts for galvanized sheets and also are somewhat short on black and blue annealed. The American Sheet & Tin Plate Co. now has 92 per cent of its sheet mills in operation while the independents are running close to 75 per cent of capacity. The showing would be still better if it were not for the fact that the Granite City, Ill., plant of the National Enameling & Stamping Co. still is down owing to a shortage of fuel.

Sheets Scarce in Valley

Youngstown, O., Nov. 18.—Shortage of sheets in the Mahoning valley virtually has reached famine proportions. Independent makers are sold up well into the first quarter, and, in one case, until about the middle of March. Probably never in the history of the valley have so many consumers visited the mills in an effort to obtain tonnages. Manufacturers give no assurances when they will offer their product freely. Mill schedules have been set back six weeks by the strike and makers cannot see their way clear to satisfy any new demands. Certain makers also are encountering trouble in locating tonnages of sheet bars at what they consider the right figure. An unprecedented demand exists for light-gage galvanized both for domestic and foreign consumption. Consumers of this grade are willing to pay most any premium for spot material, and offers from $15 to $20 above present quotations have been reported. The demand especially is pressing from makers of refrigerator linings, turpentine containers, etc. Dealers state they have customers who will buy most any grade of light sheets at high prices. Sheet quotations are practically worthless so far as the valley is concerned due to the fact that material is unobtainable. If the various grades were to be had, black would command from 4.55c to 4.80c, galvanized from 5.90c to 6.10c, and blue annealed from 3.75c to 3.80c. One sale of prompt sheets at 4.75c for black and 6.25c for galvanized was made this week.

Rail Contracts

Still in Final Stage—Japan Closes for Light Sections

Chicago, Nov. 18.—Contracts for standard steel rails for western railroads, aggregating about 200,000 tons, are still hanging fire, although part of the contracts have been carried up to the point of actual signing. This tonnage involves the requirements of about eight important lines, and the entire tonnage is expected to be closed before long. Light rails are in much demand for shipment to Japan and between 5000 and 6000 tons have been booked by the western mill, through its export connection. Demand for domestic use is only fair, as uncertainties of future mine operation prevent heavy buying. The Pullman Co. has received an inquiry for 70 cars for the South African railway. An inquiry from China asks figures on 200 high side gondolas. The Seaboard Air Line is inquiring for 11 mail, express and baggage cars.

Tank Car Order Detailed

New York, Nov. 17.—It is learned that the car business placed by the Union Tank Car Co. was somewhat less extensive than first reported. Instead of placing 4000 cars, this interest placed 2500, of which 1000 will be built by the Standard Steel Car Co. and 750 each, by the Pressed Steel Car Co. and the Cambria Steel Co. It is understood that the company also is going to build some tank cars in its own shops.

Trading Still Drags

Pittsburgh, Nov. 18.—While demand for standard rails in small lots is fairly good, and a fair amount of business is before makers, capacity is only partly engaged. The outlook, however, is considered good for it is known that the managements of the various railroads are making plans for the time when control will pass from the government. Some good export inquiries are coming out for light rails. Standard spikes are slow in selling in keeping with practically all other kinds of track material.

Bar Demands Increasing

Mills Heavily Booked Ahead—Implement Manufacturers Placing Tonnages — Pittsburgh Bar Iron Makers Again Advance

Chicago, Nov. 18.—Soft steel bars are in sharp demand and activity in this product is much greater than in shapes and plates. Inquiry is being received from all sources and every consumer apparently desires to get his order and specification in the hands of mills with the idea of obtaining as good delivery as possible. While mill operations are being improved steadily and production is heavier each week, delivery is difficult to promise with definiteness. It is possible to promise occasional small tonnages in 30 days, while some instances of bar orders cannot be promised short of six months. Agricultural implement manufacturers are covering their requirements for the first half of 1920, and it is understood no contract beyond the middle of the year has been undertaken by makers. While some makers have tended to ask higher than the prevailing price, western mills are continuing their quotation of 2.62c, Chicago.

Bar iron mills are increasing their backlog of orders as new contracts are taken in excess of shipments. The coal shortage, resulting from the present strike, has begun to affect these mills, and the Highland Iron & Steel Co., at Terre Haute, Ind., has been forced to close down for this reason. The mill of the Republic Iron & Steel Co. at East Chicago, has enough coal for a week or 10 days, and probably will shut down about the end of that period. The quotation on bar iron ranges from 2.72c to 2.77c, Chicago.

Hard steel bars rerolled from rails are almost impossible to obtain, as mills are sold up until the first of the year and lack of coal promises to shut down most of the plants within a short time. The quotation at present is 2.85c to 2.90c, mill.

Bethlehem Plant Resumes

New York, Nov. 17.—The puddling plant of the Bethlehem Steel Co., at Lebanon, Pa., which has been idle since last April, is being placed in commission. Ten of the 18 puddling furnaces which comprise the so-called active list at this plant are now operating. Altogether the plant embraces 22 puddling furnaces, but four of them have not been worked for a long time and are not regarded as active. Prior to last week no efforts were made to get the plant back in operation, due to the fact that demand for iron bars was not considered active. The Bethlehem Steel Co. now again is taking iron bar business. The bottom of the iron bar market here now is 2.60c, Pittsburgh, or 2.87c, New York, but business is being done in some instances, at 2.75c, Pittsburgh. Steel bars, being the most sold-up of the finished steel products, are involved mostly in a new policy which is being adopted generally by the mills. Due to their oversold condition, the makers are turning away all business offered by new customers, and the only new business they are placing on their books is tonnage absolutely required by regular customers going. It is easy to obtain from 2.60c to 3.00c, Pittsburgh, for steel bars for export, and in some cases more is being paid.

Eastern Mills Flooded

Philadelphia, Nov. 18.—Mills are flooded with orders for steel bars, and are accepting practically no new business, except when absolutely necessary to provide regular customers. The minimum on iron bars is 2.60c, Pittsburgh, and in some cases as high as 3.25c is asked.

Demand Still Ahead of Supply

Pittsburgh, Nov. 18.—In the lack of any material improvement in deliveries of soft steel bars, production of cold-finished steel bars still is inadequate to meet demand and consumers needing immediate supplies cannot buy much below the warehouse basis. It is reported several carloads of small rounds recently came into the Pittsburgh district from a Philadelphia warehouse at a price of 5.00c Philadelphia plus the freight. On straight mill business a base of 3.60c, Pittsburgh, still is quoted, but only one or two of the Pittsburgh district makers are accepting any new business at present. Production of bessemer screw stock is especially affected by the lack of steel bars. It is probable that much 1919 business will be carried over into next year.

Iron Bars Advance Further

Pittsburgh, Nov. 18.—Another advance of $3 per ton has been announced by leading producers of iron bars in this district, putting them on a base of 3.25c on common iron and 3.50c on refined. Increased costs and an extremely active demand are given as the cause. The situation in merchant steel bars remains extremely taut, and prices are for the most part on a nominal basis, as far as early tonnages are concerned. While the Carnegie Steel Co. continues to quote 3.25c base Pittsburgh, it is taking no business at that price and the quotation applies almost entirely to contract shipments. It is doubtful if any manufacturer today would be interested in less than 3.50c Pittsburgh. It is understood that some of the companies that are taking orders for delivery at their convenience are booking them with the understanding that the tonnage will take the price which prevails at time of delivery.

Bolt Demand Strong

Chicago, Nov. 18.—Manufacturers of bolts and nuts find their plants overloaded with much business being offered in addition to that already contracted. It is impossible to entertain more than a part of present inquiry. Bolt and nut plants are not likely to be affected by the coal strike, as gas and oil are used in heating operations and about the only use of coal is in the power house.

Price Tendency Strongly Upward

Pittsburgh, Nov. 18.—Prices of nuts and bolts, not only have advanced sharply but the market still is showing an upward tendency. Bookings before the steel strike were heavy, while as a result of the crippling of plants in and around Cleveland, huge demands have come in from buyers ordinarily served from that district. Getting out this business has been seriously hampered by the shortage in steel bars and as supplies of the latter only are available at advances over the contract base, the advances for the finished product have resulted. Track bolts still hold at the old base of 4.50c, Pittsburgh, in carload lots, but at the moment, there is no carlot business and on the small quantities to jobbers, most makers are quoting 5.90c base, Pittsburgh. No change is noted in rivets, but with rods and bars scarce and costly, the tendency is toward higher levels. Some makers are not inclined to consider any business at less than 4.10c for structural, 4.20c for boiler and 50 per cent off list on small rivets.

Foreign Inquiry

For Spiegeleisen About to Be Closed —Ferromanganese Sales at $110

New York, Nov. 17.—It is understood that an export inquiry for 1000 tons of spiegeleisen is on the point of being closed. The original lot may be increased and 1500 tons ordered at a price already quoted. Domestic spiegeleisen business is of fair proportions, mainly of carloads which are bringing $35, furnace, for 18 to 22 per cent. There is a lack of inquiries to test the market on bigger tonnage.

While the English makers of ferromanganese continue out of the market because they are sold up, domestic makers are booking fair tonnages. Several blocks, none of which is especially large, have been placed during the past week for first half shipment, at $110, delivered, for 78 to 82 per cent metal. This figure is regarded as the minimum. Spot ferromanganese continues scarce.

The ferrosilicon market appears to have strengthened somewhat, following a dip below $80, delivered. Some producers have steadily refused to quote below $90, delivered. Recent sales at $82, delivered are reported. Production continues slow and stocks are believed to have been greatly depleted.

Considerable interest continues to be attached to foreign offerings of ferrotungsten and ferrochrome. A bill recently was introduced in the house to levy a duty of 11½ cents on imports of ferrochrome and 60 cents a unit on chrome ore. Ferrochrome running 4 to 6 per cent carbon still is offering as low as 27 cents pound contained, but most makers are asking 28 to 30 cents. Domestic makers of ferrotungsten are quoting $1.15 to $1.20 pound contained and

doing some business, but imported alloy is being offered for shipment below these figures.

Ferrovanadium is unchanged at $5.50 to $7 pound contained according to analysis and delivery.

Sales for First Half at $110

Philadelphia, Nov. 18.—Considerable business is being done in domestic ferromanganese for the first half at $110, delivered. One English maker would take orders at $125, tidewater, but this price is not a factor. About 1500 tons of spiegeleisen sold for the first half at $35, furnace.

Market is Looking Up

Pittsburgh, Nov. 18.—A distinctly firmer tendency is observed in prices of ferroalloys. While prices are no higher than they have been, based on actual sales, the demand is much better than it has been and this is having its effect upon producers' price ideas. Several small lots of 80 per cent domestic ferromanganese lately were sold at $110, and that figure is said to be the bottom.

The Crucible Steel Co. recently closed on 500 tons of 50 per cent ferrosilicon for five months delivery. While some doubt exists as to the price paid the common impression is that it was in the neighborhood of $78, delivered Pittsburgh. Canadian material was furnished and deducting the usual charge of $6.50 to $7 per ton for packing and package, this would be equivalent to about $71 for American metal. This sale is believed to have cleaned up all of the low priced Canadian product. Small sales of 50 per cent domestic ferrosilicon have been made at $85 and it is doubtful if that price today could be bettered. Most domestic producers are asking that price and some are quoting $90, quotations ranging even as high as $135.

Although the demand for bessemer ferrosilicon still is extremely light, production is small due to the fact that Ohio interests are not producing at present. One maker recently raised his price $2 a ton and is now quoting $56.75, furnace, for 10 per cent. Electrolytic ferrosilicon of lower content is being offered at $55, delivered Pittsburgh. In view of the high prices which prevail for the lower grades of ferrosilicon, some talk is heard of electric furnace interests cutting out 50 per cent material and going in more heavily on the former.

Small sales of ferrotungsten are being made around $1 a pound, while consumers have been able to pick up tonnages of ferrovanadium at $5.75 a pound.

Starts By-Product Plant

Chicago, Nov. 18.—The Wisconsin Steel Co. has started the production of by-product coke at its plant at South Chicago. This plant is designed to make the steel plant independent of coke from the beehive districts and removes practically the last user of beehive coke in the Chicago district. A reserve of coal for conversion into coke has been accumulated and the coal strike will not affect this plant for some weeks.

Plate Sales Are Higher

Eastern Mill Books Large Tonnage at 2.75c and 2.85c—Tank Car Lot Placed—Oil Field Demands Heavy

Philadelphia, Nov. 18.—The best plate delivery which now can be had from eastern mills as a rule is eight weeks and most of these mills have enough business on their books to take their capacity for three to four months. One eastern mill has taken many thousand tons in the past week at 2.75c mill or Pittsburgh depending on location of the consumer. It quoted 2.85c in some instances to discourage buying but orders were placed at this figure. This interest is turning away thousands of tons including a large tonnage for which Pittsburgh district consumers are desirous of paying 2.75c eastern mills. Other mills have not yet departed from the price of 2.65c, Pittsburgh, but are taking very little business. There is some conjecture here whether or not the leading interest's decision not to take any further business may be forerunner of a price advance by this interest for the first quarter. As stated months ago by THE IRON TRADE REVIEW no advance is expected by this interest this year.

Plates for Tank Cars Placed

New York, Nov. 17.—It is estimated that for building 2500 tank cars ordered by the Union Tank Car Co., some 40,000 tons of steel, exclusive of axles and wheels, will be required. Practically all of this tonnage is plates, shapes and bars, principally plates, and it is understood this business has been closed. New plate tonnage continues to be offered to the mills faster than they want to book it, particularly from export sources. Export orders offered during the past week ran into thousands of tons. Such of this business as the mills can take they are having no trouble in booking at 2.65c, Pittsburgh. Some business has been booked at the new price of 2.75c, Pittsburgh, or mill, to which the Lukens Steel Co. advanced a week ago.

Price is Firmly Maintained

Pittsburgh, Nov. 18.—Makers of plates in this district still are quite fully committed and have little tonnage available to ship against current inquiries. This condition finds full reflection in prices, the market being extremely firm at 2.65c, base Pittsburgh, although several attractive inquiries recently have come out carrying a price somewhat below this figure. Among them was one for more than 2500 tons from a Pittsburgh district car company, which after being shifted about freely in the market, finally was placed at the full price. A few heavy sheared plates are being offered for early delivery, but makers are sold up pretty well to the end of the year on stock such as is required for tanks and fabricated structural material.

Oil Trade Big Factor

Chicago, Nov. 18.—Largely increased demand for steel plates has been evident in the market for several weeks, and is increasing. This is largely due to activity in the oil fields, which calls for tanks and tank cars. As illustrative of this demand, an inquiry has just been received for 10 oil tanks in the southwestern oil field which will require 1500 tons of steel plates. The Union Tank line has placed an order for 1000 tank cars with the Standard Steel Car Co., which will involve 11,000 tons of plates, 2500 tons of shapes and 1600 tons of axles. The quotations is firm at 2.92c, Chicago.

Tin Plate Bookings

For First Half Taken by Leading Maker at March 21 Base

Pittsburgh, Nov. 18.—The American Sheet & Tin Plate Co. last Saturday opened its books for orders for tin plate for the first quarter and first half of 1920 naming the same price which it has quoted since March 21 last, or $7 per base box, Pittsburgh, for standard coke plate. The company, however, will carry over considerable business into next year as a result of the strike and it will not be possible for it to take on much business for shipment during the first few months of the year. Independent producers have not yet announced the opening of their books for 1920, but it seems probable that they will also quote the present base, not only because the leading interest has left the price unchanged but also because this company also left the schedules on the tin mill black sheets at 4.35c, base Pittsburgh. No let-up is noted in the demand for tin plate but only a few makers are in a position to take on much business for early delivery owing to the fact that they have considerable unfilled tonnage. Some of the independent companies are quoting $7.50, Pittsburgh, against expert inquiries which still are numerous, especially from Japan.

Export Buying Difficult

New York, Nov. 17.—Although at least one tin plate maker, an eastern interest, has been taking domestic business in tin plate recently, at $7 Pittsburgh, per base box, it has been difficult for exporters to place orders at anything like this figure. One export house about a week ago placed some tin plate at $7.60, Pittsburgh, equivalent to $9, Kobe. Now, considerably higher prices are asked, and one maker, on an inquiry for export, has quoted $8.60, Pittsburgh.

The plant of Root & Van Dervoort-Wagner Ordnance Co., at Moline, Ill., has been purchased by the Root & Van Dervoort Co. The properties of the company adjoin and the merger will permit of an immediate expansion of output.

Structural Jobs Hold Up

Contracts Let in October Aggregate 77½ Per Cent of Capacity as Compared With 78½ in Previous Month—Recent Awards Plentiful

New York, Nov. 17.—In accordance with expectations, structural lettings in October fell off slightly. Contracts, as shown by the regular monthly statement of the Bridge Builders & Structural society just issued, aggregated 139,500 tons, or 77½ per cent of capacity, as compared with 141,000 tons, or 78½ per cent in the preceding month. During the past week the local structural market has been more active than in the earlier part of the month. Awards have been more plentiful and new inquiries have been noted in greater number. Several lots involving 1000 tons and over have been included. The largest of these amounts to about 4000 tons for factory buildings for the Willys Corp., Elizabeth, N. J. Another sizable lot involves 2000 tons for a power plant for the Penn Public Service Corp., Johnstown, Pa. The American Bridge Co. appears to have booked the most business. Following is a comparative statement of monthly bookings reported by the Bridge Builders' society:

Month	Per cent	Approximate tonnage
October, 1919	77½	139,500
September	78½	141,000
August	78½	141,000
July	74	133,200
June	65	177,000
May	49	88,200
April	24½	48,100
March	17½	32,300
February	12½	22,500
January	12	21,600
December, 1918	29	52,270
November	27	48,700
October	43	77,400
September	60	108,000
August	57	102,000
July	116½	209,700
June	56	100,800
May	60	108,000
April	64	115,200
March	47	84,600
February	55	99,900
January	53	95,400
December, 1917	121	205,200
November	77	138,600
October	61½	110,700
September	29	52,200
August	38	68,400
July	41½	74,700
June	47½	85,500
May	56½	102,000
April	61	110,000
March	68	122,000
February	59	106,000
January	61½	119,000
December, 1916	86	148,000
November	78	134,000
October	77	133,500
September	52½	99,400
August	64	112,000
July	47½	83,600
June	58	100,000
May	80	137,000

Construction Recovering in Boston

Boston, Nov. 17.—The future outlook for New England construction has a more favorable aspect than at any time in many months and buildings already awarded for early spring construction in Boston will take a round tonnage of structural steel. The time seems to have arrived when demand for space compels construction in spite of continued high prices.

Eastern Bookings Increase

Philadelphia, Nov. 18.—Business on the books of shape mills has been greatly increased in the past week, and some eastern makers are now arranging rollings for February. One mill has a uniform policy of accepting no business from the regular trade netting less than 2.55c, mill, and from new customers netting less than 2.65c, mill. Other makers still hold at 2.45c, Pittsburgh. All makers say they have all the business they want.

October Bookings Heavy

Pittsburgh, Nov. 18.—Structural awards during October made a surprisingly good showing, according to the figures compiled by the Bridge Builders Structural society. They amounted to 104 per cent of theoretical shop capacity of the independent fabricating interests. These figures, of course, exclude contracts placed with the American Bridge Co. Last month was not a particularly active one in this district, but evidently the country at large went forward with new projects more freely than was the case here where the steel plant strike exerted an influence on investors. A much more cheerful feeling prevails among the fabricating interests, for several awards have come here and at better prices than recently were obtainable. No diminution is noted in the volume of inquiries and the growing belief that deliveries will be somewhat delayed until normal conditions are restored at the steel plants makes buyers a little more anxious to be covered. Shape mills here are heavily booked as a result of demands resulting from mills in other districts being crippled by labor disturbance. Small tonnages of large angles, beams and channels are offered for early delivery, but on small shapes, makers have about all the business they can take care of during the remainder of the year.

Canadian Mill Seeks Orders

Buffalo, Nov. 18.—The Algoma Steel Co., Sault Ste. Marie, is now soliciting orders for structural shapes 15 inches and under. It began operating its new structural mill within the week.

Several Jobs Let at Cleveland

Cleveland, Nov. 18.—Several fair-sized structural jobs were let in the Cleveland district during the past week but the volume of structural work is falling off. The Harris Structural Steel Co., Chicago, took 750 tons for the Cleveland Theater Co.'s building at Euclid avenue and 117th street, but the contract for 500 tons for the theater which this company is to build at Euclid avenue and 101st street has not been let. The Canton Bridge Co., Canton, O., obtained the contract for 600 tons for a new steel plant to be built by the Canton Sheet Steel Co. Additional structural lettings are said to be in sight in connection with this plant. A large tonnage will be needed for new buildings to be erected for the Goodyear Tire & Rubber Co., Akron, O., the general contract for which have been let to the Hunkin-Conkey Construction Co., Cleveland. One large maker sold a considerable tonnage of plain shapes and plates for delivery this year to fabricators in this district during the past week at 2.45c, Pittsburgh, or 2.62c, Cleveland.

Much Tonnage in Prospect

Chicago, Nov. 18.—Lettings of structural steel in the west recently are headed by the Aetna Iron & Steel Co., which has awarded 1259 tons for a sheet mill building at Gary, Ind. Other lettings are relatively small. It is understood that the Lanquist & Illsley Co. of Chicago has been awarded a tentative contract for the construction of the Buffalo Enquirer building, at Buffalo, N. Y., which will require 3700 tons. It is understood further that the Bethlehem Steel Co. will furnish the steel. Another large inquiry comes out of Buffalo, the Connors building, requiring 3500 tons, being in prospect, and fabricators are being asked by contractors to give protective bids. Plain material is steady at 2.72c, Chicago. Bids have been taken on three units of the Union Railway station at Chicago, aggregating 17,000 tons,

CONTRACTS AWARDED

Office building for General Electric Co., Schenectady, N. Y., 500 tons, to the American Bridge Co.

Air coast defense station, Staten island, N. Y., 700 tons, to American Bridge Co.

Additions to Passaic Cotton Mills, Passaic, N. J., and Fall River, Mass., 600 tons, to American Bridge Co.

State power plant, Marcy, N. Y., 325 tons, to American Bridge Co.

Further addition to Cheswick power plant, near Pittsburgh, 500 tons, to American Bridge Co.

Building for Proctor & Gamble, Dallas, Tex., 450 tons, to American Bridge Co.

Telephone exchange on East Thirtieth street, New York, 2000 tons, to Hay Foundry & Iron Works.

Factory building for General Aluminum & Brass Mfg. Co., Marysville, Mich., 900 tons to the American Bridge Co.

Boiler house and power house for the Morgan & Wright Co., Detroit, 1900 tons to the American Bridge Co.

Boiler repair shop for the Pennsylvania railroad, lines west, Fort Wayne, Ind., works, 700 tons to the American Bridge Co.

New building for American Steel Foundries, Alliance, O., 450 tons to the McClintic-Marshall Co.

Factory building for Western Electric Co., Chicago, 3000 tons, to the McClintic Marshall Co.

Building for Standard Tank Car Co., Masury, O., 400 tons, to the McClintic-Marshall Co.

Sheet mill building at Gary, Ind., for the Aetna Iron & Steel Co., 1259 tons, to Northwestern Bridge & Iron Co.

Building for the Cole Motor Co., Indianapolis, 869 tons, to reinforced concrete.

Addition to the Hearst building, Chicago, 163 tons, to American Bridge Co.

Theater for Cleveland Theater Co., 750 tons; let to Harris Structural Steel Co.

Steel plant for Canton Sheet Steel Co., Canton, O., 600 tons; let to Canton Bridge Co.

Building for Guide Motor Lamp Co., Cleveland, 200 tons; let to Fort Pitt Bridge Works.

Building for Republic Brass Co., Cleveland, 200 tons; let to Merty Iron Works.

CONTRACTS PENDING

Loft building for National Tailors, Fourth avenue, New Yorw City, 1400 tons; pending.

Loft building on Livingston street, Brooklyn, 1000 tons; bids asked.

Factory buildings for Willys Corp., Elizabeth, N. J., approximately 4000 tons; pending.

Theater building, Baltimore, 1100 tons; pending.

Fertilizer for Armour & Co., Baltimore, 700 tons, Westinghouse, Church, Kerr & Co., contractor, New York; bids in.

Power plant for Penn Public Service Corp., Johnstown, Pa., 2000 tons; pending.

Connors building, Buffalo, N. Y., 3500 tons. Contractors taking bids.

Building for Coca-Cola Co., New Orleans, 400 tons, bids in.

Temple for Scottish Rite, Bloomington, Ill., 320 tons, revised bids being taken.

Hot metal mixer building for Inland Steel Co. Indiana Harbor, Ind., 370 tons, bids being taken.

Office building for Euclid-Windsor Co., Cleveland, 200 tons; bids being taken.

Loft building for Benjamin Hass, New York, 2400 tons; pending.

Addition to pressed steel and forging plant of A. O. Smith Corp., Milwaukee, 4800 tons, bids being taken.

Little Tonnage

Of Sheet Bars Open to Purchase—Wire Rods Sell High

Pittsburgh, Nov. 18.—Finishing mills which need sheet bars immediately probably will be unable to buy them at less than $45, Pittsburgh or Youngstown, as compared with the March 21 base of $42, at which price tonnages are moving on contracts. While the market is short of this class of semifinished steel, the fact that none of the sheet or tin plate mills has been obliged to suspend for want of steel makes it apparent that the scarcity is not acute. Sheet mill capacity of the country now is close to 80 per cent engaged, while makers of tin plate have between 65 and 70 per cent of their capacity in operation. It cannot be said that finishing mills are suffering much for want of billets, although manufacturers seeking open market supplies for prompt shipment find they cannot do better than $40.50, Youngstown or Pittsburgh. Prices of wire rods have risen considerably more than other forms of semifinished steel as a result of the strike conditions. Few makers of rods have any surplus over their own requirements for sale, while the excellent market in wire and wire products makes for a sharp demand for rods from the nonintegrated manufacturers. The current market may be quoted from $60 to $63 for soft rods, while as high as $68 recently was paid for export. One maker reports having declined 1500 tons of rods for which the inquirer made a bid of $60.

Few Tonnages Now Offered

Youngstown O., Nov. 18.—During the past three weeks the slack has been taken up in the sheet bar market and few tonnages now are offered. Whether any tonnages of either openhearth or bessemer grade can be bought here now for less than $46 is a matter of doubt. In fact one sale in the Chicago district is reported at over $50. The advance of sheet bars will not be so noticeable at sheet plants equipped to roll the semifinished material as at plants which depend on outside mills for this steel.

Sheet Bars Wanted

Cleveland, Nov. 18.—Some interests which are both makers of sheet bars and sheets are in the market for round tonnages of the former material but are having difficulty to cover their needs. One of these companies in the Mahoning valley bought some tonnage at $45, Pittsburgh. The semifinished market is very firm with offerings limited. A local buyer paid $65 for a small lot of wire rods. Eastern makers are naming $54, Pittsburgh on forging billets. The local semifinished producer now is running its steel works practically full with 12 of 14 open hearths in operation.

Warehouse Stocks Low

New York, Nov. 17.—Excepting plates and structurals, supplies in the local warehouses are said to be lower than at any time this year. Mill deliveries, while slightly improved, are not sufficient to relieve the existing shortage. Sheets and bars are said to be especially scarce.

Boston Schedules Higher

Boston, Nov. 17.—One of the largest warehouse interests in Boston reports a greater demand in some products than at any time in history, bars and sheets being especially active. Warehouse prices in New England have advanced in almost all cases. Individual interests have broken away from previous uniformity of quotation, and it is difficult now to give definite prices. Prices in effect as determined by several of the larger Boston interests are iron bars $3.55, shapes 3.50c, plates 3.95c, No. 10 blue annealed sheets 5.15c, No. 28 black sheets 6.65c, No. 28 galvanized sheets 8.00c, bands 4.85c, hoops 4.95c, and refined iron 3.75c.

Wire Prices

Are Being Bid Up by Consumers—Export Nails Sell High

Pittsburgh, Nov. 18.—Although makers of wire and wire products whose plants were crippled by the steel strike are restoring normal conditions, production is not yet at a rate that enables them to make much headway against their obligations. Little attention is given to new business, and even companies which were unaffected are going slow in accepting new orders. Such companies are filled up for the remainder of the year while the former have obligations that probably will carry them well into 1920. Quotations are nominal but 3.50c for nails appears to be about as low as should be quoted. While the American Steel & Wire Co. is holding to 3.25c, it is not accepting any business at that figure and still finds it necessary to apportion shipments among consumers who contracted at that figure. Actually 5.00c has been offered for nails and buyers have made a bid of 4.00c on plain wire which nominally is rated at from 3.00c to 3.25c.

Small Nails Ordered for Export

New York, Nov. 17.—An export order for 1500 kegs of wire nails has been placed at 5.65c, Pittsburgh. The order included mainly an assortment of small nails, and the price is not exceptional. One buyer says he paid $8 a keg, Pittsburgh, for 8-penny nails a few days ago. Nails are exceedingly scarce. In fact, all wire products are scarce, and instances are reported every day where manufacturers who use wire as a raw material are forced to shut down, at least certain departments of their plants.

Wire Demand Increases

Chicago, Nov. 18.—Although shipments of wire and nails are increasing weekly, as mill operation improves after the strike, present production apparently is not sufficient to meet consumption and scarcity of nails is especially noted. Jobbers are practically out of supplies, and the situation is assuming a serious aspect in view of the desire to push building operations in every part of the country.

† American Smelting & Refining Co.'s price.
‡Open market.

NEW YORK, Nov. 18.—The rescinding of the coal strike order favorably affected sentiment in the metal markets, outweighing the slump in the stock market, high call money rates, low exchange rates, and further delay in formal peace, although these factors of course exerted some influence, especially on exports. Improvement in steel mill labor was reflected by the appearance of several additional galvanizers in the zinc market and more interest was shown in tin. The uncertainty as to the ratification of the peace treaty exerted some influence, particularly on the copper market, which has been counting on the promulgation of peace to open the way rof financial arrangements that would enable American producers to fil European requirements.

The copper market now is wide open, with large and small producers and dealers in active competition for such small business as is developing. The market for electrolytic copper hung at 21c for nearly a week, when the producers went after business at 20 75c, and now have cut as low as 20.00c delivered. Casting also was marked down to 19.50c and 19.62½c and lake to 20.50c and 20.75c.

The lead market has been firm. One producing interest sold over 1000 tons last week on the basis of 6.90c, New York, although the leading producer continued to quote 6.75c, New York, 6.50c, St Louis. Outside lead cannot be purchased at St. Louis under 6.75c. Some New York prices are as high as 7.00c.

The zinc market has held firm at 8c, East St. Louis, for shipment this year, during several days. The appearance of several additional galvanizers as buyers, who had been out of the market for weeks previously owing to strike interference, had a heartening effect

The tin market has been relatively lower in New York than in England or the Far East, due to the accumulation of stocks resulting from the recently concluded longshoremen's strike. Straits tin for future shipment from Singapore and London is obtainable at 53.25c, New York; Straits tin ex steamer at dock, 53.25c; and spot tin in warehouse at 53.50c. Ninety-nine per cent tin is quoted 52.75c to 53.00c. Private cables from the Far East give quotations much above the current prices here, indicating a bullish feeling in the Orient.

Antimony has stiffened to 9.25c.

Export Difficulties Being Met

Responsible Steel Producers Resort to a Preferential List of Dealers—Japan Fills the Market With Orders—England Sends Various Inquiries to This Country—South American Business is Below Normal

NEW YORK, Nov. 17.—American iron and steel exporters are facing some awkward situations at present and conditions are more or less upset. According to some observers, however, an opportunity is being provided for a "shaking down" of the irresponsible agencies in the export field. It has been discovered that certain interests which have contracted with mills to dispose of a certain output in the foreign market have held that product in warehouses and resold in the domestic market in direct competition with the mill for which they were acting as agents. The market has also been full of inexperienced exporters who have caused no end of trouble to producers in requesting quotations of all sorts without any compensating orders resulting. Such business has caused unlimited work for the producers and the latter are becoming tired of their fruitless efforts.

Recently one of the largest steel producers resorted to a preferential list of exporters. This was followed by other large producers and today foreign sales practically are being limited to those houses which are known to be honestly in the export business and which refuse to speculate in commodities to the detriment of legitimate producers and consumers. This tendency toward the listing of responsible exporters has given added credence to the report that the big producers have enforced an embargo on American iron and steel exports. As a matter of fact there was a partial embargo during the strike and there still is a serious hesitancy on the part of American producers to accept new foreign business in the light of the present unsettled costs of production. American producers prefer to accept domestic orders because the terms for carrying out of a contract are much simpler. Foreign business has dropped off because there is little spot material to be had although the larger interests now declare they will open their books for 1920 deliveries.

From Tokyo a telegraphic report has just been received stating that the United States Steel Products Co. has cabled definitely that it is out of the market for the present. Inasmuch as the cable was brief and failed to make normal explanations, it is presumed that there were reasons why certain business in this particular case was refused. The sold-up condition of the mills and the indefinite cost problem, without doubt, prevent much business coming to the United States just at present. This situation is now much more serious than the economic conditions abroad, which is reflected in the lack of credits and the weakened exchange.

The market still shows interest in the large billet order received from Belgium. It was learned from the agency placing the order last week that Belgium signed up for 20,000 tons, although it is now reported in the market that supplemental orders increased that tonnage to 50,000 of 2-inch billets, and that the price was probably nearer $47 than $43.50, Pittsburgh, as first understood. Deliveries will be made in 1920. Last week the same agency which placed the billet order offered 10,000 tons of pig iron in the export market but the producer withdrew the iron before a sale could be made and sold it in the domestic market. It is said a large Belgian order for freight cars has been placed in Antwerp, but that an inquiry for 10,000 coal cars has been sent to the United States. Business with continental Europe has been far from satisfactory.

British More Optimistic

American exporters fear that the English are displaying considerable optimism over the outlook. The orders which were placed with American producers last summer were startling to the latter but the dropping off since has been so pronounced that the English producers anticipate a complete realignment of international business. The English are reported to contend that America will not be able to hold her export gains once international conditions are restored to normal. Nevertheless the volume of trade today is going ahead in the face of tremendous obstacles, not the smallest of which is the abnormal appreciation of the dollar in foreign countries. Furthermore English exporters continue to turn to the American market with export requirements which they themselves cannot fill. This week an English house purchased 400 tons of relaying rails in the United States for a customer in Manila. A number of houses here have sold small tonnages of miscellaneous supplies to English merchants for customers in South America. South America is still buying her necessary supplies of wire, sheets and bars in this country. While it is still possible to place new wire business, sheets continue to become scarcer and bars are extremely difficult to find. In addition to the heavy South American inquiry for bars in the market, it is learned that England is also sending in inquiries for bars. Last week it was learned that an order for the material for the construction of 50 railroad cars has been placed by Argentine.

South Africa has purchased 1500 reels of barbed wire. A sale of 1500 kegs of wire nails to southern China is noted. The first of the foreign orders based upon a 1920 delivery were received from the Orient. This week a cable was received from Japan confirming an order for six locomotives for that country and Manchuria, which went to the Baldwin Locomotive Works. Japan has purchased upward of 40 locomotives this year from the United States. A Japanese order has also just been received for 300 Ford automobiles, which makes about 2000 such cars sold to that country by one agent this year.

Among other Japanese sales noted in the market this week were 300 tons of tank plates, three orders each for 3000 boxes of tin plate, 200 tons of plain galvanized sheets, a fourth order for 5000 boxes of tin plate, 300 tons of wire, 2500 tons of black sheets, 5000 tons of steel bars, and 20 miles of 12-pound rails. Japanese sales of tin plate made by one house now total approximately 40,000 boxes. The quotations now made on tin plate are much higher than previously.

Japan is now inquiring for approximately 300 tons of mild steel plates. A sale of 500 tons of heavy plates to Japan is noted. Japan is also inquiring for 1400 tons of black sheets and for 3 miles of 12-pound rails. One of the largest Japanese inquiries in the market at present calls for 10,000 kegs of wire nails. An inquiry for 1500 kegs of wire nails drew a quotation of $5.65, base.

Europe's Coal Shortage Serious

Output of Iron Hampered in England, France and Belgium Due to Lack of Coal and Coke—Germans Fail to Supply Fuel as Provided by Armistice—British Prices Further Strengthened by American Advances

Staff Cable

LONDON, Eng., Nov. 17.—British production of pig iron, due to the fuel shortage, is now at the rate of but 575,000 tons monthly. Coal is the most important factor affecting the British and European iron and steel output.

The British output of pig iron in the 10 months ending Oct. 31 was 6,250,000 tons. The monthly average was 625,000 tons, compared with a monthly average of 755,000 in 1918, and 855,000 in 1913. The present deficiency in production is due to the lack of coke.

In the first 10 months of 1919 Germany produced 5,160,000 tons of pig iron. The monthly average was 516,000, compared with a monthly average production of 1,600,000 in 1913.

The British steel output in the past 10 months of this year was approximately 6,775,000. The monthly average, 677,500, compared with a monthly output of 639,000 tons of ingots in 1913. The higher output now is due to wartime steel-plant extensions, which have not been matched by blast furnace construction.

British coal output is somewhat better, the monthly rate now being 21,400,000 tons. Nevertheless, several stacks in the North Yorkshire district are inactive, due to the coke shortage.

The French situation is worse than the British. Thirty stacks in the Roubaix Turcoing district are closed for the lack of coke and ore. Only 10 blast furnaces out of a total of 27 in the Nancy district are active; 33 in the Longwy district, and three out of four in the Briey basin. The Germans are failing miserably to supply fuel as provided by the armistice. German mines supplied France only 17,000 tons of coal and coke in October.

French coal production is hampered by a lack of cars and locomotives, throwing 2000 out of work in St. Etienne. Half a million tons of coal are stalled at French ports.

Lorraine coke is quoted at 105 francs a ton. Belgian and Luxemburg pig iron has advanced 10 francs. All British and European industries face a serious fuel situation this winter.

Bureau of THE IRON TRADE REVIEW,
Prince's Chambers, Corporation Street,
Birmingham, Eng., Oct. 15.

Rate of Exchange 4.16

STRIKES continue to affect the pig iron market. In addition to the molders' strike there is now the strike of bricklayers in Scotland, which has stopped a number of the steel works and thereby reduced demand for pig iron. The molders' strike is increasing in seriousness, and is threatening to stop most of the engineering works. Naturally, there is less demand for foundry iron, but this grade has been scarce for some time and the owners of foundries are disposed to take the opportunity to increase their supplies. The make of foundry iron will fall far short of filling demand this year.

Owing to the comparatively low quality of iron produced, forge iron has become plentiful, and there are reports that concessions can be obtained for Northamptonshire forge iron in the Midlands. There is the same excess of low-grade iron in the Middlesborough district, but there the makers prefer to put the material into stock rather than reduce prices. The market in that district also is strengthened by good foreign demand. Foreign buyers are making the best use of the opening offered to them and are placing their orders. With some improvement in the supply of ships, iron is now being exported in larger quantities.

The molders' strike is seriously affecting the Barrow district, which concentrates on hematites and high-grade iron. Buyers of low phosphorus are placing few orders. There is, however, sufficient confidence in that district to encourage the starting up of furnaces, especially as the output of those in operation is booked to the end of the year. More furnaces have been put in blast in Cumberland, 10 now being in operation. It is expected that two more furnaces at Oldfield will be relighted, but these are employed on ferromanganese. Another furnace may go into commission at Derwent. The situation in that district is adversely affected by the molders' strike, which is holding up a great deal of work at the shipyards.

The market was strengthened somewhat by the news of a further advance in American pig iron. At the same time, there is a possibility of lower prices on forge iron, the sale of which is beginning to lag. The position of the cold-blast furnaces in South Staffordshire continues difficult, as a large proportion of the output goes to the heavy iron foundries which make rolls and other equipment for the large steel and engineering works, all of which are to some extent idle. Unless the Engineering Federation is successful in bringing the strike to a close the iron founders are disposed to take the matter into their own hands, and endeavor to arrive at some understanding with their men. The blast furnaces are maintaining a fair output as far as fuel supplies will permit. Cars are scarce, delaying shipments of coal, and retarding deliveries of pig iron to iron and steel works.

Scarcity of semifinished steel is rapidly bringing the trade to a crisis. Nearly all the finishing mills in the Birmingham district are idle, or nearly so, some having operated for only one or two days a week for several weeks. American strikes which are holding up shipping and preventing the deliveries of good tonnages contracted for, are regarded as a great misfortune. During the summer some very unsatisfactory contracts for American billets were entered. One large works in the Birmingham district bought billets at £12 2s 6d ($50.44), and most of these have yet to be delivered. The buyer states that by special arrangement he will avoid any additional impost through the unfavorable rate of exchange, and if he could get the billets the bargain would be satisfactory, in view of the

fact that no British billets can now be bought under £15 5s ($63.44), ($65.52). The British steelmakers are (65.52). The British steelmakers are in a position practically to impose their own terms.

All foreign importations have been arrested owing to various causes, and the output of small steel bars, which are nearly all made from purchased billets has become absurdly insufficient. One Birmingham merchant this week had seven letters returned to him by one post from mills in different parts of the country to which he replied for small bars, hoops, and other steel products. The same shortage of material places a very serious obstacle in the way of the production of galvanized sheets, orders for which it is impossible to place in the Midlands, as sheetmakers decline all new business. The last quotation for sheets was £35 ($145.60) but in the absence of business this must be taken as a purely nominal figure.

The effect of the American strikes has been to increase the foreign demand for British material of all kinds, especially tin plate. In the Swansea district, the tin plate mills have orders to carry them well into the new year and new orders are pouring in every day for tin plate from South America, South Africa, China, Japan, the Middle East, and various European countries. Recently an inquiry for 200,000 boxes was turned down through the inability of makers to handle the orders although the prices offered were considerably in excess of present rates. South Africa wants 20,000 tons of sheets, Spain and Portugal 50,000 boxes of tin plate, and China 50,000 tons of steel and rails. At present these orders have to be suspended in view of the large commitments of the mills, but a strong effort will be made to handle them early next year.

Only 25 per cent of the Welsh mills can be operated on account of the lack of skilled labor. Prices are very high, 42s 6s ($8.84) being asked for the base box, and it is likely that this will be raised to 45s ($9.36) within the next few weeks. This week 100,000 boxes of tin plate have been shipped to the Far East.

Laborers Return

Amalgamated Association Rounding Up Strikers—More Mills Start

Youngstown, O., Nov. 18.—More employes entered the mills in this district Monday than at any time since the strike began, despite the fact that union organizers urged their followers to congregate at mill entrances to arrest the return movement. The Republic Iron & Steel Co. started another pipe mill at its Haselton plant while six of the eight sheet mills at the Haselton plant of the Sharon Steel Hoop Co. got under way. Every sheet plant in this district has two or more stands of rolls in production and operation in this direction conservatively can be placed at 55 per cent. Reports indicate that 44 open-hearth furnaces are active.

The underlying cause which led certain members of the Amalgamated Association of Iron, Steel and Tin Plate Workers to return to their former positions is interesting. Beneath the surface, these workers did not look with favor upon the general strike movement but were forced out of employment when the unskilled laborers walked out. The various lodges of the association in this and other districts extended permission to unskilled laborers in the steel industry to affiliate, having in mind that they would abide by the association's agreement with the mills.

However, the unskilled laborers broke their faith with the association when they walked out and thereby placed the association in a critical predicament.

The Amalgamated officials realized that if the confidence of many mill managers which it had held in the past was to be retained some action had to be forthcoming immediately. M. F. Tighe, president of the association, was alive to this fact, and ordered the Amalgamated workers to return to work, holding that all agreements between mill owners and the association made before the strike should be held inviolate. Consequently, the only policy left for Amalgamated workers to follow was to round up unskilled laborers and get them back to work.

Operations in Cleveland Steadily Increasing

Cleveland, Nov. 18.—Operating conditions are showing steady improvement. The McKinney Steel Co. is now operating 12 open-hearth furnaces, two blast furnaces, three coke ovens and the finishing mills. The American Steel & Wire Co. and the Otis Steel Co. also report further progress. Although the blast furnace of the Upson Nut Co. is down, the finishing mills are working at capacity. The Cleveland Steel Co. expects to start operations the latter part of the week, sufficient men having returned to work.

Cambria Plants Resume

Pittsburgh, Nov. 18.—A portion of the blast furnace plant of the Cambria Steel Co., and also some coke ovens at Johnstown, Pa., have resumed operation following a vote by strikers taken under the direction of the Citizens league, the same organization which recently escorted William Z. Foster out of town. This is the first attempt to operate the Johnstown plants since Sept. 22, and further resumptions are expected in the near future.

Announce Program

Of Annual Meeting of A. S. M. E.—Will Discuss Unrest

Industrial unrest, the engineering of man power and service of the engineer to the public are topics which will be discussed at the annual meeting of the American Society of Mechanical Engineers, to be held at the Engineering Societies building, 29 West Thirty-ninth street, New York, Dec. 2-5. The following tentative program has been announced:

Tuesday, Dec. 2

Morning: Registration and conference of local section delegates.
Evening: Reception at which presidential address will be delivered.
Election of honorary members.

Wednesday, Dec. 3

Morning: Business meeting with reports of standing and special committee.
Afternoon: Appraisal and valuation session to be held jointly with the American Society of Refrigerating Engineers.
Session on machine design.
Gas power session.
Evening: Commemoration meeting on the work of the DeLamater Iron Works and of John Ericsson.

Thursday, Dec. 4

Morning: Session on the industrial situation.
Afternoon: Power plant session.
Machine shop session.
Session on textile industry.
Evening: Annual reunion and dance, and lecture on the future of aviation by Col. E. A. Deeds, Dayton, Ohio.

Friday, Dec. 5

Morning: Session on transportation.
Final general session.

Among the papers which will be delivered during the meeting are the following: "Lubrication of Ball bearings," by A. H. Blaisdell; "The Hvid Engine and Its Relation to the Fuel Problem," by E. E. Blakely; "Kerosene as a Fuel for High-Speed Engines," by L. F. Seaton; "Wage Payment," by A. L. DeLeeuw; "An Investigation of Strains in the Rolling of Metal," by Alfred Musso; "Modern Electric-Furnace Practice as Related to Foundries in Particular," by W. E. Moore; "Causes of Industrial Unrest; and the Remedy," by Frederick P. Fish; "Profit Sharing," by Ralph E. Heilman; and "Appraisal and Valuation Methods," by David H. Ray.

Reclaiming Precision Tools from High Speed Cutting Scrap Heap

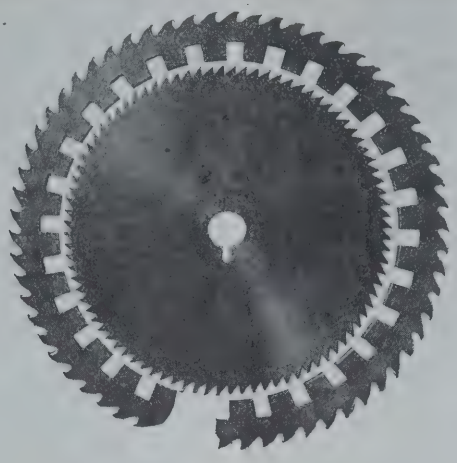

Fig. 1—The 20-inch slitting saw in the center was cut from a 24-inch worn-out cold cutting saw, represented by the outside rim

BY W. H. LLOYD

CONSERVATION still is the urgent need of the day. As practiced during the recent war, it saved the various nations, particularly the United States, millions of dollars, and provided incentives for discovering new methods for economizing. Manufacturers seem to have profited by this wartime experience and now many of them not only seek to purchase material more shrewdly, but endeavor to obtain the greatest possible service from it. More attention is being given to the possibilities of making money by saving it.

In seeking new opportunities in this direction, methods heretofore neglected, have been successfully employed. For instance, many plant executives are discovering that often untapped mines of wealth lie hidden or partially hidden in the box, crib or barrel containing discarded tools. High speed steel, now selling at from $4.50 to $40 per pound, virtually is a semiprecious metal and for this reason the scrapping of worn out cutting tools in most cases becomes an unwarranted extravagance.

In disposing of old tools before the war, many manufacturers followed the line of least resistance. When the blades of a milling cutter or reamer became worn or when a drill end was burned, the defective tools were consigned to a corner of the shop where they remained until a sufficient quantity had accumulated to warrant selling it to a dealer as high speed steel scrap.

Old Tools Are Made Over

Intelligent manufacturers now are having such tools remanufactured. Instead of selling them as scrap or junk at anywhere from $4 to $20 per ton, the tools are remanufactured again and again until there is nothing left upon which to work further. Since high speed steel hardens from the heart out, it naturally follows that when cutting tools are remanufactured they become better the nearer the cutting edge gets to the center providing sufficient strength remains to stand up under usage.

For years many large manufacturers endeavored to maintain their own tool salvage shops but the work of reclamation was carried on in a more or less haphazard fashion. It seemed easier for the machine shop foreman to send a requisition for needed cutting tools to the purchasing agent than it was for him to dig up tools that had been discarded by the machinists, have them inspected to see if they could be salvaged, send them to the tool-salvaging department, line up machines, and take high class machinists from other jobs to reclaim the tools.

Several large shops, notably among automobile manufacturing establishments, have in the past equipped elaborate tool salvaging departments and have endeavored to operate them exclusively as such. This of course was the practice followed only in those shops consuming tools at a sufficiently high rate to permit of a large expenditure for an exclusive department. However, it is stated that this plan never has been proved practical nor profitable. One of the largest automobile manufacturing com-

FIG. 8—BACKING OFF FOR CLEARANCE BACK OF CUTTING TEETH. FIG. 9—GRINDING DRILL ON UNIVERSAL GRINDER. FIG. 10—MILLING DRILL TANGS ON LATHE

panies in the country officially has stated that its tool salvaging department when operated as that alone, was run at a loss and never warranted the huge outlay in time and money. Gradually these tool salvaging departments are being dispensed with and the reclaiming of the tools is being left to experts who have made a close study of the proposition. A few years ago, several companies in the United States recognized that the time was propitious for centralizing such tool reclaiming efforts. They saw the possibilities of developing a business of reclaiming tools. A number of these companies are located in Detroit and while the methods which they employ vary, many of them are highly successful.

Among the first to realize the commercial possibilities of remanufacturing cutting tools, is the Grinding Process Tool Co., 818-820 West Warren avenue, Detroit. As is indicated by its name, the company's process is entirely one of grinding.

About five or six years ago, S. A. Cogsdill who now is president of the company, formed the Detroit Reamer Salvage Co., which in August this year became the Grinding Process Tool Co. In the early days of the tool reclamation business, Mr. Cogsdill, who devoted his entire time to it, drew an average wage of $10 weekly, while W. W. Blakely, who now is secretary and treasurer of the company, but who then gave but a portion of his time to the business, served without compensation. A combined shop and office about 16 feet square was obtained and a second-hand Landis grinder, which weighed about 4 tons, was installed for plain cylindrical grinding. This machine cost the newly formed company about $275 and was paid for at the rate of $25 down and $25 monthly. Later a used cutter grinder, which cost $96, and an old lathe were added.

Manufacturers Were Skeptical

The members of the firm experienced considerable difficulty in introducing their process. Manufacturers were skeptical and loathe to give out their tools, believing that when they did, they would not see them again. Others considered them as scrap and their attitude was: "Well, if they do take them and cannot bring them back, we'll only be out the value of the scrap." After many discouragments the company's president succeeded in prevailing upon a number of manufacturers to trust him with a few reamers. He rushed the tools to the shop, repaired them and as quickly as possible returned them with the request that their performance be checked. The answer invariably was: "Yes, they look all right, perhaps they'll work out all right. Come back in a month and and we'll see if we can give you another order." In the majority of cases, the tools were absorbed into the shop, and their identity lost. Frequently repeat orders were forthcoming, but in other cases manufacturers were not disposed to offer further business.

Finally, however, the Studebaker Corp., which was the first company of size to order its cutting tools remanufactured, commenced to turn its reamers over to the salvage company. The remade tools performed so well in actual tests that the corporation has submitted its worn tools for remanufacture in increasing ratio ever since. Other large manufacturers who have followed the example of the Studebaker company include the Hudson, Packard, Cadillac and Ford motor car companies, the Burroughs Adding Machine Co., Detroit; the Waterloo Gas Engine Co., Waterloo, Iowa; the Curtis Airplane & Motor Co., Buffalo, and a large number of manufacturers in the automotive field.

Plant Has Modern Equipment

The Grinding Process Tool Co. now operates about three dozen machines and all the men who attend them are expert mechanics. This equipment includes several milling machines including one made by the Pratt & Whitney Co., Hartford, Conn; one 12-inch lathe manufactured by the Monarch Machine Tool Co., Sidney, O.; one 14-inch lathe made by the Hendey Machine Co., Torrington, Conn.; a 24-inch drill built by the Cincinnati Bickford Tool Co., Cincinnati; 24 grinders including those made by the Cincinnati Grinder Co., Cincinnati; Brown & Sharpe Mfg. Co., Providence, R. I.; Norton Co., Worcester, Mass.; Wilmarth & Morman, Grand Rapids, Mich.; Persons-Arter Machine Co., Worcester, Mass.; Ott Grinder Co., Indianapolis; Greenfield Machine Co., Greenfield, Mass.; and the Oesterlein Machine Co., Cincinnati; the necessary straightening presses, cut-off saws, etc. Approximately 7500 square feet of floor space now is occupied by the company and the erection of its own building at an early date is contemplated. As indicative of the size to which the business has grown, a shipment was delivered one afternoon recently from the Hudson Motor Car Co., Detroit, which comprised about 7000 reamers of all sizes for remanufacturing.

When first formed, the company reclaimed only reamers, but its facilities gradually have been expanded to take in end mills, milling cutters, drills and finally all sorts of precision cutting tools were included in its remanufacturing program. Now it remanufactures reamers, milling cutters, end mills, drills, slitting saws, counterbores, spot facers, rivet sets, keyseating cutters, hobbs, arbors, plug gages, all types of round broaches except spline broaches, etc.

How Old Tools Are Handled

When shipments reach the company's receiving room the tools are inspected and checked with the customer's list, and discrepancies are noted on the receiving sheet. Specific defects in the tools not mentioned by the customer also are noted.

Thousands of reamers, end mills, milling cutters, etc., with flutes and teeth broken out, are received each month. This necessitates cylindrical grinding as shown in Fig. 4, in which a reamer is being ground on a Brown & Sharpe grinder, to prepare them for the gumming process. This process is illustrated in Fig. 5, which shows a milling cutter receiving new teeth on a special grinder. Both processes are conducted under a cooling solution which is forced from its delivery nozzle under a pressure of 80 pounds per square inch to eliminate the possibility of burning or drawing the temper. Drills, reamers, slitting saws, cut-off saws, milling cutters and end mills are treated in this way.

Large diameter cutting-off saws which have been cracked or whose teeth are broken out, are transformrd into slitting saws. In Fig. 1, in the head piece, is shown the outside rim of a 24-inch cold cutting saw, as removed to form the 20-inch slitting saw shown in the center. This cutting process is illustrated in Fig. 6. After being cut out, blanks are furnished with new teeth and then the slitting saw is redished for clearance. Close attention is paid to this process to prevent gripping. All saws, milling cutters, etc., are checked carefully for clearance and if it is found that the cutting ability of the tool is hampered through lack of clearance, the tool is given the required clearance. The third process for slitting saws takes place on the rotary grinder, illustrated in Fig. 7. After leaving this machine, the saw goes to a dry grinder to be backed off to assure proper clearance back of the cutting edge. All reamers, etc., are carefully treated in this manner by skilled workmen. In Fig. 8, a reamer is being backed off. This is the only

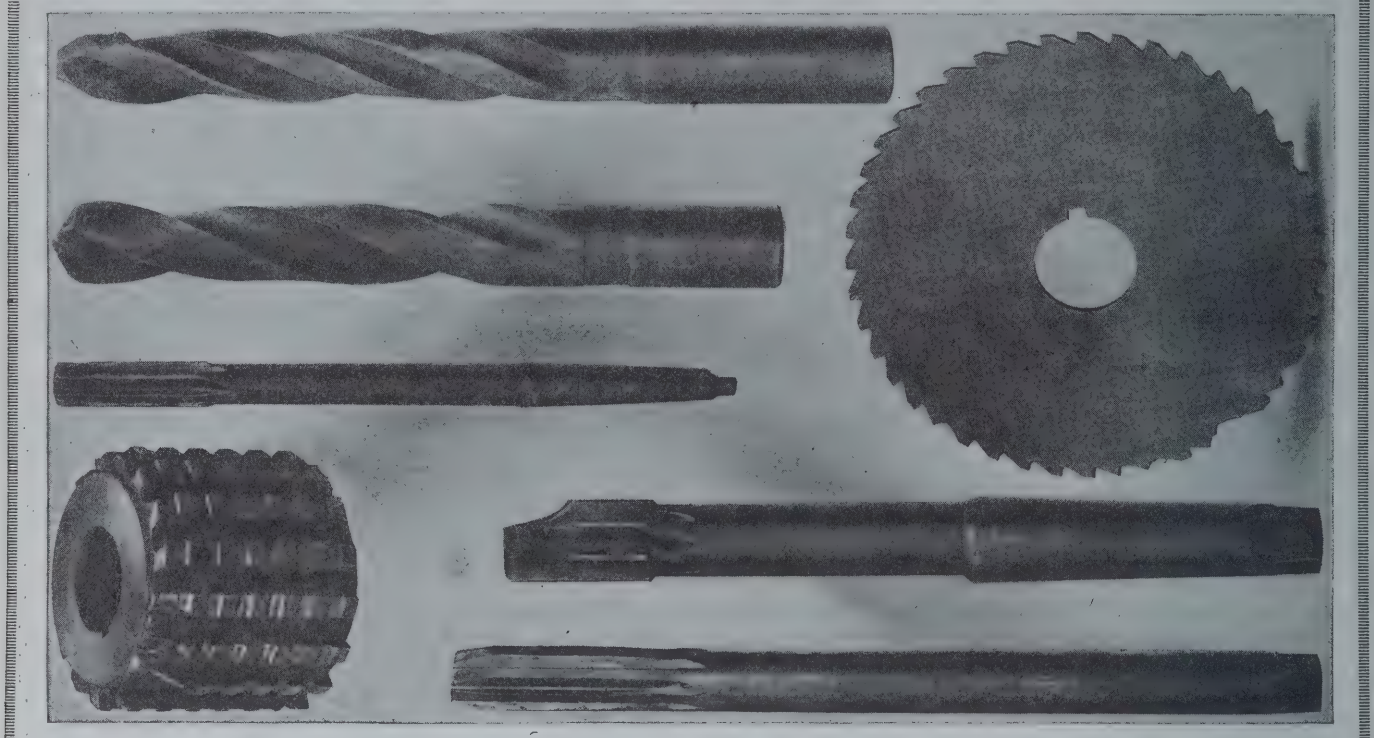

FIG. 11—TWIST DRILLS, SMALL TAPER SHANK MACHINE REAMER, HOB, SAW, TAPER SHANK MACHINE REAMER AND HAND REAMER AS RECEIVED FOR RECLAMATION, BROKEN DOWN AND WORN OUT UNDER USAGE

dry operation in the entire course of remanufacturing and the grinding wheel touches the metal so lightly that there is no possibility of heating the tool sufficiently to draw temper. Tools when finished, ground or polished are revolved between centers under the cooling solution and when they leave the shop no marks whatever are upon them.

The company also manufactures large quantities of cutter blades and also remakes old ones. Obsolete style blades are cut down in size and made into modern blades. These are redished for clearance in a manner similar to that illustrated in Fig. 7. It likewise makes blades for insertion in milling cutters.

Drills over 1½ inches in diameter are more or less special and a greater

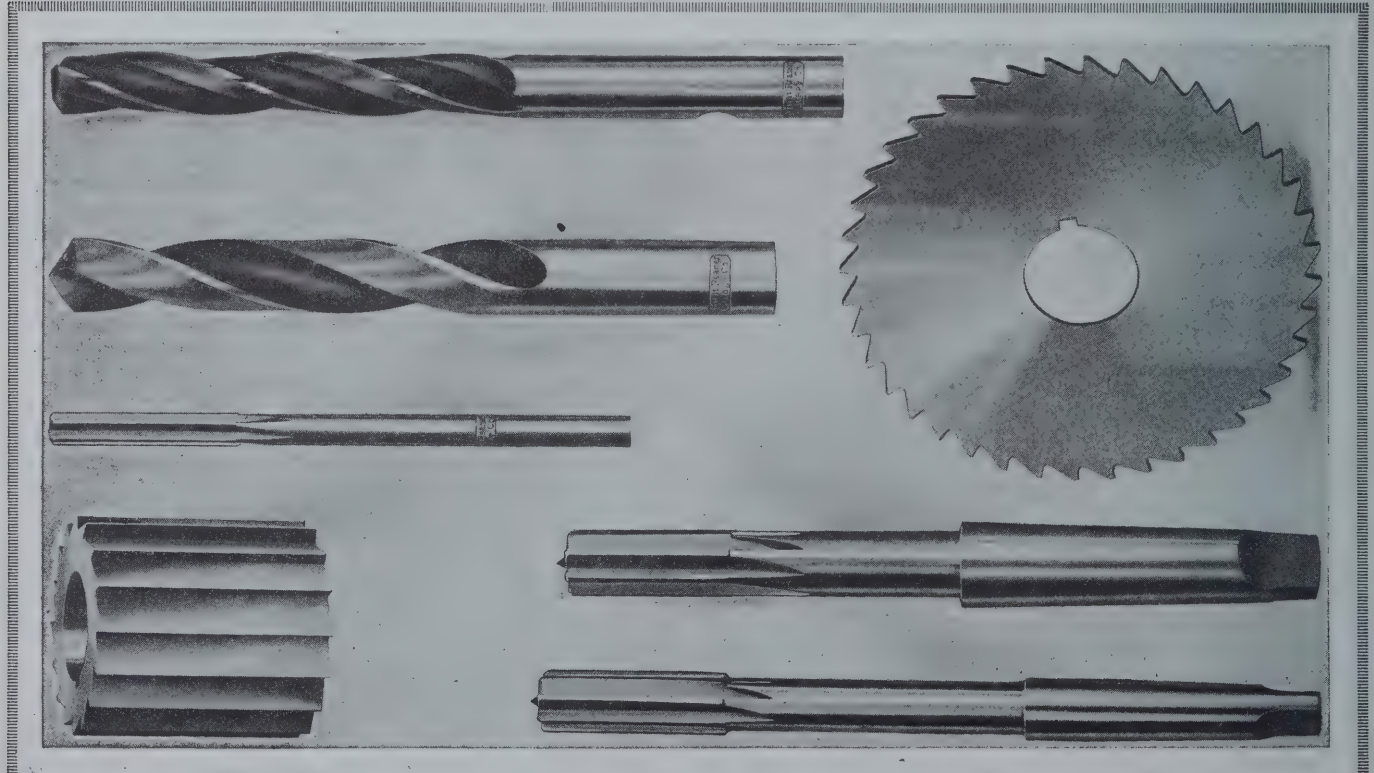

FIG. 12—SAME TOOLS AS SHOWN IN FIG. 11, AFTER HAVING BEEN RECLAIMED AND REMANUFACTURED. SOME TOOLS MERELY ARE REDUCED IN SIZE; OTHERS HAVE BEEN MADE INTO DIFFERENT TYPES OF TOOLS

amount of stock is taken off in the cylindrical grinding operation than from some of the other tools in remanufacturing. This is done to make standard size twist drills to meet the customer's requirements. The grinding operation as shown in Fig. 9, is performed on a universal grinder and is said to greatly improve the drills. Drills often are received for reclamation which are too short for operations requiring a jig or a fixture. In this event the old short shanks are cut off and long shanks of nickel steel are substituted by welding to increase sufficiently the overall length. The new shanks are turned on a 12-inch lathe and then are ground to the taper desired. Tangs for drills, reamers, etc., are milled on a 14-inch engine lathe, as shown in Fig. 10. If the point end of the drill has been burned in usage, it is cut off and a new drill is made of the remaining stock.

New Types From Old

The versatility of the shop thus is demonstrated in many ways. One of the interesting examples of this quality is the manufacture of distinctly different tools from worn out ones. Some slight reference to this already has been made but a few striking examples are shown in Figs. 11 and 12. In the lower left hand corner of Fig. 11, is shown a worn out hob with some teeth broken and others completely gone. This was one of a lot of about 100 hobs sent in; several were made into plain milling cutters as shown in the lower left hand corner of Fig. 12. The remaining hobs were made into shell reamers at about one-third of the price of new tools. As scrap, the old hobbs were worth about 20 cents a pound whereas the new milling cutters each cost from $17 to $18. The small taper shank reamer shown in Fig. 11 was made into the valve stem reamer shown in Fig. 12; the hand reamer became a taper shank machine reamer while the two twist drills and the taper shank machine reamer simply were remade with the necessary reduction in size. The cold cutting saw was made into a slitting saw as explained above.

Sometimes a straight shank hand reamer is made out of a standard chucking reamer and sometimes when a customer requires a 2-size reamer, it is made out of a worn out standard reamer. Great savings thus are being effected. Plain milling cutters which now cost about $12.50 each have been made at a cost of about $2.30 from special gear cutters which have reached the reclamation stage and worth as scrap about 20 cents each. Side mills are made from plain milling cutters. Recently several barrel shaped cutters, 4 17/16 x 10½ inches, having a 75-inch radius, which cost about $250 each when new, were rescued by the Grinding Process Co. from one of its customer's scrap tool boxes. These were taken and completely remanufactured at a saving to the customer of about $200 per cutter. The company bases its charges on a certain percentage of the list prices of the respective new cutting tools, not taking into consideration the advances which recently have been placed in effect by the various manufactures of cutting tools.

Practically the same course through the shop is taken by all tools received for reclamation, the number of operations varying according to their condition. Except when the customer gives the company right of way to use its own judgment in making up new tools which it can use from the worn out tools sent in, an effort is made to follow specifications or blue prints wherever possible.

When a smaller sized reamer is desired, the tang if broken, is cut off and both ends are centered. If bent, the reamer is straightened in a straightening press, the shank is ground down to proper size and the tang is restored. Then it is rough ground on a cylindrical grinder down to 0.01 or 0.015 inch of its proper diameter; the flutes are gummed so that their depth is restored; the reamer is finished ground to accurate size; then it is backed off on a dry grinder, whose wheel barely touches the metal so that it does not get warm or draw temper; the reamer is marked for size, greased and packed worn out tools sent in, an effort is made to follow specifications or blue prints wherever possible.

When a smaller sized reamer is desired, the tang if broken, is cut off and both ends are centered. If bent the reamer is straightened in a straightening press, the shank is ground down to proper size, and the tang is restored. Then it is rough for reshipping, after inspection.

In a legitimate test where the operator did not know whether he was using new or remanufactured reamers, the latter proved to be the best. Six new reamers produced 9000 pieces with 12 sharpenings, whereas the six remanufactured reamers produced 13,000 pieces with five sharpenings.

In a legitimate test where the operator did not know whether he was using new or manufactured reamers, the latter proved to be the best. Six new reamers produced 9000 pieces with 12 sharpenings, whereas the six remanufactured reamers produced 13,000 pieces with five sharpenings.

Contrary to the natural expectation, encouragement is being received from the manufacturers of high speed steel. Instead of reducing the consumption of this commodity, the educative work carried on by the company has tended to increase the use of high speed steel. The greater the number of manufacturers who recognize the economy of having tools remanufactured becomes, the more widespread will the demand for high speed steel tools become. As an example of remanufacturing carbon steel tools, the company takes worn out rivet sets, anneals, re-turns, recaps, hardens and puts them through the finishing grinding process and sends them back as new sets at a cost of about 80 cents as compared with $2.25 the cost of new sets.

Save 50 Per Cent on Tools

In the plants of some of its larger customers, a systematic routine is followed preparatory to shipping tools for reclamation. All tools scrapped in the machine shop go through a central clearing station. This is in charge of a tool supervisor, who is experienced in determining a tool's potential value. All tools are sorted and the tool supervisor exercises his best judgment as to what can and cannot be reclaimed. Possibly the advice of an expert mechanic or a representative of the house which is to do the remanufacturing is solicited as to whether such tools as may already have been requisitioned from the purchasing agent, can be made out of the ostensible scrap. A favorable answer is followed by the issuance of the order to the remanufacturer who receives the specifications as to what tools are required, the scrapped cutting tools and in a short time, the worn out tools take their positions on the machines in the remanufacturer's shop and are metamorphosed into new cutting tools. Many manufacturers are saving not less than 50 per cent of their tool replacement costs. In many instances the saving runs higher.

For the purpose of helping trade relations between the United States and Italy a credit corporation capitalized at $100,000,000, equally divided between American and Italian bankers is being organized. The Italian government will be asked to guarantee returns on the investment of either 5 or 7 per cent and to guarantee credits up to $500,000,000, which the company will be prepared to advance.

Determining Accident Liability

Extent of Damages is Based on Depreciation of Earning Capacity of Workman in His Trade, Regardless of What Wage His Employer May Continue to Pay Him—Some Loss Taken for Granted in All Cases

BY CHESLA C. SHERLOCK

THE whole theory underlying compensation acts is that the workman has suffered a loss of earning capacity due to the industry in which he is engaged, and that the industry ought to share that loss with him. It is in determining just what this depreciation in the earning capacity is that employers meet with the greatest obstacles in applying the compensation acts.

It would seem from first thought that if a workman has suffered no loss of earning capacity by reason of his accident he would not be entitled to compensation, no matter how severe his injury might have been. The legislative authority, however, has taken the liberty to assume, in a given list of cases, that the loss of earning capacity has amounted to a certain per cent of the workman's total capacity, regardless of what the facts in the case might be. These assumed percentages are known as "schedule injuries" and must be paid to the workman so injured, regardless of what the fact of his loss of earning ability may be.

Among these schedule injuries are such as where a finger is lost, an eye, a leg or any specific dismemberment which has been expressly provided for by the statute. If a workman sustains a scheduled injury, the employer must pay the full amount of that scheduled liability whether or not the workman loses a day from work.

It is not in the case of scheduled injuries that the great mistakes are made by employers, for the statutes are sufficiently plain to make it apparent to all that there is no room for argument there. It is in the injuries where no scheduled liability has been made but where, from the nature of the injury, it has been necessary to leave the matter to the settlement of the courts, upon the facts in the case.

Employers naturally assume that since the statutes are silent in this respect that if a workman suffers such an injury, but does not, in fact, suffer any apparent loss of earning capacity, he is not entitled to any compensation. In a Pennsylvania case the court said:

"The standard for the determination of the future earning capacity of an injured employe is whether the power or capacity to earn has been diminished as a result of an injury."

This would then seem to narrow the matter down to the specific question as to whether the fact of lessened earning capacity is to be measured by money return or by some other standard of measurement. It is assumed that the earning capacity to be considered normal, is that of the injured man immediately preceding his injury.

Earning Capacity Less Important

The Illinois court has reminded us that "we cannot be unmindful of the fact that the money value of life and health is appreciating and the earning capacity of money steadily diminishing during these recent years."

As we examine these cases, we find that the courts are giving less attention to the actual money earnings of the injured man and are paying more attention to outside considerations, for they have come to feel that the money earning capacity does not always tell the real story. For that reason employers who have been pinning their faith to the fundamental principles underlying the compensation acts, have been surprised to find the courts compelling them to pay compensation in cases where they honestly were of the opinion that no compensation was due.

In a Kentucky case, a molder's leg was burned by molten metal. The burn was so severe that it prevented him working for more than three months and he was unable to walk upon the leg without the aid of a cane one year after the accident. As soon as he was able to get back to the plant, the employer employed him at his old wages, and jumped to the conclusion that since there had been no loss of earning capacity there was no compensation due the injured man. The court, however, held that this was not conclusive evidence of an absence of impairment of earning capacity.

In a Missouri case it was shown that the plaintiff sustained a severe injury to a foot which made it impossible for him to follow his former occupation. He was skilled in several trades, but the injury was such that it was impossible for him to work at any of them, except at reduced earning capacity.

The employer, however, gave him another position and continued to pay him his former wages, although the evidence inferred that the man was not capable of performing all of the duties of this position, due to the injured foot. In an action for damages he was awarded $6000, the court saying:

"While it appears that he is at present receiving the same salary from his employers as heretofore, the evidence is clear that his ability to serve his employer is diminished, and in the event he should lose his present position, his disability would seriously affect his earning capacity."

This is a point that employers often overlook in attempting to determine whether or not there has been a diminished earning capacity in the case of an injured workman. The true criterion is not the amount of money the workman is receiving in the shop where the accident occurred and which he has continued to receive subsequent to the accident, but it is the actual earning capacity of the man as judged in relation to the whole field of work in which he is skilled. What would he be worth, if placed in the hands of any other employer, who, possibly, would not be moved by sentiment, but would base his pay on actual productive power?

In a Texas case a workman received an injury which prevented him from working for more than six months. When he returned to work his salary was increased, and during the interval that he had not worked his former salary was paid. The increase which he received on returning to work, was not due to any increased earning capacity, but was due to a general increase given all employes in the same kind of employment. In

---

The author, Chesla C. Sherlock, was formerly secretary of the Iowa industrial commission, and is now a practicing lawyer of Des Moines, Iowa.

an action for damages he was awarded $6500 from which judgment the employer appealed.

The court held that the fact that the employer had continued to pay the salary during the time the workman was totally incapacitated, and had increased the wages when the man returned to work did not necessarily overcome the plaintiff's showing that his earning capacity had been diminished.

While it is to be commended in employers, it is not necessary legally for them to continue the full payment of wages to employes incapacitated; the only thing contemplated by the compensation acts is that they shall share the loss according to the percentage of the workman's wage indicated by the state statute. But where the payment is made in full, it will have no effect upon determining whether there has been an actual loss of earning power. In fact, the courts seem to think, if the matter is considered at all, that it is evidence of the employer's attempt to defeat a showing of loss of earning capacity by the workman, rather than a humanitarian attempt to make his injury as inconsequential as possible in his own eyes.

Question Demands Study

The question of loss of earning capacity is one of fact to be determined by all of the circumstances surrounding each case, and it cannot be determined by any one rule. That is why it is impossible for the courts to accept the theory that if there has been no actual loss of earning capacity, as measured in money return, that there has been no impaired capacity.

It is reasonable to suppose, if the condition of the man prior to the accident is to be taken as normal or standard, that any injury sustained subsequent to that time will more or less impair his earning capacity, regardless of whether such impairment is immediately reflected in his wages or not. It is upon this larger basis that the courts are placing their decisions. The man should not, and seldom is, judged according to the treatment he has received at the hands of his individual employer. He is rather considered in the light of his trade or calling and judged as to his value in that trade or calling.

If he is actually impaired in his capacity so that he cannot perform the duties expected of a normal person in the same trade or calling, then he has suffered an impairment of his earning capacity in that trade, regardless of the amount of money he happens to be receiving from his employer.

Employers can well afford to go into this question, for it is the root of all liability under the workmen's compensation acts, at least, as to the extent of such liability.

Character First for Industrial Engineer

IN THE list of essential requirements for an industrial engineer character is first in importance and technique is last, according to the results of an extensive investigation of the subject. In speaking on the subject "College Training for Executives," Joseph W. Roe, secretary, Railway Car Manufacturers' association, gave the Society of Industrial Engineers at its Cleveland conference, Oct. 29, some facts relating to the profession which emphasize the need of college education even for those endowed with character, judgment and knowledge of men. Mr. Roe said:

"The Carnegie foundation at the request of the Society for the Promotion of Engineering Education, the four great engineering societies, and the American Chemical society, undertook an exhaustive study of engineering education. At the first meeting of the joint committee of the societies and the foundation it was felt that before attempting to judge the work of the engineering schools there should be an agreement on the elements needed for success in engineering.

"A series of interviews showed almost immediately that representative engineers and certain large manufacturing companies employing and systematically rating college graduates, were giving much more weight to the proper personal qualities than to technical training; yet the emphasis and attention of the engineering schools were directed almost wholly upon technical training. It seemed desirable therefore to continue the inquiry on the broadest possible basis.

"A circular letter was sent out asking the question: 'What are the most important factors in determining probable success or failure in engineering?' The relative importance of the qualities as derived from the answers received from 1500 engineers is as follows: Character, 41 per cent; judgment, 17.5; efficiency, 14.5; understanding of men, 14; knowledge of fundamentals, 7; technique, 6. These replies were so unexpected and so vital that a second letter was sent out to the 30,000 members of the four engineering societies as follows:

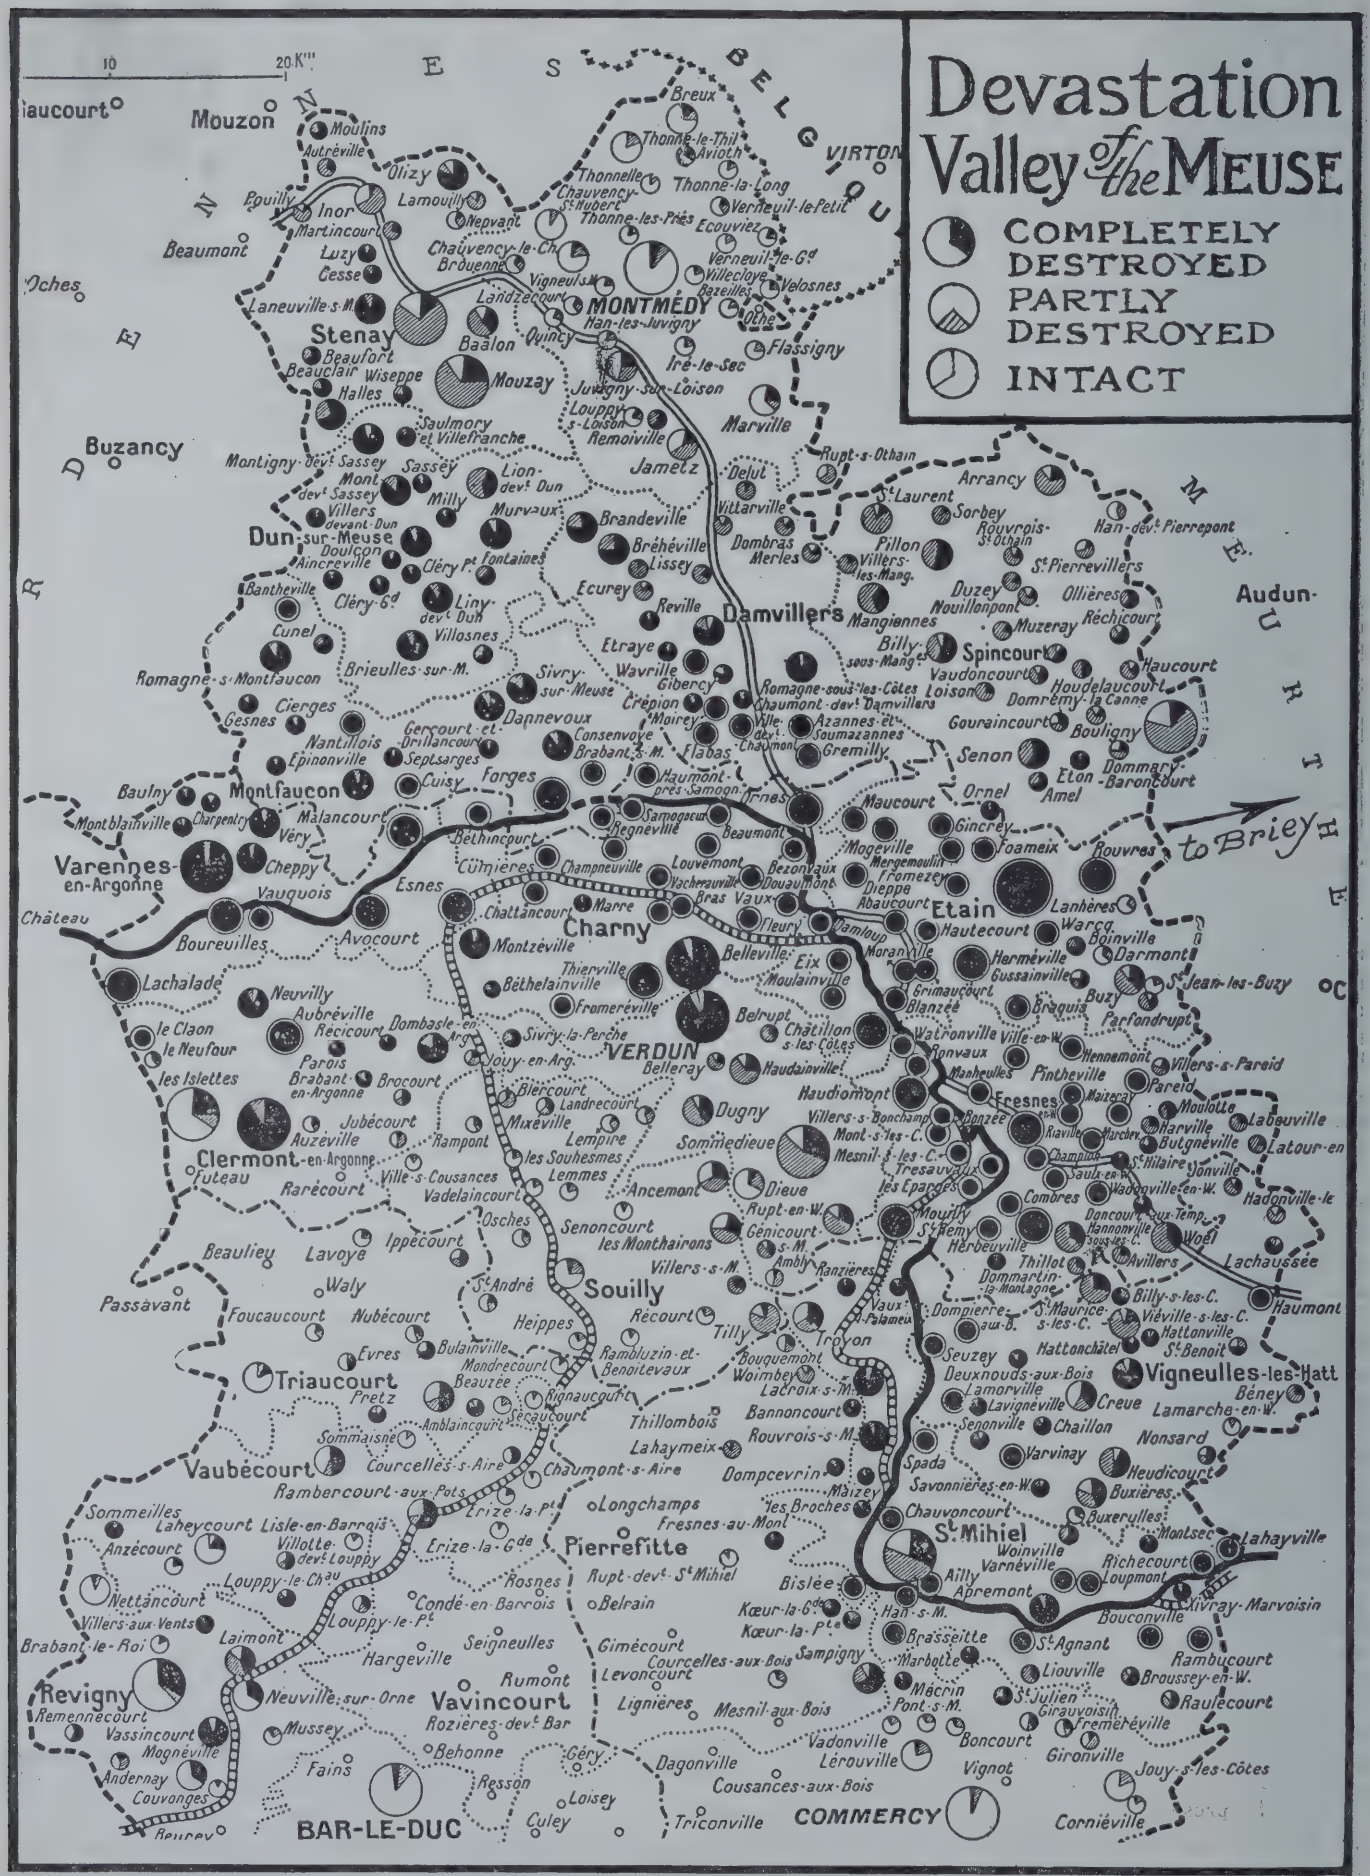
Please prefix numbers to the groups of qualities listed below to show the order of importance that you give them in judging the reasons for engineering success or in sizing up young men for employment or promotion.

Character, integrity, responsibility, resourcefulness, initiative.

Judgment, common sense, scientific attitude, perspective.

Efficiency, thoroughness, accuracy, industry.

Understanding of men, executive ability.



Knowledge of the fundamentals of engineering science.

Technique of practice and of business.

"More than 7000 replies were received. Of these 94½ per cent placed the character group first, and a similar number put knowledge and technique last. The rating of the groups according to the analysis of these replies is as follows: Character, 24 per cent; judgment, 19.5; efficiency, 16.5; understanding of men, 15; knowledge of fundamentals, 15; technique, 10.

"The percentages according to this rating were not quite the same as in the first replies but the order was unchanged. I know of no judgment on this question which can be considered so authoritative. Seldom does a producer have a clearer statement of what the market wants. The colleges as producers must listen to it. Dr. Mann, who made the investigation, has called attention to certain points as follows:

In the first place, *all* the qualities mentioned are essential to genuine success and conscious effort should be made to develop all of them as far as possible. Second, character, initiative, common sense, and qualities of this sort cannot be taught explicitly like multiplication tables and rules of grammar. Third, education is a continuous process of growth, and therefore, the conscious development of the qualities of the first four groups cannot to advantage be arrested for four years, even for the sake of a mastery of knowledge and technique. Fourth, the man whose character, judgment, efficiency and understanding of men has developed most during his college years has the best show after graduation, since these qualities constitute 75 per cent of his equipment. Fifth, the fact that character is rated at 24 per cent does not mean that an engineer can succeed with a 24 per cent character. It does mean that even a perfect character is but 24 per cent of the engineer's total equipment.

FRENCH ENGINEER'S MAP SHOWING EXTENT OF DESTRUCTION OF INDUSTRIAL PLANTS IN THE VALLEY OF THE MEUSE

Germany Restoring Factory Loot

Trainloads of Machine Tools Now Rolling Back to France—Twenty Thousand Tons of Cranes Were Stolen From Northern Part of Country—German Production of Iron and Steel Growing

BY FRANCIS MILTOUN
French Correspondent of The Iron Trade Review

TWO official reports embodying documents of considerable economic importance have just been issued by the French minister of industrial reconstruction. The real meaning of them is elucidated by the accompany map of the Meuse valley in northeastern France, showing the extent of the destruction of industrial plants.

The first of the official communications deals with the recovery by the Wiesbaden commission of machinery and tools stolen from northern France and transported to Germany. Train loads of identified machinery are being sent back monthly. The tonnage thus recovered is as follows:

	Car loads	Tons
March, 1919	81	1,085
April	334	3,270
May	487	5,224
June	788	9,211
July	...	10,000

The other document establishes the fact that 20,000 tons of cranes were stolen from steel and iron plants in northern France. The work of recovery has just begun. Doubtless all of the cranes will not be found, and doubtless Germany will avoid paying for a considerable number of them. But certain it is that France will have to scrape the world markets closely for replacements. Replacements are only to be had at from twice to three times the cost of the equipment before the war. Government aid is being extended manufacturers only on the basis of prewar inventories.

The inventory of the loot as compiled by the ministry of industrial reconstruction divides all industries into three classes: Big industries, employing more than 1000; average industries, employing more than 200 and less than 1000; and small industries, employing less than 200. The figures were obtained by the various committees which were appointed by the government to estimate the damages resulting from the invasion. They were obtained only from industries which could definitely establish inventories of their losses. They were compiled under the supervision of the president of the commission, Monsieur L. Le Chatelier, president of the corporative committee of the Metal and Electrical Industries of the Central association. They do not include the mining industry and its losses. Following is the inventory:

Machinery and equipment	Big industries	Average industries	Small industries
Boilers, in square meters of heating surface	15,000	50,000	30,000
Steam engines, horsepower	30,000	55,000	30,000
Motors and dynamos, horsepower	45,000	145,000	10,000
Transformers, horsepower	30,000	80,000	10,000
Gas containers	1,000	300	300
Machine tools for metal working and cutting	6,500	10,500	22,500
Machine tools for metal modeling, etc.	1,400	600	5,600
Machine tools for wood working	200	500	3,300
Cranes and windlasses	800	700	1,500
Turntables, etc., tons	2,000	12,000	6,000
Scales and balances	1,500	3,000	2,000
Locomotives, standard	50	.....	....
Freight cars, standard	800	200	....
Freight cars, narrow gage	500	1,500	2,000

The Association of German Iron and Steel Producers reports that in April, 1919, 435,242 tons of pig iron were produced in Germany, and in May, 524,986 tons. Production in May was divided as follows: Hematite, 48,582 tons; foundry iron, 88,178; bessemer, 3425; basic, 248,633; iron for forging, 8998; ferromanganese and similar grades, 127,175.

Steel production in May amounted to 598,377 tons, as compared with 426,910 in April, and was divided as follows: Bessemer, basic, 240,963 tons; bessemer, acid, 6526; martin, basic, 316,600; martin, acid, 5048; cast steel, basic, 14,007; cast steel, acid, 7979; crucible steel, 2916; electric steel, 4338.

Rolling mill production was as follows: April, 365,437 tons; May, 507,963.

* * *

France produced annually before the war approximately 35,000 tons of tin plate, imported 20,000 tons and exported 2300 tons. Home consumption thus accounted for 53,000 tons.

According to a recent report of the French minister of commerce, production in France in 1915 amounted to 2500 tons, and imports, 68,340. Production in 1917 was practically nil, and importations, owing to the restrictions by the British government, amounted to only 45,329 tons, whereas in 1916 they amounted to 80,708 tons. Interdiction of export from Great Britain was abolished by an Anglo-Franco accord, but there was but one single purchaser for Welsh tin plate, the state.

The figures for 1918 are as follows: French imports, 58,209 tons, of which 46,809 tons were received from Great Britain. French exports in 1916 amounted to 1180 tons; in 1917, 727, and in 1918, 745.

Production of tin plate in France is decreasing, and the remodelling of the customs tariff is considered the only possible means of reviving the industry.

Germany has seen its production of tin plate grow steadily in recent years. In 1912 it had reached a tonnage of 72,000, whereas in 1900 it was but 40,500. Production in 1913 was 89,000 tons, in 1914, 85,569 tons, and in 1916, 92,701. Germany absorbed, including importations, 120,000 tons in 1912. A German syndicate of tin plate makers existed before the war, but was dissolved in 1914, though efforts were made in 1917 to reorganize it, or form another.

Italy in recent years has made considerable progress in tin plate production. On the eve of hostilities production was in the neighborhood of 30,000 tons. As her home needs were 50,000 tons imports amounted to 20,000 tons.

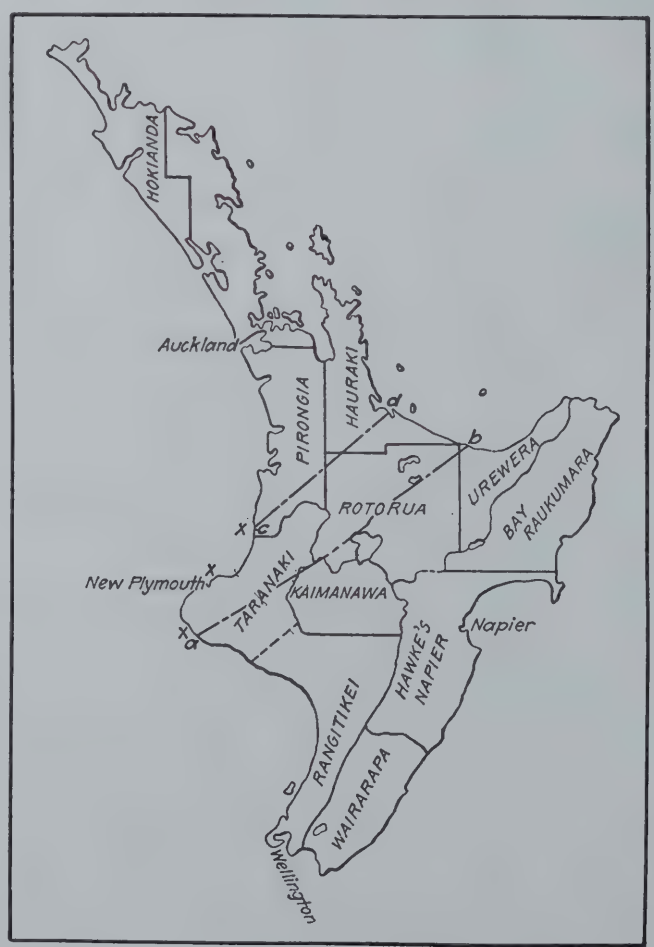
* * *

A report has come to Paris from the Vienna bourse concerning the famous Skoda armament works, which made the big siege guns, first used against the forts of Liege in Belgium. An offer is said to have been made to Herr Karl Skoda by the Prague government for the purchase of 70,000 shares of the company. It is said that the Tcheko Slav government is working in connection with the Creusot works in mid-France. Again there is a rumor that American capital is going in. The former Austrian government, through its ministry of war, still owes the Skoda company 150,000,000 crowns for guns and ammunition delivered during the war.

Announcement has been made to the effect that the eleventh annual meeting of the American Institute of Chemical Engineers will be held in Savannah, Ga., Dec. 3 to 6. An elaborate program is now being prepared. J. C. Olsen is secretary of the organization.

Smelting Titanium-Bearing Ores

Iron Sands Deposited Along the Shores of New Zealand Present Difficult Problems When Utilized in Blast Furnace—How Sands Were Treated for the Production of Pig Iron



BY V. W. AUBEL

AMONG the iron-bearing ores of the world, the titaniferous iron sands of New Zealand are probably the least known to American engineers. This is not surprising in view of the fact that American ironmasters look with disfavor on any, even domestic ores, containing over 1 per cent titanium. The possibilities of smelting titanium-bearing ores in the blast furnace are still undetermined, but the problem of their efficient reduction is becoming more important each year. New Zealand has, however, been intensely interested in her deposits of titanium-bearing iron sand, and during the last 50 years considerable English and New Zealand capital has been expended on this problem. The extent of the New Zealand iron-sand deposits is almost beyond measure. From Patea north to Manuka Heads, along almost the entire west coast of the north island, these deposits exist. Wherever there is beach sand along this 300 miles of coast line, the sand is iron bearing. It varies considerably in grade; but wherever the contour of the coast affords small bays and inlets, large dunes are found that are remarkably uniform in quality. Several of these large deposits, especially those at New Plymouth and Patea, are noted for their high iron content. The dune at New Plymouth runs between 55 and 60 per cent of metallic iron; the panning action of the prevailing westerly winds and northwesterly currents has no doubt resulted in this concentration. Whatever the origin of this material may be, there is no doubt that deposition is going on continuously. At New Plymouth, a small artificial harbor, protected from the drifting sand by a large breakwall, has been dredged. Here sailing vessels have for years been loaded with iron sand for ballast by means of a crane and grab bucket operated from the wall of the breakwater. Thousands of tons of sand have been removed from this spot yet each succeeding storm renews the supply. The sand dune shown in Fig. 1 has been tested to a depth of 50 feet without losing its high quality. The beach itself is of high iron content at a depth of 30 feet.

Sand is Easily Accessible

The origin of this ore is generally accepted as being subterranean and volcanic. The New Plymouth district is, however, the western extremity of a volcanic belt, that extends across the North Island, the eastern end is the well-known active thermal region of Rotorua. New Plymouth is well connected by rail with both Wellington and Auckland and its deposit of sand is easily accessible by both rail and water.

About 1868, a small blast furnace was built at New Plymouth and the iron sand, mixed with clay and baked into bricks, was charged into the furnace with charcoal as the fuel. This test was evidently not successful. The next attempt of any magnitude, and the one perhaps that deserves the most mention, was made at Onehunga about 1884. Considerable interest was being aroused at this time in England over the possibilities of iron sand. As Canada and New Zealand were both rich in this mineral, the matter was brought to the attention of the foremost steel and iron men of that day. Sir William Sieman, just before he died in 1883, developed a combination balling furnace and open-hearth furnace which was to be used to treat the Canadian iron sand. Sir Henry Bessemer also became interested and carried out some laboratory experiments. Between 1887 and 1912 a great many companies were formed for the exploiting of these sands. Some of these made honest efforts to utilize the iron sand, while others were of a distinctly wildcat nature. The operations of some of these wildcat companies have caused considerable prejudice against this material both in England and New Zealand. In 1914, a company was formed for treating the iron sand for the production of pig iron by a process patented in New Zealand. The sand from the beach was dried, put through a magnetic separator, mixed with a large proportion of fine coal, and coked in fireclay retorts.

MAP OF NORTH ISLAND OF NEW ZEALAND

The active volcanic region of the island lies between the lines *AB* and *CD*. The principal deposits are at places marked *X*. The trend of the currents on this coast has scattered this sand in large quantities practically all the way to Auckland.

Abstract of a paper presented at the annual meeting of the American Institute of Mining and Metallurgical Engineers, Chicago, Sept. 22 to 26. The author, V. W. Aubel, is assistant blast-furnace superintendent, Clairton works, Carnegie Steel Co.

The product from the retorts, termed ferrocoke, was smelted in a large cupola with a little limestone for flux but without the addition of any extra fuel. The amount of fixed carbon in the ferrocoke was to be kept great enough to supply sufficient heat and carbon for the reduction of the already partly deoxidized iron sand. This process was tried out in a variety of ways for nearly three years but the iron produced was inferior. Such a process has little to recommend it from a metallurgical point of view and it is not surprising that it was abandoned. The scarcity of pig iron in New Zealand and the resulting high price due to the war, encouraged another attempt to use these sands. Late in 1917, it was decided to build a small hand-filled blast furnace, equip it with hot blast, and experiment still further.

The utilization of such an ore of iron as this titaniferous iron sand for the production of pig iron in the blast furnace, presents two very difficult problems. The first is the physical condition of the ore; being in the form of fine beach sand, there is obviously the necessity of briqueting, sintering, or otherwise preparing the sand for charging into the furnace. The second is the necessity of either eliminating the titanium content of the sand wholly or in part by magnetic separation milling methods, or attempting to slag it off without interfering with the continuous operation of the furnace or the production of a marketable iron.

A sample was taken from that part of the beach which constituted the ore supply for the furnace and was used also when testing the sand with the magnetic separator for the elimination of the titanium.

AVERAGE ANALYSIS OF SAND FROM NEW PLYMOUTH DEPOSITS

	Per cent
Metallic iron	56.22
SiO_2	6.20
Al_2O_3	2.00
CaO	0.62
MgO	2.80
TiO_2	10.30
P_2O_5	0.74
V_2O_5	0.39

Experiments were conducted on a large scale with the magnetic separator, which was part of the original equipment. This machine consisted of two pairs of rolls operating between two pairs of fixed magnets. The sand was fed and distributed to the rolls in a uniform stream by a revolving feeder. The magnets were excited by a small generator, driven by the motor that operated the rest of the machine. They could be adjusted both as to strength of current and as to length of magnetic field. The dry sand dropping from the rolls in a uniform sheet was deflected on either side by the magnets; the tailings, or nonmagnetic material, dropped onto a conveyor belt and discharged outside of the building. The magnets were excited and adjusted from a weak magnetic field to a strong magnetic field, with no appreciable lowering of the titanic-acid content of the concentrates. Not even with a weak field and the consequent loss of iron in the tailings did the titanic acid in the concentrates drop under 9 per cent. In this respect the New Zealand sands differ materially from the St. Lawrence river iron sands of Canada. These latter, although they are of considerably lower grade, lend themselves easily to wet magnetic concentration with a product containing from 65 to 70 per cent of metallic iron and only 2 to 3 per cent of titanic acid.

Results of Tests Made with Cast Iron Bars

Test Specimen	Deflection Inch	Pounds to Break	Remarks
1 PSS*		2900	Flaw in casting at breaking point.
2 PSS	0.5	3250	Small flaw in casting.
3 PSS	0.5	3530	Bar not broken.
1 P	0.5	3400	Broke at small flaw.
2 P	0.5	3500	No break.
3 P		3550	No break.
1 M		3550	No break.
2 M		3550	No break.
3 M		3550	No break.

*PSS indicates proportion of two parts of good machinery scrap to one part of pig iron; P indicates all pig iron, M indicates three parts of pig and one part of scrap.

Treatment of Sand

In the first experiments with a roll-type of egg briquetting machine, the attempt was made to use the raw sand from the beach mixed with 12 per cent of ground coal. The pressure exerted by the rolls, however, was not sufficient to bind this material and the proportion of good eggettes was probably not over 50 per cent. An effort was then made to grind the coal and the sand together; this gave a much better yield of good eggs and led to the purchase of a 33-inch grinding mill.

The treatment of the sand finally adopted was as follows: The sand was loaded from the beach into small side-tipping narrow-gage trucks; fed by bucket elevator into a rotary coal-fired kiln and discharged by a screw conveyor; elevated by bucket chain and fed to the distributor of the magnetic separator; the dried concentrated sand was mixed with 12 per cent, by weight, of low-sulphur coal, elevated and fed to a disintegrator, and discharged into a storage bin; fed from bin by a screw conveyor feed to the mill, all the product from the mill passed through a 100-mesh sieve; discharged from mill, slightly dampened with water, into an enclosed mixing conveyor and elevated by bucket belt to storage bin. From the bin the material was fed by a roller feeder to a vertical pug mill acting as a mixer and feeder to the eggette machine; eggettes were discharged over shaking screen onto a conveyor belt running to feeding platform of roasting furnace then hand-fed into blast roasting furnace, automatically discharged over screen, and stored for smelting in the blast furnace.

The blast-furnace plant, as completed, consisted of a small furnace of about 15 tons daily capacity, a 24-pipe hot-blast stove, and a 24-inch smelter blower. The blower was either direct driven by a 70 horsepower vertical steam engine or belt driven by a 75 horsepower motor. The furnace was 46 feet high, 4 feet diameter at the hearth, and 9 feet diameter at the bosh. The bosh was spray cooled and pierced for six 3-inch tuyeres; the tuyere coolers were of cast iron with coiled cooling pipes. Several cast iron cooling boxes were inserted in the tuyere area. The furnace shell was of ½-inch plate stiffened by rails bolted on the inside. The top was closed by the usual cone and bell, with a 24-inch bleeder leading off the downcomer. Two burners led the gas to the combustion chamber of the hot-blast stove. This stove was 40 feet long, 10 feet wide, and 14 feet high. Twenty-four 10-inch diameter U-pipes were suspended in three rows of eight each. The walls were lined with firebrick and insulated with a 3-inch layer of granular pumice. All the units of the plant were electrically driven except the blower.

The analyses of the ore used, the coke, which we obtained locally, and the limestone are as follows:

	Eggettes Per cent	Limestone Per cent
Iron	50.0	....
CaO	2.8	54.1
Al_2O_3	1.8	0.9
TiO_2	9.2	....
SiO_2	5.7	4.0
MgO	2.0	3.17
C	10.0	....

Westport Coke

	Per cent
Fixed carbon	93.55
Volatile hydr.	1.85
Water	0.25
Ash	4.35
Ash includes sulphur and phosphorus	0.85 0.035

It is at once seen that, excluding the titanic acid, the amount of slag-

forming ingredients is small, and it would be extremely hazardous to attempt a run without diluting this titanic-acid content to some extent by the addition of some foreign slag-forming materials. This material was found in a local volcanic rock, which it was thought would furnish the necessary ingredients to make those complex silicotitanates of lime and alumina considered necessary to flux away any great quantities of titanium. This rock also contained a considerable amount of alkalies, which are well known to form easily fusible compounds with titanic acid. An analysis of the rock as used is:

SILICEOUS ROCK

	Per cent
SiO_2	53.3
Al_2O_3	20.4
CaO	8.1
MgO	0.36
Mn	0.86
Alkalies	6.6
Fe_2O_3	8.1

This test run was not so much a question of production or cost as an attempt to secure some practical data. Naturally, under such conditions, the furnace operator would keep a high slag volume per ton of pig, and also a low burden of ore per ton of coke. Starting off in this way with titanium low in the slag and working up to a normal burden, and then working down on the slag volume, with a consequent rise of titanium in the slag, until the point of economic balance had been reached, would, of course, mean running over a considerable length of time to obtain satisfactory results. The furnace was filled to start as follows:

Four charges coke, 1500 lb. each.
Five charges, each { coke, 1500 lb. / limestone, 636 lb. / silica rock, 600 lb.
Three charges, each { coke, 1500 lb. / limestone, 730 lb. / silica rock, 700 lb.
Two charges, each { coke, 1500 lb. / ore, 500 lb. / limestone, 810 lb. / silica rock, 700 lb.
Three charges, each { coke, 1500 lb. / ore, 800 lb. / limestone, 760 lb. / silica rock, 600 lb.

Starting with these charges on a coke unit of 1500 pounds, the ore was gradually increased to 2000 pounds and the amount of the silica rock and limestone was gradually decreased in order to bring up the percentage of titanic acid in the slag. The first day the speed of the blower was brought up to a maximum of 60 revolutions, which gave an average blast pressure of 20 ounces at the blower and about 14 ounces at the furnace. The average blast temperature was controlled at approximately 1000 degrees by regulating the supply of gas to the stove. The furnace was cast and flushed regularly the first five days. The first slag was essentially a silica-lime slag, as only what titanium contained in the silica rock was present. All the slags obtained through the cinder notch from the beginning to the end of the run were extremely fluid, more so than the average blast-furnace slag.

On the fifth day, one of the tuyeres was burned and before the trouble was located, due to the high-water pressure and relatively low-blast pressure, the furnace had secured considerable water. On the cast succeeding the changing of this tuyere difficulty was experienced in getting the tapping hole open; the remaining five days of the run the furnace seemed to be getting steadily worse in this respect. It was often necessary to burn the tap hole open with oxygen, and the hearth bottom seemed to be getting higher each day. During this time the cinder obtained through the cinder notch was hot, gray, and very fluid, while the slag obtained through the tap hole at the end of the cast showed none of these very desirable characteristics. The tap-hole cinder seemed to be darker, heavier, and to have a tough sticky nature.

Hard Iron Notch Encountered

Analysis of this material is given with that of the other data obtained from this run. On the last two days of the run, considerable iron was tapped through the cinder notch. Outside of the hard tap hole, iron at the cinder notch, and building up of the hearth bottom, there were none of the indications of a bunged up furnace. The iron was hot and gray and the cinder was hot and fluid. On the seventh or eighth day of the run, the brickwork around the tuyere zone on one side of the furnace began to steam and moisture oozed out around the joints in the brickwork. The coil-cooled cast iron cooling blocks were suspected of leaking so the water was shut off of these. On account of the bunged up condition of the furnace and suspicion of water leaking, it was decided to "blow out" on the tenth day.

The furnace had made about 90 tons of iron. Some of the analyses are given. Test bars were made from some of this pig and tested with the results given in the accompanying table. On cleaning out the furnace, it was found that the hearth had built up about 2 feet from its former level; the analysis of the salamander is given. One of the tuyere coolers was found to be leaking and the furnace no doubt obtained considerable water from this source and also from the blocks. From this test we had wished to observe the quality of the iron obtained, the nature of the slag in relation to its titanium content, and to obtain evidence to either prove or disprove the contention that titanium segregated in the furnace hearth. Due to the water trouble encountered, the data obtained from this run could not be considered conclusive, so it was decided to have another test of at least a week's duration.

The following analyses were made by the New Zealand Government Dominion laboratory.

REPRESENTATIVE ANALYSES OF IRON OBTAINED ON THE FIRST RUN

	First Cast Per cent	Fourth day Per cent	Seventh day Per cent	Ninth day Per cent
Silicon	8.18	1.63	1.49	1.60
Titanium	0.98	1.69	0.39	0.45
Phosphorus	0.73	0.45	0.56	0.57
Vanadium	0.11	0.03		
Sulphur	0.007	0.030	0.080	0.090
Manganese	0.28	0.31	0.44	0.38
C C	1.53	1.34	1.15	1.14
G C	2.04	2.07	2.80	2.79

REPRESENTATIVE ANALYSES OF SLAGS OBTAINED ON THE FIRST RUN

	First slag Per cent	Slag Third day Per cent	Slag Sixth day Per cent
SiO_2	43.00	32.40	31.29
Al_2O_3	20.00	15.17	13.90
Fe_2O_3	.....	1.15	2.73
CaO	32.60	35.80	37.97
MgO	.....	6.36	6.28
TiO_2	.....	7.09	7.72
Alkalies	.....	2.03	.....

Without considering the effect of any water that, no doubt, had leaked into the furnace both through the leaking tuyere cooler and through several cracked plate coolers, it is at once seen both from the operation of the furnace and from the analyses of the slags and the material found built up in the hearth bottom, that all of the titanium in the charges was not finding its way out of the furnace.

In preparing the furnace for the second run, every possible care was taken to avoid any repetition of the previous water trouble. The bronze tuyeres were made heavier in construction and given a larger water feed at a lower pressure. The cast-iron coil cooled blocks were dispensed with entirely, under the theory that no cooling would be necessary in the tuyere area for such a short run. New and better tuyere coolers were provided. The second run lasted 11 days, but there was no trouble from water leaking into the furnace. At the completion of the run all, the cooling bronze was as sound as at the start.

The furnace was filled to start in the same way as for the first run. With a coke unit of 1000 pounds, the ore charge was gradually increased to 1800 pounds, limestone to 448 pounds, and silica rock to 270 pounds. The furnace was flushed and cast regular-

ly, no trouble being experienced until the fifth day. During the first five days, the iron at no time ran under 2.50 per cent silicon. On the fifth day some trouble was experienced in getting the tap hole open; on this cast it was impossible to get any slag to follow the iron. The next cast was small, and from then on all slag and iron were tapped together out of the cinder notch. About the eighth day, a hole was cut above the tap hole at the same level as the slag notch and from this hole all the slag and iron were tapped together at regular intervals until the end of the run. No further building up of the hearth occurred; if anything the hole was lowered to some extent by this method of tapping. On the fifth day, when the trouble was first experienced with the tap hole, the iron obtained was white; no change was made in the furnace burden from that indicated above. White iron was obtained on the sixth, seventh, and eighth days but after the tap hole was cut in the front of the furnace, the iron turned gray and the silicon content jumped at once to over 2 per cent. Good, gray iron was the rule from this time until the end of the run.

From our experience with these two runs we have drawn a few conclusions that may be of interest. The difference between the slag obtained from the cinder notch and that obtained from the tap hole at the end of the cast was emphasized before. This difference was marked on the second run. After the cinder notch was abandoned on the second test, and all the slag and iron were run out together from the improvised tap hole, a large sample of the slag was taken in a mold and allowed to cool. On breaking this sample a distinct line of demarkation was shown between two formations. The bottom layer had a specific gravity of 3.8 and the top layer a specific gravity of 3.2. The bottom layer was of a much deeper blue color than the top, and showed plainly the presence of more titanium. From this it would appear that when flushing slag out of the furnace through the cinder notch, that we are obtaining slag with the low specific gravity and segregating the titanium in the hearth. This would account for the vast difference in the appearance of the slag from the cast and that from the flush. It would also appear that when all the slag and iron are taken at regular periods from the same tap hole that a greater percentage of the titanium is eliminated.

On the ninth day of the second run the supply of prepared eggettes was exhausted. It was, therefore, decided to try a few days' operation with the raw beach sand in place of the prepared material. The raw sand was wetted down with a 5 per cent solution of clay wash, just sufficient to prevent filtration and also to prevent excessive loss in the dust catcher. The coke, sand, limestone, and silica rock were thoroughly mixed before charging into the furnace. Practically the same weights were used as when using the prepared material. This practice was followed for the two remaining days of the run, or until the stock of coke was exhausted. No difference was noticed in the workings of the furnace. The iron obtained was high in silicon, averaging about 2.40 per cent. It is unfortunate that we were unable to obtain sufficient coke to keep on with this second run. It was the consensus of opinion, however, from those in charge that it would have been no trouble whatever to have run the furnace indefinitely. Further efforts along these lines are to be made to utilize this material, and preparations are under way for a more extended trial of the furnace. When further trials are completed more information may be available.

Urges Standardization in Industry

Charles LeMaistre, secretary of the British engineering standards, at a dinner recently given in his honor by the recently organized American engineering standards committee, expressed the opinion that one of the strongest ties which can bind two or more nations together is engineering and industrial standardization. Mr. LeMaistre described the work and organization of the British association, which he said was formed in 1901 at the instance of Sir John Wolfe Barry, through whose able guidance during some 16 years of the most important period of its existence the association gradually gained the confidence of the people. It now is an organization of some 300 committees and 1200 members who give their time fully to

Observe Safety Week at River Rouge

DURING safety week at the blast furnace plant now under construction for the Ford Motor Co. at River Rouge, Mich., the banner in the accompanying illustration was one of a number used to promote safety among the employes. The number of accidents in each department were posted on the banners each day, this proving an effective aid to accident prevention. A campaign for prevention of accidents, especially in plants under construction, was undertaken by the Ford company because of its belief that safety education is the principal medium for reducing accidents. It is stated that the workmen displayed considerable interest in the banners and made a special effort to keep their particular departments free from accidents.

the work of the British association.

"Much of the work of our committee," Mr. LeMaistre said, "is done in London and many of them meet in the centers where the particular standard under discussion is manufactured. This assures at the outset that those people who are going to use the standards and who are in daily contact with the apparatus involved, and who have the closest knowledge of the details shall put up the first proposals. This is not what we used to do but we realize more and more that standardization is, shall I say, 15 per cent technical and 85 per cent human. Standardization is an industrial matter and it is the industry that should put up the standards and get the help of the engineers and experts to support them.

"We agree that standardization means efficient production. It can only be effective when overlapping is avoided. Overlapping can only be obviated by the operation of some central organization, which we have provided in Great Britain with wonderful effect. We find now that overlapping of effort is becoming less and less each year and the British engineering standards association is becoming more and more recognized as the central authority for drawing up standards for the engineering and allied industries.

"During the last year or two I have received at my office numbers of letters from America inviting co-operation and I have always been in some difficulty to know how to reply. Take for instance the electrical industry which has in this country at least a dozen organizations doing standardizing work. A request from one of these could not be accepted as from all. My association feels that, at the present important stage of the development of the work and of the closer relationship with the United States, if only we could get co-ordination of standardization on both sides of the water, one central authority on each side, it would not only help our industries enormously, but we could work hand in hand on these technical problems which involve this complicated human factor. And in doing this big work we would surely be no mean influence in promoting the peace of the world."

Mr. LeMaistre's address evoked responses from the officers of numerous American engineering and scientific societies, who expressed their willingness and that of their organizations to centralize the work of standardization in the new American engineering standards committee.

Install Operatorless Freight Elevators

AMONG the interesting features of the government's new army receiving and distributing base at Brooklyn, N. Y., is the equipment installed for transporting material horizontally and vertically in the warehouses. That the problem of transportation is complex is readily apparent when it is understood that the warehouses, yards and docks cover about 100 acres of ground, accommodate 1300 freight cars and 12 ocean freighters simultaneously and are equipped to handle 15,000 carloads or 400,000 tons of freight on a 30-day turnover basis.

The principal buildings include two main warehouse structures, 200 x 980 feet and 240 x 980 feet, respectively; a mechanical and repair shop; a 4-story administration building and three transfer sheds or pier houses, each 150 x 1350 feet, which function in the transfer of freight to and from the cargo carriers. In handling freight in this extensive plant, it is carried on 4-wheel trailer trucks, which are moved horizontally by industrial plant tractors and vertically by means of elevators of a new and distinctly novel type. Material remains on the original trailer trucks from loading point to destination, greatly reducing extra handling. The trailers usually are moved in trains of four or five if loaded, and from six to eight if light. One man with a tractor handles the train.

The depot is served by 96 elevators, 90 of which are for freight service and six for passengers. Each of the freight elevators has a capacity of 10,000 pounds. Eighteen of this type are in the pier sheds, serving two floors and having a speed of 100 feet per minute, while 72 are in the warehouses, serving nine floors and operating at a speed of 150 feet per minute. Each elevator is equipped with an automatic levelling device which causes the elevator floor to register accurately with the landing sill. The door opens automatically when the elevator reaches the floor to which it has been dispatched. A dispatcher controls the movements of a battery of elevators, no operators being required on the cars. The elevators are installed in groups of from seven to 10 serving a section about 325 feet long in each warehouse building.

Central Dispatch Control

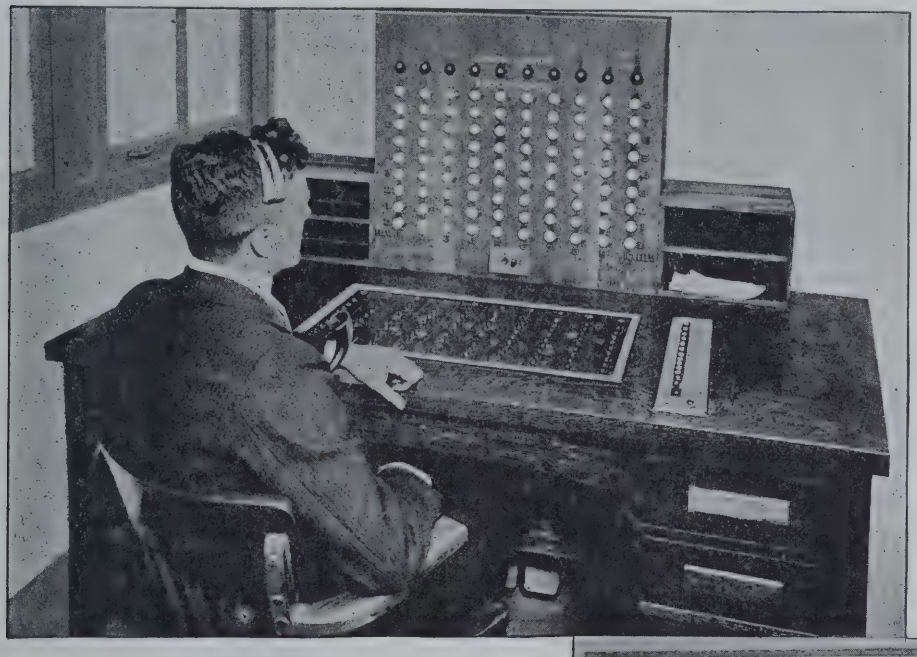
Each group of elevators is handled entirely by a central dispatcher, who is located in an office placed for convenience a short distance from the group. Before him is a table, shown in Fig. 1, which is not unlike a telephone switchboard, with one upright and one horizontal panel. In the upright panel is a column of white lights for each elevator, each light representing a floor. At the top of each column is a colored light which indicates, when lighted, that all hatchway doors are closed and the elevator can be operated. The operating buttons are placed in rows in the horizontal panel.

This system gives the least waiting time and maximum service from a given number of elevators. In general or miscellaneous service, the dispatcher receives calls for cars from the various floors. As an example, the dispatcher gets a call for a car from the seventh floor to take goods to the third floor. A quick glance at the vertical panel shows that car No. 5 is standing idle at the sixth floor, since its "6" white light is burning. The colored lamp at the top of the row is lighted, indicating that all doors are closed. The central dispatcher then touches "7" button and the white light disappears as the car leaves the sixth floor, and shortly signals arrival at the seventh floor by means of a light in bulb "7." As the doors open automatically the colored light is extinguished and the car is out of the control of the dispatcher and cannot be run until some one on the seventh floor touches one of the seventh floor door closing buttons, of which one is on either end of the car and two others alongside the opposite entrances. As soon as the load has been run on and the door button pushed the doors close and the colored light again appears, signaling to the dispatcher that all is clear to go ahead. He then touches "3" button, thereby dispatching the car to the third or destination floor.

A push button controlled elevator has recently been developed which stops the car automatically with any desired accuracy and with any load within its capacity. When the position of the car changes during the loading and unloading, due to the

lengthening or shortening of the cables, the car is automatically and quickly restored to the landing level. This remarkable accomplishment made it not only possible but more advantageous in this case to operate the freight elevators by a central dispatcher than by individual operators on each car.

How Cars Are Stopped



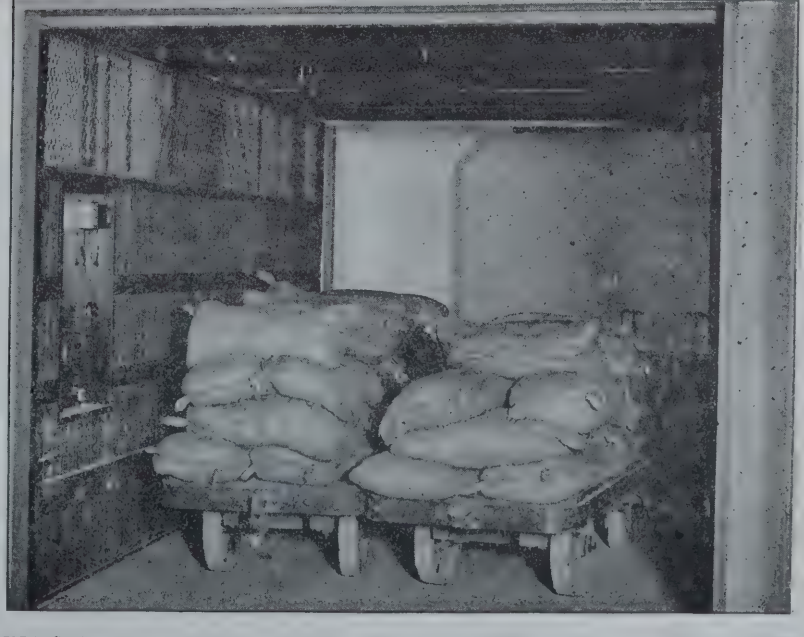
The main driving machine is of the worm gear type and is driven by a 2-speed alternating current motor giving full and one-third speed. The device for stopping the elevator accurately consists of motor, brake and worm gearing of about one-tenth of the speed and power of the main machine. This drive is mechanically connected to the main machine through the revolving electromechanical main brake. The slow motion of the device for stopping through the final few inches of travel in connection with a novel system of control, results in the car stopping level with the landing with any load to the full load capacity of 10,000 pounds.

The accurate stopping operation is applied to car switch as well as automatic push button control. In this case the operator throws his switch to the stop position on approaching the floor just as in the operation of the ordinary car switch control. If the car is within the stopping zone, the stopping drive functions and stops the car level with the floor. Although the stopping or leveling zone extends 8 inches above and below floor levels, in actual service the average movement is usually not more than 3 inches.

The doors are operated by an ingeniously arranged mechanism which automatically opens the doors at the floor to which the car has been dispatched and as the car approaches that floor. As the door operating machine starts to open the doors when the leveling zone is reached by the car, it is obvious that the leveling is accomplished while the doors are being opened and therefore no additional time is required for leveling. The door closing operation can be initiated only by touching a closing button either on the car or alongside the door opening on the floor. The doors themselves represent a radical development in elevator hatchway doors.

Consideration of the trailer truck problem pointed the way to doors of maximum height and rising from fixed sills. Due to the high door openings and limited story height it was necessary that the door operating mechanism be so arranged as to first move the door horizontally into the hatchway a sufficient distance to clear the sill and door above and then to raise the door vertically to clear the opening. These doors are made of a steel frame with panels ¾ inch thick of sheet steel and asbestos composition. In case of emergency, the cars can be run with the doors open.

Ships are unloaded in part on both piershed levels, and goods in transit between the warehouse and first transfer shed level reach or leave the latter on trailer trucks by way of the 18 automatic elevators with which the sheds are equipped. These elevators are operated individually by means of buttons on each floor and in the car. In all other features they duplicate the warehouse elevators.



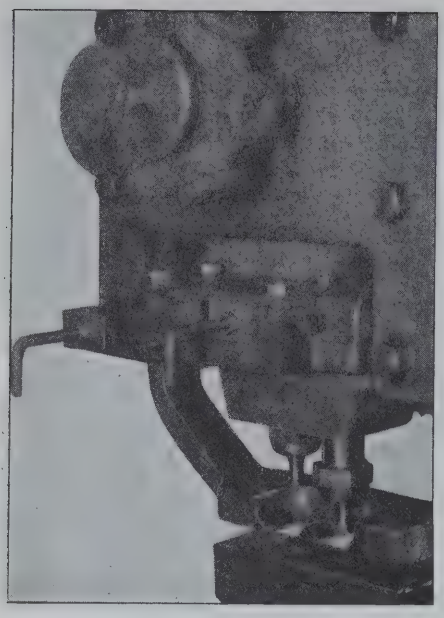


FIG. 1—DISPATCHER AND AUTOMATIC CONTROL BOARD IN STATION FIG. 2—LOADED TRAILERS READY TO LEAVE ELEVATOR

Electric Rivet Heater

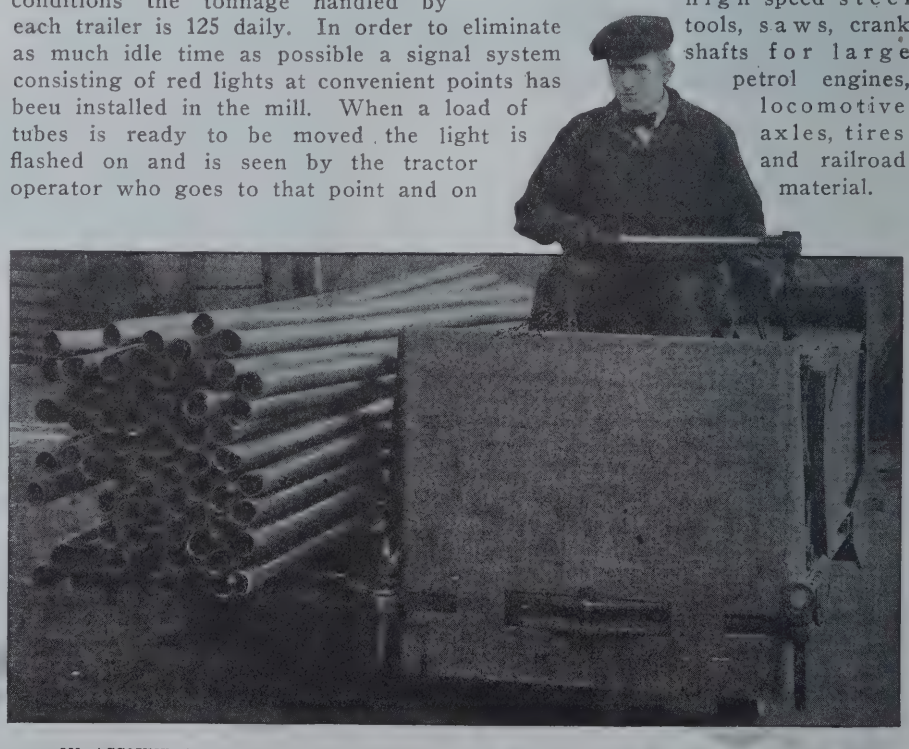
An electric rivet heating forge has been invented by Geo. A. Jones, New London, Conn., and business men in Worcester, Mass., are endeavoring to induce the new industry, which is contemplated in the manufacture of this forge, to locate in that ctiy. It is said that Springfield, Mass., is also anxious for this industry. The new device is simple, consisting of two electrodes placed one above the other in such a way that the rivets to be heated span the gap. The forges which have been tested heat two rivets at one time and use a current of four volts pressure. In some cases it has been found possible to place the rivets through the holes in the steel

DOUBLE GAGGED PUNCHING ATTACHMENT

which is to be fabricated and to heat them afterwards in place. It is reported that large rivets are heated in 12½ seconds and that no scale is left after heating.

Tests Tool Steel in New Machine Shop

Desiring to gain first hand knowledge of the performance of its tool steel in actual service, the Ludlum Steel Co., Watervliet, N. Y., has completed a large new machine shop, which covers one-third of an acre. It has been provided with a full complement of machine tools, so that practically all conditions actually existant in machine shops can be duplicated. All grades of tool steel manufactured by the company are thoroughly tested in actual machining operations so that their performance under all conditions can be measured. As a result of the tests in this department, the company is able to select, by actual tests, the grade of steel best suited for a particular requirement. The new machine shop supplements the work of the company's research department, which is fitted up with a transformation point meter, magnetic testing apparatus, Fahy permeameter, physical testing machines, resistance and arc furnaces for making trial melts, and extensive equipment for making chemical analysis.



Designs Double Punch Attachment

The double gagged punching attachment shown in the accompanying illustration, which recently was developed by the Cleveland Punch & Shear Works Co., is fitted with a spring to lift the punch clear of the material when the gag is withdrawn. Each gag is individually operated and has a long taper and so that when the gag is inserted the taper end acts as a wedge and forces the punch stem down. This attachment is especially adapted for use with a spacing table and or when the plate has two sizes of holes. As one punch stem is entirely clear of the material even when the plunger is at the bottom of its stroke. Therefore there is no interference or dragging of the disengaged member. The centers are fixed.

Use Side-Coupled Tractor in Tube Plant

A novel method of coupling an electric tractor to a trailer is employed at the plant of the Globe Seamless Steel Tube Co., Milwaukee. On account of the length of the tubes, which overhang the ends of the trailers several feet on either end it was found advisable to provide forged eyebolts at the corners of the trailer and tractor so that they might be coupled alongside of each other. This method of coupling enables the tractor to move trailers carrying tubes as long as 26 feet with ease and dispatch. Prior to the time when this plan was adopted trouble was encountered when pushing a load of greasy tubes by butting the tractors against tube ends because of the danger of pushing the load from the trailer.

It is estimated that under present conditions the tonnage handled by each trailer is 125 daily. In order to eliminate as much idle time as possible a signal system consisting of red lights at convenient points has beeu installed in the mill. When a load of tubes is ready to be moved the light is flashed on and is seen by the tractor operator who goes to that point and on passing the drop cord switch turns out the light. The tractor shown in the accompanying illustration, side-coupled to a trailer loaded with long tubes, is the product of the Elwell-Parker Electric Co., Cleveland.

ON ACCOUNT OF OVERHANG OF TUBES, TRACTOR IS COUPLED ALONGSIDE OF TRAILER

Old Manganese Deposits

During the war, an attempt was made, on a large scale, to reopen the abandoned manganese ore works at Hohenkirchen, near Cassel, but the residual quantity of ore proved disappointing, and the work has been given up.

The deposit occupies an oval basin, 3000 feet long by 833 feet wide, on the boundary of the tertiary and buntsandstein formations. The ore is a manganiferous ironstone, the upper 60-80 cm. being silicious with 5-10 per cent of manganese, the middle 15-20 cm. being higher grade (15 per cent Mn.), and the lower 30-40 cm. silicious ironstone with only 2 per cent of manganese. The simplest explanation of the formation of the deposit is considered to be that iron and manganese became concentrated on the surface, in tertiary times, by the weathering of the buntsandstein.—F. Beyschlag, *Zeitschrift fur praktische Geologie.*

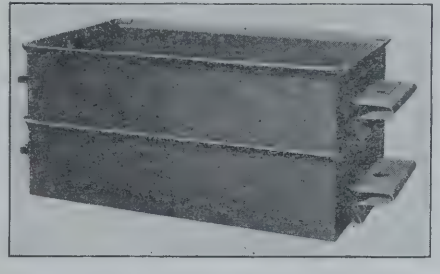
An exhibition of British manufactures is being held in Athens, promoted by the Federation of British industry and supported by King Alexander, of Greece. Its purpose is the extension of British trade in the Near East. The exhibits include cutlery, high speed steel tools, saws, crank shafts for large petrol engines, locomotive axles, tires and railroad material.

Designs New Tote Box

A new metal tote box recently developed by the E. F. Hauserman Co., Cleveland, is designed to withstand hard usage. As shown in the accompanying illustration, boxes of this type which are used for carrying material from place to place and as receptacles for small parts, are constructed so as to make stacking relatively simple.

The upper edges of metal on the sides and ends are folded back on the under sides and welded. The insides of the four upper corners are reinforced with electrically welded plates of No. 14 gage steel. Care has been taken to provide large and broad handles with no edges of metal above the handle to become loosened and dangerous to the hands of workmen. To prevent sagging and to prolong the life of the box, the bottom is strengthened by two heavy 1-inch strap steel runners welded the length of the box. These runners prove advantageous when loaded boxes are drawn over the floor.

Production of Iron in Sweden Lagging



Unsettled conditions in the world markets, over production in the iron industries of larger countries, the selling of government war stocks and difficulties in the mode of payment arising from abnormal foreign exchange, are circumstances which are weighing heavily on the iron producing industry of Sweden, according to an article in a recent issue of *Swedish Export*. The article states that depression in the industry noted during the first quarter of the year was still more evident during the second quarter.

Figures compiled by the Iron Works association for the second quarter, show that of 131 blast furnaces existing at the first of the year, only 52 were in operation at the end of the second quarter; that only 33 per cent of the Lancashire hearths, 35 per cent of the bessemer furnaces and 45 per cent of the open hearth plants, were operating at the end of this period.

The article commenting on iron and steel exports states that these have been reduced nearly 50 per cent, the reduction being most marked in pig iron, rough bars and bar ends. Counteracting the reduction of exports in these lines, to a small extent, have been small increases of exports in tubes, blooms, plates and sheets, as well as nails and tacks. Although the increases in these products were not large enough scarcely to affect the final figures, the article points out, that they indicate the period of reconstruction has set in, with the hope of brighter prospects for the iron industry.

The month of July showed some improvement in regard to rolled iron and steel, and increased demand acted as a check to the steady fall in prices, and in some instances caused small increases for the more important rolled products. In August there was a decrease in the number of orders but prices remained unchanged.

According to the article the position of the exporting blast furnaces has been the worst and although they still continue to operate, they are doing so at the bare margin of loss, and in many cases below it. The accompanying table shows the production of iron for the first and second quarters as well as for the first half year. It also shows the differences between the 1918 output and that of 1919. The figures are in tons.

NEW TOTE BOXES ARE REINFORCED AT CORNERS AND ON BOTTOM

PRODUCTION IN TONS

	Jan. 1 1918	July 31 1919
Pig iron inclusive of castings made direct from the ore	477,400	338,200
Blooms and rough bars	58,800	39,900
Bessemer ingots	39,700	30,900
Open-hearth ingots, inclusive of castings	261,300	242,300
Crucible and electro ingots	6,500	6,200
Rolled and hammered iron and steel, prepared for market	201,500	179,400

Adding New Mills

The Interstate Iron & Steel Co. is undertaking considerable additions to its South Chicago plant, the principal item of which is the installation of the Morgan continuous bar mill of 16-inch, 14-inch and 12-inch stands, with an additional 75-ton open-hearth furnace, heating furnaces and other essentials in connection with this mill. Construction will be hastened and present plans indicate the installation will be in operation during the latter half of 1920.

Other improvements are under way, including a complete rearrangement of the scrap yard, with a crane runway and large cranes for handling the scrap and skull crackers.

Will Meet in South

The twelfth annual meeting of the American Institute of Chemical Engineers, to be held at the Hotel De Sota, Savannah, Ga., Dec. 3-6, will be devoted largely to southern chemical industries. Among the papers to be presented are the following:

"Developments of Some Southern Industries," by R. K. Meade; "Accident Prevention in the Mill," by H. K. Moore; "Double Pipe Boilers," by George A. Richter; "Recovery of Pyridene Bases at By-product Coke Ovens," by F. D. Dodge and F. H. Rhodes; and "Acid Electric Furnace Ferrotungsten," by J. G. Dailey. Discussions will follow the papers.

A number of inspection trips to industries in and near Savannah have been arranged.

Better Letters Will Be Topic at Meeting

The third annual conference of the Better Letters association will be held at Hotel Cleveland, Cleveland, Nov. 20 and 21, and an interesting program has been arranged. A large attendance is expected. Discussions bearing on all phases of business letter writing will be led by men who are well acquainted with this phase of modern business. Some of the subjects will be, "The Business Letter"; "Training as a Basis for Success as a Writer Salesman"; "How to Express Oneself Effectively in Writing," and various other subjects all pertaining to modern business correspondence.

Organization of the Better Letters association was effected at Worcester, Mass., in 1917 at the close of a two-day conference by business men, in presenting and discussing the possibilities of more effective letters in business. Since then the organization has grown steadily. H. N. Rasely, of the Norton Co., Worcester, Mass., is secretary-treasurer of the association.

Furnace Not Placed

Correction is herewith made of statement carried on page 1067 of the October 16 issue of THE IRON TRADE REVIEW to the effect that the Mitsubishi company, of Japan, with American offices at 120 Broadway, New York City, had awarded a contract to C. H. vom Baur, 15 Park row, for a 1-ton electric furnace. This contract has not yet been awarded.

Steel Exports Lose August Gain

September Shipments Fall to a Low Figure After Recovery During the Preceding Month—Imports Make a Gain of 50.3 Per Cent and Set the Highest Mark Reached Since April 1917

AFTER showing a partial recovery in August, exports of iron and steel in September fell to a low figure, the third lowest during 1919, while imports jumped to the highest point since April, 1917. The drop in exports was in no way proportionate to the gain in imports. Although the strike of longshoremen in New York was at its height during September and affected the situation to some extent, the greater part may be assigned to the exchange situation.

Exports for September totaled 363,531 gross tons, a decrease of 33,212 tons or 8.4 per cent over the August total of 396,743 tons. This tonnage compared with the high mark of 653,344 tons in December, 1917, represents only 55.6 per cent while August's total represented 60.7 per cent. Gains were made in steel billets, ingots and blooms, steel rails, sheets, tin and terne plate, barbed wire, cut nails and spikes. With the exception of rails which showed a gain of 9724 tons and tin and terne plate with a gain of 7573 tons, all other increases were small, some amounting to only a few tons. At the same time most of the losses were small with the exception of pig iron which fell 17,080 tons, structural iron and steel which dropped 11,118 tons, and wire which decreased 4672 tons.

Imports with 43,567 tons was a gain of 14,580 tons over August or an increase of 50.3 per cent. The gain of August over July was only 2.58 per cent. Outside of steel rails practically all products gained slightly. Pig iron improved by 12,737 tons and scrap by 2677 tons.

A gain of 10,038 tons was made in imports of iron ore, the September figure being 42,155 tons compared with the August figure of 32,117 tons.

EXPORTS PIG IRON AND SEMI-FINISHED

Building Activity

In Detroit Involve Expenditure of $60,000,000—Equipment Needed

Detroit, Mich., Nov. 17.—Plans for $60,000,000 worth of industrial and mercantile construction work requiring steel work are in the hands of architects and contractors and there is a brisk demand for structural steel.

The new work includes building operations involving $8,000,000 for the Detroit-Biltmore Hotel Co.; $5,000,000, First & Old Detroit National bank; $5,000,000, General Motors office building; $3,000,000, Detroit Seamless Steel Tubes Co.; $2,500,000, apartment hotel; $2,225,000, Hudson Motor Car Co.; $2,000,000, Wolverine hotel; $2,000,000, Goodyear Rubber Co.; $2,500,000, convention and motor sales auditorium for the Thompson Auto Co.; $2,000,000, National Biscuit Co.; $1,750,000, Packard Motor Car Co.; $2,000,000, Paige-Detroit Motor Car Co.; $1,600,000, Cadillac Motor Co.; $3,000,000, Fisher Body Corp., and $12,000,000, Maxwell Motor Co.

The Ford Motor Co. development work at River Rouge entails an outlay of more than $25,000,000, while the development of the Canadian Steel Co.'s townsite of Ojibway, Ont., across the Detroit river, calls for expenditure of $75,000,000 in time.

The Maxwell Motor Co. has started erection of the first unit of its new $12,000,000 plant. It will be a sheet metal plant, costing $750,000. The Detroit Gear & Machine Co. has issued $800,000 of new preferred stock to finance new plant equipment and additions. The Hudson-Essex Motor Co. will begin operations in a new $1,200,000 assembly plant Nov. 15. A machine shop and heat treating plant will be completed by Jan. 1, for which $700,000 of equipment is now being purchased.

Tool and machinery distributors are unanimous in declaring that as soon as the steel and coal strike situations are cleared there will be a pronounced increase in orders for all kinds of tools, machinery and shop equipment. Demand for factory supplies far exceeds that of a year ago.

The Chevrolet Motor unit of the General Motors Co., is installing new equipment in its Bay City plant.

Additions to the plant of the Continental Motors Corp., Muskegon, Mich., will be completed by Dec. 1. They include a building 480 feet long to be added to the assembly plant, a steam plant with five boilers, and a new drop forge plant. The Hoover Steel Ball Co., Ann Arbor, Mich., has absorbed the Chelsea Steel Ball Co., of Chelsea, Mich.

Among the corporations recently filing notice of increased capitalization are Dail Steel Products Co., Lansing, Mich., from $100,000 to $250,000; Quality Tool & Engineering Co., Detroit, $20,000 to $50,000; Steel Age Mfg. Co., Battle Creek, Mich., $100,000 to $250,000; General Steel & Wire Co., Detroit, from $75,000 to $125,000 and the Colonial Tool Co., Detroit, $15,000 to $30,000.

Company Formed to Make Steel Conduit

The Steelduct Co., capitalized at $100,000, was organized recently at Youngstown, O. Offices have been opened at 618 Dollar Bank building. The company will manufacture enameled and galvanized rigid-steel conduit at Mineral Ridge, near Niles, O. William B. Curtis is president and treasurer, and John A. Logan, III, is vice president and secretary. For the past eight years Mr. Curtis was associated with the Youngstown Sheet & Tube Co., Youngstown, O., and at the time of his resignation from the company was handling conduit sales. He was the first advertising director employed by the Youngstown Sheet & Tube Co. Mr. Logan is the largest stockholder of the Ohio Steel Products Co., Mineral Ridge, O.

Pig Iron Men Elect

R. H. Sweetser, works manager of the American Rolling Mill Co., Columbus, O., was elected president of the Southern Ohio Pig Iron and Coke association, at its second annual meeting held in Columbus, O., recently. Other officers were elected as follows: First vice president, E. O. Marting, the Marting Iron & Steel Co., Ironton, O.; second vice president, Chas. R. Peebles, Ashland Iron & Mining Co., Ashland, Ky.; third vice president, W. R. Knapp, superintendent, the Portsmouth Solvay Coke Co., Portsmouth, O.; fourth vice president, N. G. Spangler, general manager, the Jackson Iron & Steel Co., Jackson, O.; fifth vice president, J. T. Savage, the Hamilton Furnace Co., Hamilton, O.; secretary-treasurer, J. H. Briscoe, Eaton, Rhoades & Co., Cincinnati.

The November meeting of the Southern association was held at the Hotel Marting, Ironton, at 1:30 p. m., Wednesday, Nov. 12. At this meeting the committee on "furnace rating" reported. Chas. R. Peebles, of the committee on standards, then presented a paper on "The Method for Determining the Rated Capacity of a Blast Furnace."

Higher Prices

Ruling on Spot Sulphate—Early Advance Expected in Benzol

New York, Nov. 17.—Spot sulphate of ammonia has advanced to $3.70 to $3.80 per 100 pounds compared with $3.50 to $3.75 previously. This rise is the result of the scarcity of material. All producers virtually are sold up until July 1. Future buying, owing to the season and the extent to which producers are booked ahead, is practically nil. Some spot buying is being done for export at $4.25 to $4.50, eastern seaboard.

Old contracts continue to absorb the great bulk of available benzol. Prices, however, remain unchanged though an advance is expected. Pure benzol is quoted at 24 to 29 cents and 90 per cent at 22 to 24 cents. The rubber industry is the largest consumer at present. Demand for motor fuel is seasonably dull.

Demand for toluol is featureless, except for its steadiness. Prices are unchanged at 26 to 30 cents. The market on solvent naphtha also is steady. Rosin manufacturers are buying in good quantities, and prices are holding at 22 to 27 cents for both spot and contract.

While demand for naphthalin is falling off slightly, good sales continue. The market is steady at 6½ to 7½ cents flakes, and 8½ to 9½ cents for balls.

Coke Oven By-Products

Spot

Per Gallon at Producers' Plant

Pure benzol	$0.25 to .29
Toluol	.26 to .30
Solvent naphtha	.22 to .27

Per Pound at Producers' Plants

Phenol	nominal
Naphthalin, flake	0.06½ to .07½
Naphthalin, balls	0.08½ to .09½

Per 100 Pounds at Producers' Plants

Sulphate of ammonia	3.75 to 3.80

Contract

Per Gallon at Producers' Plant

Pure benzol	$0.25 to .29
Toluol	.26 to .30
Solvent naphtha	.22 to .27

Per Pound at Producers' Plant

Phenol	nominal
Naphthalin, flake	0.06½ to .07½
Naphthalin, balls	0.08½ to .09½

Per 100 Pounds at Producers' Plants

Sulphate of ammonia	nominal

After being relined and overhauled, the Port Henry, N. Y., furnace of Witherbee, Sherman & Co. was put in blast on Oct. 7. It will produce some malleable but mostly foundry iron. A pig casting machine is being installed at this stack.

Selling Last of Surplus Steel

Ordnance Department Disposes of 106,000 Tons of Shell Billets at $33, and 71,000 Tons of Forgings at $24.05 and $24.50—Offering Cold-Drawn Screw Stock, Hot-Rolled Bars and Miscellaneous Scrap

WASHINGTON, Nov. 18.—The ordnance department of the war department has disposed of its remaining surplus of shell-steel billets and its present surplus of shell-steel forgings, and is about to offer for sale its present surplus of cold-drawn screw-stock steel, hot-rolled bars and miscellaneous scrap. Not only is the work of the department in selling its surplus steel drawing to a close, but it is making good on its policy of demanding a fair price for the tonnages.

E. A. Schwartzenberg, Cleveland scrap dealer, has just bought the remaining surplus of shell steel billets, approximately 106,000 tons, at $33 per gross ton, f.o.b. Pittsburgh. This figure is from $5.50 to $9 a ton under the Pittsburgh price for soft 4 x 4 billets. The bids submitted to the war department for its remaining stock of shell-steel billets ranged from $29 to the figure at which the sale was made. The steel was acquired by the Cleveland dealer for rolling and forging purposes. It is located at Boston, Buffalo, Pittsburgh, Cleveland, Chicago, St. Louis, Cincinnati and Toledo. The ordnance department has made previous sales of shell billets which aggregated approximately 34,000 tons at prices which averaged $32 a ton.

The department soon will offer for sale by negotiation its present surplus of cold-drawn screw-stock steel and hot-rolled bars, consisting of about 25,000 tons, and its present surplus of miscellaneous scrap, including both iron and steel, which approximates 40,000 tons. Informal bids on this material will be requested by the ordnance salvage board, Munitions building, Washington. It is announced that persons who desire to be informed of these offerings should communicate with the ordnance salvage board immediately.

Recently as stated in last week's IRON TRADE REVIEW the ordnance department sold by negotiation 71,000 tons of shell-steel forging to Briggs & Turivas, Chicago. These stocks of forgings were also sold by negotiation, bids having been made by a number of dealers in steel scrap. The sale of forgings to this firm consisted of 20,000 tons at $24.05 per gross ton and 51,000 tons at $24.50 per gross ton, Pittsburgh. These tonnages constituted the entire present surplus of shell forgings, slugs and unit billets held by the ordnance department and the prices received were from $2 to $2.50 higher than the price of heavy melting scrap at Pittsburgh.

Trade to Decide Base Point Question, Says Colver

Washington, Nov. 18.—William B. Colver, member of the federal trade commission, in an address before the National Coffee Roasters' association at Atlantic City last Friday, discussed some of the commission's functions and mentioned the steel basing point case, which is to be heard commencing Dec. 2. Mr. Colver explained how trade practices in industries other than steel have already been investigated by the commission and detailed the commission's procedure in conducting such investigations. He said:

"Practices which are alleged to be unfair and contrary to the public interest are submitted publicly to the representative men affected by those practices, and the industry itself is asked to declare for the guidance of the commission what it deems to be the law-merchant and to set its mark of disapproval upon unfair practices. We have found that business men, asked to declare what is right and fair, check the razor of business rivalry at the door, sit side by side and discuss frankly and freely the abuses which have grown up in their trade. Neither the fact that a given practice is almost universally employed or that by reason of its age it has come to be more or less accepted as an inevitable thing, stands in the way of a frank and decisive condemnation of it by the industry itself.

"Thus, the commission secures for its guidance the mandate of business as to what is and what is not unfair, and thereafter if the practice is persisted in and application for complaint is made, the commission proceeds with the certain knowledge that it has the backing and the sympathy and understanding of the vast majority of the men in that industry.

"In such a trade practice submittal, the commission is itself making no rules, expressing no opinion and rendering no order. The purpose is the gathering of the best judgment of the industry as to what is fair and what is not fair.

"The most far-reaching matter of this sort that is now before the commission involves the question as to whether or not the public interest and industry is best served by the ancient custom of having a single basing point price for iron and steel products, or whether there should be two or more basing points for the computation of selling prices. Not only will a determination of this question go to the very foundation of the iron and steel industry, but it will have a widespread effect upon a great many other industries whose products are commonly sold on the basis of a certain few selling points."

Manufactures Census to Begin Next Month

Washington, Nov. 18.—Special effort is being put forth to make the manufactures section of the approaching fourteenth decennial census the most complete and comprehensive inventory of the nation's manufacturing establishments ever taken, according to officials of the bureau of census who have this work in charge.

The schedules to be used in tabulating the information concerning the country's industrial resources have already been prepared and printed. These schedules will be mailed to every manufacturing establishment in the United States during December. The questions relate to the calendar year 1919.

In 1914, the year the last manufactures census was taken, about 275,000 manufacturing establishments were listed by the census bureau. This time more than 300,000 establishments will be sent schedules. In addition to this it is expected that about 50,000 mines and quarries also will be reported.

The inquiries relating to manufactures, as specified by the act of congress providing for the census, include the name and location of each manufacturing establishment; character of organization, whether individual, corporate or other form; character of business or kind of goods manufactured; amount of capital actually invested; number of proprietors, firm members, copartners and officers, together with the amount of their salaries; number of employes and amount of their wages; quantity and cost of materials used in each establishment; quantity and value of products; principal miscellaneous expense; time in operation during the year; character and quantity of power used; character and number of machines employed.

The foregoing questions will be cov-

ered by the general schedule which every establishment will receive. In addition to this a supplemental schedule will be sent to the 68 principal industries as classified by the census bureau. This supplemental schedule will allow detailed statistics of output to be set forth under the heading "products manufactured."

Tools Go to Schools at 15 Per Cent of Cost

Washington, Nov. 18.—Congress has adopted the conference report on the machine tool bill and it now is before the President for his signature. As finally enacted, the measure, which provides for the disposal of surplus machine tools held by the war department to educational institutions of the United States, authorizes the secretary of war to sell the tools at the rate of 15 per cent of their cost. This represents a compromise between the senate and house conferees. The house bill fixed the price at 10 per cent of cost and the senate bill fixed the price at 20 per cent. The senate measure also provided that the money realized from the sale of machine tools may be used by the secretary of war to defray expenses incident to the distribution of the tools, except the cost of transportation, and that the balance shall be turned into the treasury as miscellaneous receipts. The house conferees agreed to the change.

Announcement has been made by the director of sales that the salvage officer at the Springfield, Mass., armory has been authorized to offer for sale under sealed proposals 230 used machine tools at the armory. Bids will be opened at 2 p. m., Nov. 23, by the salvage officer.

The machine tools are said to be in fairly good condition and were used until recently at the Springfield arsenal. In instances minor parts are missing, and prospective purchasers are invited to inspect the condition of the machines before submitting bids. The offering includes wood lathes, screw machines, turret lathes, hand millers, drills, drill presses, hammers, punch presses, shaving machines, etc. A complete inventory of machine tools offered and information regarding the terms of sale may be obtained from the salvage officer at the arsenal.

590 Ships Used in War Returned to Service

Washington, Nov. 18.—Prompt redelivery by the war department of cargo troop transports to the shipping board and the American merchant marine has proved a most potent economic transaction for the government in reducing the enormous cost of war operations, according to an announcement from the office of the chief of transportation service. It also has proved a most timely stimulus to the merchant marine in lifting the great congestion of export cargo that accumulated at American seaports for shipment to all parts of the world. The war tonnage that has been redelivered by the transportation service reached a total of 590 ships of 3,911,000 tons deadweight, not including 24 battleships of 352,395 tons displacement, pressed into service as troop carriers, and two troop ships and 31 cargo ships which were sunk.

To Abandon Sandy Hook Proving Ground

Washington, Nov. 18.—Following a conference of a board of officers at Fort Hancock, N. J., recently, it has been determined to abandon the Sandy Hook proving ground in the near future. Tests which otherwise would be made there will be conducted at the new and larger grounds at Aberdeen, Md. It was recommended by the board that certain shops and storehouses at Sandy Hook be turned over to the engineer department for use in connection with its work of construction and maintenance in the New York engineer district, and that all buildings, structures and facilities be turned over to the coast defense commander.

The board further recommended that the post and facilities at Sandy Hook be utilized under instructions of the commanding general, middle Atlantic coast artillery defense, as a vocational school for the purpose of training enlisted men and young officers for short periods in practical artillery work.

Vocational Training to be Given Service Men

Washington, Nov. 18.—Broadening the duties of the assistant to the secretary of war has been determined on so that his staff hereafter will assist all who need vocational training. In the past the office has been concerned only with jobs for service men.

Maj. Gen. William G. Haan, director of the war plans division of the general staff, has now directed all field representatives of the department, engaged in soldier employment work, to give special attention to aiding disabled veterans. This corps of representatives, under the direct supervision of Lieut. Col. Mathew C. Smith, of the general staff, has been in the field for over six months engaged in placing discharged service men in jobs. Their work has carried them into practically every city and community of the United States, and the connections which they have established with various industrial plants, as well as with civic and welfare organizations, and their knowledge of local conditions, it is believed, will make them most valuable in aiding wounded and disabled veterans.

"Our field representatives have heretofore assisted the disabled men where possible, but in the future this is to be a special feature of their work," said General Haan. "We propose to establish close connection between the different agencies interested in the welfare of soldiers, including the American Legion and the Association of Disabled Veterans, and the district vocational board officer, and secure their co-operation."

Navy Wants Steel

Washington, Nov. 18.—The navy's bureau of construction and repair will receive bids until 10 a. m., Nov. 25, on 7440 tons of special treatment steel plates and 3960 tons of nickel steel plates, for battleships Nos. 49, 50, 51 and 52 which are now under construction in the Brooklyn, Norfolk and Mare Island navy yards. Each vessel is to require 1860 tons of special treatment steel plates and 990 tons of nickel steel plates, delivery of which is to be at the monthly rate of 310 tons and 165 tons, respectively, commencing December, 1919. Quotations are to be net only.

Decide on Tunnel

New York City authorities have finally decided to build a tunnel between Manhattan and Staten island. Surveys, maps and plans now are being made by engineers under the direction of John H. Delaney, transit construction commissioner. It is expected that construction will begin in 1920. Public hearings are to be held by Commissioner Delaney to aid in determining whether the tunnel should connect with the Fourth avenue subway in Brooklyn and extend to St. George, Staten island, from a point at Sixty-fifth street, Brooklyn, or whether it should connect with the Interborough subway at the Battery. It is estimated that a tunnel under the shorter stretch of water could be built for about $12,000,000, whereas the longer tunnel would cost about $20,000,000.

Menace in Unions' Propaganda

Manufacturers Must Take Steps to Neutralize Effects of Labor-Farmer Conference, Declares Founders' President—Warns of Effort to Gain Control of Government—Open Shop a National Principle

TWO years ago the open shop was a local issue; now it is a national principle," declared William H. Barr, president, National Founders' association, in speaking at the opening of the association's twenty-third annual convention in Hotel Astor, New York, Nov. 19. Representatives of the employers in the national industrial conference were given credit for blazing a wider path toward independence in industry and employers were urged to take a firm stand against any encroachments on their rights which may be designed at the labor-farmer conference in Washington, Dec. 13. He said:

"Notwithstanding the fact that industry has been brought under the law, and manufacturers abide by its limitations, organized labor prefers to defy the law and control those forces whose duty it is to uphold it. In this attempt they also fail to understand that we do not derive our right to do business from the government, but given civil liberty, have developed a government to protect all citizens. The serious element in the situation is the attitude of the militant labor unions.

"A few years ago we did not class them as radical because there was an element of conservatism which restrained their activities. Today this conservatism has been abandoned, and the purpose of labor unionism is as unamerican as that of the organizations which are admittedly anarchistic. The labor unions have in recent months given perfect object lessons as to their radicalism, but there is still that general misunderstanding which prevents us from realizing the significance of what is still in contemplation.

"The question of radicalism goes deeper than agitation and unrest, the fundamental factor in the situation being the attempt of a limited class to assume all power over industry and government, of which heretofore they have been able to control only a small part.

"In a supreme effort to partially remedy this state of affairs the men who sat in the industrial conference at Washington, representing the employers of the country, did their full duty, under tremendous pressure. They realized their obligations as representatives of the great industries, and submitted an intelligible, workable program which was loyally supported when the issue was joined on questions which should not have come before the conference. They properly declined to be a party to passing the control of our industries, the fortunes of 35,000,000 of nonunion workers, and the welfare of the nation, into the hands of a few union agents.

"Gentlemen, you cannot pay too much honor to the employers' group in the recent industrial conference. They blazed a wider path toward independence in industry, and it is for you to follow that trail of the open shop, its only permanent safeguard. The employer members recognized that our greatest problem is that of production for the effective maintenance of both our domestic and our foreign markets. They understood that production is decreasing, because of plans which are designed to bring about an industrial condition where radical propaganda may become a factor. But the industrial conference was not permitted to touch upon production or increased efficiency. It was not permitted to indicate the present relationship between wages and cost of living. It was allowed only to consider the question of a national closed shop, and failing to approve, the conference was dissolved because the labor representatives refused to go further.

"That there is no room for anarchy is the gospel which every right-thinking American should preach, and there is little difference between the radical who preaches revolution under the red flag of confiscation and the organizer who preaches revolution under the black flag of labor unionism. On the other hand, I believe that unionism in its inception and original purpose did represent a humanitarian movement. Forty years ago labor was oft-times niggardly recompensed, improperly taken care of, and the employers of the country did not pursue the broad policy followed today. For we have traveled far and fast in a conscientious development of our duty toward workers, and conditions in most open foundries are all that humanitarianism could rightfully expect. This is not so true in closed union foundries where the limitation of output always practiced, cuts to a minimum the earnings of the owner, making it difficult to finance modern manufacturing improvements.

"On Dec. 13 a significant labor-farmer conference will be held in Washington, and any farmers who may participate will be merely the representatives of paper organizations committed to a familiar type of propaganda. The great, conservative National Grange will not be represented. The plan is that which the Non-Partisan league formerly attempted and in which it was only partially successful. The present scheme is more ambitious and its success depends greatly upon the attitude of the farmers, and to some extent upon yours. The farmer is to be told that government ownership is desirable, that collective bargaining is progression, and that private ownership of the railroads means increased rates. He is to become the recipient of propaganda designed to convince him that a union with organized labor will mean betterment for himself.

"The farmer is one of the general public. He is not as familiar with economic manufacturing conditions as foundrymen should be, and it is possible that his own overenthusiastic leaders may attempt to guide him into this unprofitable and dangerous alliance. The relationship of the manufacturer and the farmer must be presented to the farmers in its true light. This cannot be done without funds, for which an appeal will be made. I am emphasizing the necessity and if you will realize the situation you will give assistance without urging and with a full appreciation of its advisability."

Plant Officials Take Course in Production Methods

G. W. Prentiss & Co. of Holyoke, Mass., has inaugurated a plan of training for their foremen and other factory supervisors. A group of 25 men has been formed to take a three months' course in modern production methods, which comprises the study of special text units, the solution of problems relating to the units, and the discussion of this material. There will be six biweekly meetings held after hours in the plant.

At each meeting a lecture will be delivered by an experienced production man and the lectures will be followd by a round-table discussion. Included in the group, besides foremen, are the general manager and the superintendent. The subjects to be studied are: How to promote team work in the shop; handling men in a way to increase production and promote harmony; how production should be organized; efficient purchasing, scheduling, routing, repairing, etc.; keeping down the overhead by stricter cost keeping; major problems of management.

The course is under the direction of the Business Training Corp., New York, which supplies the study material and the class instruction.

Employment Increasing in Great Britain

The October issue of the *Labour Gazette*, published by the British minister of labor shows that 14,617 men were employed in mining iron ore

in Great Britain in September, an increase of 0.5 per cent over the previous month and 1.1 per cent over the month last year.

British imports of iron ore in September amounted to 266,385 tons, or 403,353 tons less than in August, and 263,017 less than in September, 1913. Exports of pig iron in September amounted to 32,380 tons, 2099 more than in August, but 74,145 tons less than in September, 1913.

In the iron and steel works, employment throughout most of the month was good, although in some districts unemployment was caused by the strike of iron molders. Steel works were partially closed down in Ebbw Vale and Dowlais districts of South Wales, in consequence of a strike of craftsmen. An insufficiency of puddlers was reported in Scotland, and a few firms in other districts reported a scarcity of labor. A shortage of coal was reported by several firms. In the last days of September and the beginning of October many works closed in consequence of the railroad strike, and considerable unemployment resulted.

According to returns relating to 110,715 workers the aggregate number of shifts at the steelworks during the week ended Sept. 27 was 609,918, an increase of 3 per cent over the previous month, but a decrease of 4.1 per cent from a year ago. The average number of shifts worked was 5.51 as compared with 5.50 in the previous month, and 5.72 a year ago. Returns from firms employing 84,659 workers in September showed an increase of 17,512, or 26 per cent in the number employed as compared with September, 1913.

In the engineering trades, employment was fairly good, but toward the end of the month it became adversely affected by the railroad strike and the strike of iron molders.

In the tin plate and steel and galvanized sheet trades employment was better than a year ago. British exports of tinned and galvanized plates and sheets in September amounted to 47,746 tons, or 10,540 tons less than in August, 1919, and 52,390 tons less than in September, 1913.

Sheet and Tin Workers' Wages Unchanged

No change was made in wages of sheet and tin mill workmen at the bimonthly settlement in Youngstown, O., Nov. 11. James H. Nutt, representing the manufacturers, and M. F. Tighe, president of the Amalgamated Association of Iron, Steel and Tin Workers based the settlement on 4.35c per pound for sheets and $6.90 per box for tin plates. The following gives the percentages in wage changes for sheet workers made since Jan. 1:

November-December	4.35	Unchanged
September-October	4.35	Unchanged
July-August	4.35	— 4½ per cent
May-June	4.50	—10 per cent
March-April	4.90	—10½ per cent
January-February	5.25	+ 7 per cent

Schneider is Honored

Charles Eugene Schneider, the French steelmaster and chairman of the French delegation now touring this country in conjunction with other foreign trade missions, received the honorary degree of doctor of science from Western Reserve university at Cleveland, Nov. 14. Samuel Mather, vice president of the board of trustees of the university, presented M. Schneider, and in that connection said:

"Schneider has been a name to conjure with in French metallurgy for over a century, and especially during this recent war. Schneider & Co.'s steel works at Creusot, France, have been the mainstay for the output of weapons and munitions of war, serving not France alone, but also furnishing our own armies in France with a larger part of its artillery. But this firm, under its able management, has been distinguished not alone for its achievements in the steel world, but for its relations with its employes for over half a century. This large steel establishment, the largest in France, has taken a personal interest in its employes, and has conducted a wonderfully effective welfare system, its interest not being confined to the well-being of its workmen only, but also to the health and happiness of the wives and children of its employes. As a result, strikes have been unknown at this plant for more than a generation."

Business Editors Join

Sixty-seven editors and editorial representatives of business papers meeting at the Hotel Astor, New York City, Nov. 13, took steps to organize the National Conference of Business Paper Editors. Practically all the leading business and technical business papers of the country were in attendance upon the conference and have become affiliated with the new organization. In the election of officers, A. I. Findley, editor of *The Iron Age,* New York, was made president; Clay Cooper of *Mill Supplies,* Chicago, vice president, and R. Dawson Hall, managing editor, *Coal Age,* New York, secretary and treasurer. The executive committee consists of Julian Chase, editor and business manager, Class Journal Co., New York; B. O. Hough, *American Exporter,* New York; Mr. McQuilkin, *National Builder,* Chicago; E. T. Howson, editor, *Railway Maintenance Engineer,* Chicago; C. J. Stark, editor, THE IRON TRADE REVIEW, Cleveland; and Harvey Whipple, managing editor, *Concrete,* Detroit.

The purpose of the new organization is to provide closer contact among the editors of business publications of the country, and active co-operation along those lines which are of common interest. It is provided that three meetings a year will be held by the conference, one of which will be in connection with the annual meeting of the Associated Business Papers, Inc., with which the new organization is to be closely affiliated.

Tax on Manganiferous

A considerable reduction has been made in the assessed tax rate on the manganiferous ore properties of the Cuyuna range by the Minnesota tax commission. The assessments as equalized by Director of Mines Rukard Hurd for 1918 and 1919 are as follows:

Property	May 1, 1919	May 1, 1918
Algoma	$0.15	$0.75
Ferro	.15	.75
Joan No. 4	.15	1.00
*Merritt No. 1	.15	.75
Sultana	.15	.50
*Cuyuna-Mille Lacs	.10	.50
*Hopkins	.6	.50
Clark	.6	.50
Joan No. 3	.6	.20
*Ida Mae	.6	.20
*Preston	.6	.35
Mangan No. 1	.6	.75
*Mangan No. 2	.3	.60
Northland	.3	.15
Gloria	.3	.35
*Arko	.3	.10
Zeno	.1	.10

*The properties also contain tonnages of iron ore all now assessed at 3 cents per ton.

Fifty cents per ton was assessed against the manganiferous ore in stock pile May 1, 1919 at the Algoma, Ferro, Joan No. 4, Merritt No. 1 and Mangan No. 1 properties. Twenty-five cents per ton was assessed against the manganiferous ore in stock pile May 1, 1919 at the Sultana, Cuyuna-Mille Lacs and Hopkins properties.

Installs New Bar Mills

plant of the Hammond Steel Co., Solvay N. Y., now are nearing completion. The new steel-mill building, which parallels the old steel-making department, houses a 10 and 16-inch bar mill, straightening rolls and turning equipment. Additional annealing and electric-melting equipment also has been installed. After the new bar mills are placed in operation, the officials of the company will break ground for the erection of a new cold-drawing plant. The products of the company include hammered and rolled-alloy steel, die blocks and special forgings.

Men of the Iron Trade

Personal News of a Business Character Regarding the Men of Affairs of the Industry

W. A. McCALLUM, who has been assistant to the vice president of the Canadian Tube & Iron Co. and assistant to the president of the Canadian Rolling Mills and the Colonial Wire Mfg. Co., Montreal, has resigned from these positions to accept the office of vice president of F. E. Smith, Ltd., Montreal and Toronto, Ont., a firm doing a large domestic and foreign business in iron and steel refractories.

T. W. Allison, president of Allison & Co., Chester, Pa., sailed recently for England on a business trip.

R. B. Isner has been made purchasing agent for the Boone County Coal Corp., at Sharples, W. Va. The corporation operates 11 mines in the Coal river field.

William L. Niekamp, president of the Beck & Corbett Iron Co., and a director of the St. Louis Screw Co., has been elected a director of the United States Bank of St. Louis.

Capt. Charles B. Carter, who has been connected with the Chicago Steel Foundry, Chicago, since his return from military service in France, has been made sales manager.

J. Palmer Barstow has been elected president and treasurer of the reorganized Barstow Stove Co., Providence, R. I. Mr. Barstow also is president of the Flint Realty Co., Worcester, Mass.

W. S. Atwood, for many years assistant to the president, and A. D. Neal, purchasing agent of the Canadian Car & Foundry Co., Montreal, have been chosen vice presidents of the company.

J. E. Fries, chief electrical engineer of the Tennessee Coal, Iron & Railroad Co., Birmingham, Ala., will present a paper at the November meeting of the Association of Iron and Steel Electrical Engineers Saturday evening, Nov. 22, at the Chatham hotel, Pittsburgh. The subject of the paper is "Influence of Gear Ratio on Speed of Operation, Motor Heating and Tractor Wear in Auxiliary Steel Mill Drives."

A. W. Swan, who has been associated with the Canadian Ingersoll-Rand Co., Sherbrooke, Que., for the past two years, has resigned to take the position of assistant secretary for the Engineering Institute of Canada, in the head office at Montreal.

William P. Day, president of the International Steel Tie Co., is president of the Union Finance Co., just organized at Cleveland. C. E. Stuart, secretary-treasurer of the Central Steel Co., Massillon, O., is vice president of the company.

Sir John Gibson, president of the National Steel Car Co., Hamilton, Ont., is retiring from that position on account of the company having been acquired by American interests. He has been identified with the company since its inception.

Dr. George G. Davis, assistant professor of surgery at Rush Medical college and associate attending surgeon at the Presbyterian hospital, Chicago, has been appointed chief surgeon of the Illinois Steel Co., that city, to succeed Dr. James Barry, deceased.

Fred P. McLlyar, who was hot mill foreman at the Guernsey works of the American Sheet & Tin Plate Co., Cambridge, O., has assumed the position as superintendent of the Newton Steel Co., Newton Falls, Ohio. He had been with the Guernsey works about 17 years.

E. L. Hershey, formerly superintendent of the Irondale Furnace Co., Irondale, Wash., now is research chemist for the Claussen Chemical Co., Hadlock, Wash. Mr. Hershey had been actively connected with blast furnaces for many years in the east before he went to the Pacific coast.

H. H. Vaughn has retired from the executive staff of the Dominion Bridge Co., Montreal, to take more active interest in the operations of Armstrong, Whitworth of Canada, Ltd., of which company he recently was appointed a director. Mr. Vaughn also is actively interested in the recently organized General Combustion Co.

W. Hume Logan, of the Dow Wire & Iron Co., Louisville, Ky., has launched the American Federation of Business Men. The 10,000,000 business men of the United States all are prospective members, he claims. The aim is to protect and uphold Americanism from the onslaughts of labor radicals, "reds" and to protect and guard from intimidation honest workingmen.

J. Leonard Replogle, director of the steel supply of the war industries board during the war, has been decorated with the Belgian order of the crown, at the order of King Albert of Belgium, in recognition of his work in connection with the allotment of steel supplies to foreign governments. The decoration was delivered by a Belgian vice consul for Baron de Cartier, the Belgian ambassador.

F. B. Lounsberry, metallurgist of the Atlas Crucible Steel Co., Dunkirk, N. Y., presented a paper illustrated by motion pictures on the manufacture and subsequent heat treatment of high speed steel at a joint meeting of the Pittsburgh chapters of the American Steel Treaters' society and the Steel Treaters' Research society which was held at the General Forbes hotel, Pittsburgh, Monday evening, Nov. 17.

Frank W. T. Amis has resigned from Pilling & Crane, Philadelphia, for whom he was New York manager for 15 years, to accept the position of New York manager for Gueret, Jacks & Partners, Inc., 52 Broadway, New York City, which is a combination of ship operating and chartering companies with dealers in coal, iron and steel products. Offices are at 52 Broadway, New York City and at Seattle. Mr. Amis also formerly represented the Nova Scotia Steel & Coal Co., Ltd., and its subsidiary, the Eastern Car Co., Ltd., Canada.

C. F. Neudorfer, formerly general plant superintendent for the Standard Tank Car Co., Masury, O., has been made general manager. N. L. Mabey, chief engineer for the last two years, becomes assistant general manager, Frederick Burroughs, former chief estimator, has been made chief engineer, while J. W. Todd, who has been assistant chief engineer becomes assistant purchasing agent in the office of J. T. O'Connor, former superintendent of transportation, who has been made purchasing agent. J. R. Sweeken succeeds Mr. O'Connor as superintendent of transportation.

Men of the Machinery Trade

Personal News of a Business Character Regarding the Men of Affairs of the Industry

LLEWELLYN R. DUFFIELD recently was appointed manager of the machinery branch of the international exposition of industries at Grand Central palace, New York, in charge of factory appliances, mining industries and production machinery expositions. He formerly was in charge of the exhibition department and salesroom of the Philadelphia bourse, which was one of the most successful and best known machinery exhibitions in America. In joining the force of department managers at Grand Central palace, Mr. Duffield brings 20 years of experience in machinery and scientific fields to the world market project which is being financed by Alfred I. du Pont. The object of the international exposition of industries is to exhibit and sell American manufactured products in America and abroad. There are six branches comprising municipal equipment, machinery and mining industries, factory appliances and tractor, trailer and farm implement and hardware and housefurnishing exchanges and expositions.

Benjamin F. Curtis, traffic manager of the Norton Co., Worcester, Mass., has been elected president of the Worcester Traffic association.

Eldon McLeod, treasurer of the Mason Regulator Co., Boston, and trustee of the Florence Mfg. Co., has been elected a director of the Exchange Trust Co., Boston.

Wilmot L. Matthews and Stephen Haas, both of Toronto, Ont., have been elected directors of the Canadian General Electric Co.

Harry Mills, elected as labor member for Fort William, Ont., has been appointed minister of mines in the new administration of Ontario which assumed office on Nov. 14.

R. Sanford Riley, president of the Sanford Riley Stoker Co., Worcester, Mass., has gone to the Hot Springs of Virginia to attend a meeting of the American Stoker Manufacturers' association this week.

Henry D. Sharpe, president and treasurer of the Brown & Sharpe Mfg. Co., Providence, R. I., is a member of the committee in charge of building a large modern hotel in Providence.

M. W. Chipman, formerly with the Lynn, Mass., plant of the General Electric Co., has become president and general manager of the recently organized Lynn Machine & Screw Co., Lynn, Mass.

Joseph R. Nystrom sailed from New York, Nov. 15, for Europe as the foreign representative of the Graton & Knight Mfg. Co., Worcester, Mass. He will visit England, Sweden, Russia, Belgium, Holland, the Netherlands and other European countries, and expects to be away two years.

LLEWELLYN R. DUFFIELD

J. A. Corcoran, of the General Electric Co., Lynn, Mass., will be the principal speaker at the annual meeting of the Massachusetts States Association of Electrical Contractors and Dealers at the Bancroft hotel. Worcester, Mass., Dec. 3, the opening day of the Worcester electrical show.

Robert S. Parks, treasurer of the Parks-Cramer Co., Fitchburg, Mass., has been appointed publicity director for the campaign to raise a fund of at least $2,000,000 as an endowment for the Worcester Polytechnic institute, Worcester, Mass. Mr. Parks is a graduate of the institute, class of '93.

R. M. Rook, who for the past five years has been associated with the Metal & Thermit Corp., Equitable building, New York City, has been appointed general foreman of the St. Lawrence Welding Co., Montreal, Que. T. W. Rogers also has become affiliated with the St. Lawrence company in the capacity of general sales agent.

Frank L. Klingensmith, vice president of the Ford Motor Co., Detroit, has left for an extended tour of Europe and Ford automobile distributing branches abroad. He will investigate the possibilities of the tractor business

Carl I. Overton, formerly treasurer of the Bowen Products Co., Detroit, has resigned to become connected with the Alemite Co., of Chicago, manufacturers of automobile parts.

John L. Bender resigns as sales manager of the Anderson Forge and Machine Co. to join the C. A. S. Engineering Co., Detroit, which has just completed arrangements to represent the Pollak Steel Co., which operates plants at Cincinnati and Marion, O., and Chicago. This company produces light and heavy forgings for automobiles, locomotives, engines, machinery, etc., as well as rolled products.

Charles F. Scribner, formerly industrial engineer for the Colt's Patent Fire Arms Mfg. Co., Hartford, Conn., and more recently consulting engineer for L. V. Estes, Inc., Chicago, has become affiliated with the Business Service Corp. of America, 29 South La Salle street, Chicago, engineer and accountant, in the capacity of vice president and chief engineer.

Edward M. Woodward, president and treasurer of the Woodward & Powell Planer Co., Worcester, Mass., celebrated his seventy-third birthday anniversary Nov. 11. He organized the company in 1887 and has been active in its management since. Mr. Woodward was the third president of the National Machine Tool Builders' association and a former president of the National Metal Trades association.

Tractor Contract

Made by Quebec Government to Supply Them to Farmers at Cost

Toronto, Ont., Nov. 17.—The Quebec government has closed a contract with the Cleveland Tractor Co., of Canada, the plant of which is located at Windsor, Ont., for an unlimited number of tractors. The government will act as distributor and will sell the tractors at cost to any farmer or farmers' club wishing to purchase. The object in view is to promote the use of tractors on farms and keep the young men on the land by making their work easier.

The Algoma Steel Co., of Sault Ste. Marie, Ont., has received sufficient orders for rails and structural steel to keep the mill in operation six months. Large orders have been placed by the Canadian railroads for rails for replacements and repairs delayed by the war. The structural mill is now in steady operation making structural shapes up to 15 inches, whereas formerly six inches was the limit in Canada. The manufacture of alloy steels, for which the automobile industry offers an important market, has been commenced.

The Canadian railway war board will cease to exist Dec. 1. Because of what it was able to accomplish in the way of co-ordination and increased efficiency the organization will be continued under the name of the Railway Association of Canada, which will assume the functions of the war board, with practically the same officials: Lord Shaughnessy, honorary chairman of the war board, and Howard G. Kelley, of the Grand Trunk railroad, chairman of the executive committee will fill the same offices in the new organization, which will represent 94 per cent of the total railroad mileage of Canada.

Sir Henry Pellart, a prominent Toronto financier is to sail soon for England on business understood to be in connection with negotiations for the acquisition by British capitalists of a large interest in the Dominion Steel Corp.

The Laco-Phillips Co., manufacturer of tungsten lamps, has applied to the Canadian Board of Commerce to have the Canadian General Electric Co. declared a combine and ordered to sell to the applicant at a reasonable price tungsten wire required for use in the manufacture of electric lamps. The applicant's claim that the General Electric company having a monopoly under its patent, may force the Laco-Phillips company out of business. On behalf of the General Electric company, it is urged that the combines and fair prices act is designed only to protect the public and not the rival producer.

It is officially announced that next season engineers in the employ of the Canadian and British Columbia governments will investigate iron ore deposits on the Pacific coast. Representatives of an English steel firm in the meantime are making a private investigation, and have intimated that if the deposits prove to be as rich as stated they are prepared to finance iron and steel works in the neighborhood of Vancouver and build a railroad to make the deposits accessible. W. M. Brewer, a provincial government engineer, estimates that there are deposits of 50,000,000 tons, free from phosphorus or other deleterious substances.

Obituaries

ANDREW JACKSON BOYLE, aged 74, one of the pioneers of the iron and steel industry, died Nov. 16, at his home in North Braddock, Pa., from heart failure. He was born in Johnstown, Pa., Feb. 12, 1846, and was a son of Robert Boyle, for many years an official at the plant of the Cambria Iron Co. Mr. Boyle became a roller at the Cambria mills and in 1873 left Johntown and went to Braddock, where he took charge of the rolls at the rail mills built there by Andrew Carnegie and Capt. William R. Jones. In 1884 he became night superintendent of the steel department of the Edgar Thomson plant and held that position until he retired about 13 years ago.

Napoleon Fournier, foundry superintendent for the Wright-Martin Aircraft Corp., New Brunswick, N. J., died in his home in that city, Nov. 9, aged 52.

Lester R. Spencer, aged 35, secretary and treasurer of the Troy Metal Products Co., Springfield, O., died recently at his home in Piqua, O., following an operation for appendicitis.

Charles Dallett, who for 28 years had been connected with the W. P. Dallett Co., Indianapolis, machinery dealer, in an important capacity, died Nov. 5, at his home in that city, aged 49.

J. J. Fisher, a director of the Parkersburg Iron & Steel Co., Parkersburg, W. Va., and a conspicuous figure in the oil industry, died at his home in Pittsburgh, Nov. 12. He was 81 years old and a native of Pittsburgh.

Charles E. Alcorn, day superintendent of the Weirton, W. Va., plant of the Weirton Steel Co., died at the Ohio Valley hospital, Steubenville, O., Nov. 11, as a result of blood poisoning following an operation. He was 40 years old and made his home at Hollidays Cove, W. Va.

William T. Woodruff, former president of the Seth Thomas Clock Co., Thomaston, Conn., died at his home in that town Nov. 5, aged 80 years. He entered the employ of the company in 1868, and by gradual steps he rose from one position to another until he became president which office he filled for 23 years, resigning Jan. 1, 1915.

George E. Wilbur, for many years president of the Weir Stove Co., Taunton, Mass., died at his home in that city, Nov. 5, aged 79 years. He was one of the founders of the company 40 years ago which later became the largest industry of its kind in New England. He began his business career as a machinist and patternmaker.

Silas Emerson Harthan, a retired mechanical engineer and inventor, died at his home in Worcester, Mass., Nov. 5, aged 81 years. Mr. Harthan invented the Bigelow heeling machine, which was the basis of several fortunes in the show business, introduced the first electric lights in Worcester, and operated the city's first electric railway. He had a part in constructing about 50 steamboats during his life.

Wallace E. Sawin, treasurer of the Holyoke Water Power Co., Holyoke, Mass., who had a national reputation as an authority on hydraulic engineering, died while attending a funeral in that city, Nov. 7, aged 53 years. He entered the employ of the company in 1887 as draughtsman, later becoming engineer, then chief engineer, corporation clerk and assistant treasurer, being elected treasurer in 1913. He designed and had complete supervision of the Holyoke dam.

Steel Club

Made Up of Philadelphia Sales Managers Holds Initial Dinner

Philadelphia district sales managers assembled with their guests at the Ritz Carlton hotel at Philadelphia Friday evening, Nov. 15, for the initial dinner of the Steel club. This body was organized about eight months ago and its 30 members include representatives of all but two of the steel companies having offices in Philadelphia. The object of the club is to promote the good feeling which always has existed in the steel fraternity in and around Philadelphia, and as a result of this good feeling, to foster clean and friendly competition. It is felt by its members that the Steel club of Philadelphia is a worthy adjunct to the American Iron and Steel institute in fostering good will among competitors as well as respect for, and confidence in, the steel industry, on the part of consumers.

Meetings of the Steel club have taken the form of monthly luncheons, followed by golf. Last night's dinner, which probably was the first of a series of similar affairs to be held annually, was free of speeches and all formality and was devoted to good fellowship and entertainment. Arrangements for the program were made by William L. Hoffman, Philadelphia district sales manager for the Brier Hill Steel Co., who is president of the club. Frank Jones, Eastern Steel Co., Philadelphia, the only other officer, is secretary and treasurer. The membership of the club made up of sales managers of Philadelphia and vicinity is as follows:

Craig Adair, manager sales, Penn Seaboard Steel Corp., Philadelphia.

William Breeden, manager sales, Lackawanna Steel Co.

S. J. Cottsworth, manager sales, Lorain Steel Co.

G. Clinton Fogwell, manager sales, Jones & Laughlin Steel Co.

W. L. Fotterall, Republic Iron & Steel Co.

H. B. Gaylord, manager sales, Carpenter Steel Co.

F. H. Gordon, general manager sales, Lukens Steel Co.

C. O. Hadley, general manager sales, Alan Wood Iron & Steel Co.

William L. Hoffman, manager sales, Brier Hill Steel Co.

Frank W. Jones, manager sales, the Eastern Steel Co.

Walter B. Kennedy, manager sales, Bethlehem Steel Co.

Paul M. King, manager sales, Worth Steel Co., Claymont, Del.

Frank J. Krouse, manager sales, Cambria-Midvale Steel Co.

A. B. Miles, Brier Hill Steel Co.

H. S. Moore, manager sales, Central Iron & Steel Co.

William H. Oliver, manager sales, Republic Iron & Steel Co.

LeRoy Richards, manager sales, Nagle Steel Co.

Henry Rose, manager sales, American Steel & Wire Co.

W. S. Stephenson, manager sales, American Rolling Mills Co.

G. T. Shants, manager sales, Lukens Steel Co.

T. W. Simpers, manager sales, American Sheet & Tin Plate Co.

L. R. Steuer, Cambria-Midvale Steel Co.

S. H. Truitt, manager sales, LaBelle Iron & Steel Co.

H. G. Uphouse, manager sales, Donner Steel Co.

Ray P. Farrington, Trumbull Steel Co.

A. H. Cordery, general manager sales, Phoenix Iron Co.

Frank Wallace, manager sales, Central Steel Co.

Lee R. Stewart, manager structural sales, Bethlehem Steel Co.

John E. Wetzel, manager sales, Superior Steel Co.

H. Lindley Crowther, manager sales, Sharon Steel Hoop Co.

Forms Exclusive Agency

Furnaces of the Thomas Iron Co., Hokendauqua, Pa., are to be altered and repaired and an annual capacity of approximately 350,000 tons is anticipated. The product of the furnaces is to be handled exclusively by E. Arthur Tutein, Inc. Mr. Tutein, head of the new sales organization, formerly was the company's Boston agent for several years. The Boston office remains at 50 Congress street, and is in charge of Hubert A. White. The New York office, formerly at 90 West street, now has been established under the new regime at 25 Broad street, in charge of Dexter A. Tutein. The Philadelphia office, formerly at 626 Stephen Girard building, now is located in the Finance building and is in charge of Water A. Barrows 3rd, as representative of E. Arthur Tutein, Inc.

Stone Companies Join

Youngstown, O., Nov. 17.—A deal has been closed whereby the Bessemer Limestone Co., with extensive quarries at Bessemer, Pa., about 15 miles south of this city, will consolidate with the Bessemer Limestone & Cement Co., and after Jan. 1, 1920, will be under the latter name. A cement plant, which will have a capacity of 3000 barrels per day, will be built nearby the Bessemer quarries. Plans for the new plant are being prepared by the Allis-Chalmers Co., Milwaukee. The equipment will include three rotary kilns, a powdered-coal plant and crushing and grinding machinery. The Bessemer Limestone Co. will continue to distribute its product which includes agricultural limestone, crushed stone for road building and limestone for fluxing purposes. A large percentage of the limestone used at the blast furnaces in the Mahoning and Shenango valleys is shipped from the Bessemer quarries. The officers of the Bessemer Limestone & Cement Co. are: Joseph G. Butler Jr., chairman of the board of directors; John Tod, president; F. R. Kanengeiser, vice president and general manager; G. G. Treat, secretary; and J. R. Rowland, treasurer.

Prices Are Advanced

Prices on cast iron boilers and radiators have been advanced 7½ per cent, and all accessories such as valves and pipe fittings have been advanced from 5 to 25 per cent. The general increases were made necessary, it is explained, by the recent advances in pig iron and fuel. Demand for these products is reported good, with a shortage of production. Dealers point out that prices still are below the level of war times. Radiation stock which now is bringing 34 cents a foot was 40 cents at the time of the armistice, and before the war was 17 cents.

Corporation Is Changed

Birmingham, Ala., Nov. 17.—The Chickasaw Shipbuilding & Car Co. has filed articles of incorporation at Mobile, as the successor to the Chickasaw Shipbuilding Co., the subsidiary organization of the Tennessee Coal, Iron & Railroad Co. The new corporation takes in the Fairfield works, the steel fabrication plant at Fairfield, in the immediate Birmingham district. This change in the title and scope of the Chickasaw corporation is believed to be a matter of considerable significance in the future development of this enterprise. The first steel ship of the Chickasaw Shipbuilding Co. will be launched early in December. The concern has contracts for a large number of steel ships, several months work being assured.

To Present Gold Medal

A reception and dinner is to be tendered Eugene Schneider, head of Schneider & Co., who operate the Creusot and other steel works in France, by the Mining and Metallurgical Society of America, at the Hotel Biltmore, New York City, Monday evening, Nov. 24. The reception will take place at 6:45, followed by the dinner at 7:15 p. m. On this occasion the Mining and Metallurgical society will present Mr. Schneider with its gold medal. Speakers at the dinner will be as follows: Bradley Stoughton, Henry M. Howe, Charles M. Schwab and Col. Manus McCloskey of the United States army.

Here and There in Industry

Live Information Which Records the Expansion of Various Lines of Productive Enterprise

REPRESENTING a merger of four companies, the Republic Tool & Mfg. Co. has been formed at Cleveland. It succeeds the Cleveland Power Transmission Co., the Diamond Stamping Works and the Clyde E. Lowe Co., Cleveland, and the Detroit Reamer & Tool Co., Detroit. The new company acquires from the Clyde E. Lowe Co. basic patents on pressed steel cores and steel mandrels used in the manufacture of automobile castings and tubes for tires. Plans have been formulated for increasing production at the Diamond Stamping Works. The Cleveland Power Transmission Co. will become a jobbing unit for mill equipment of all kinds, including small tools, steel and factory supplies. The Detroit Reamer & Tool Co. will continue the production of small cutting tools and will sell its products to jobbing and manufacturing companies. Proceeds from preferred stock after paying for the properties will be used in the extension of the Cleveland and Detroit plants. Clyde E. Lowe is president; B. V. Selby, vice president, and D. A. Clark is consulting engineer of the new company. These with the following constitute the board of directors: Charles H. Beardslee, vice president and general manager of the Fate-Root-Heath Co., Plymouth, O.; Harry W. Kellar, treasurer, Standard Scale & Supply Co.; E. H. Krueger, Cleveland; Elmer E. Lenarz, Cleveland; and Herman J. Nord, secretary, the Oriente Sugar Co.

* * *

OFFICERS of the Federal Tool Co., 453 Michigan avenue, Detroit, were elected at a recent meeting, as follows: President, Joseph Larkin; treasurer, Matthew Finn, and secretary, Thomas Tierney. At this meeting, it was decided to build a plant before the end of the present year, on Apple street, Detroit. The company is capitalized at $72,000.

* * *

THE American Forge & Machine Co., Canton, O., manufacturer of pressed or hammered steel forgings, open-hearth, vanadium or chrome nickel steels, etc., recently added another steam hydraulic forging press to its forge shop equipment. This addition enables it to take care of a wide range of forging work, with increased facilities for rough machining and heat treating.

* * *

THE National Roll & Foundry Co., Avonmore, Pa., has received the contract for the sheet mill installation at the new plant of Follansbee Bros. Co., at Toronto, O., consisting of 10 roughing mills, 10 finishing mills, 10 stands of cold rolls and the necessary equipment, as well as a complete 28-inch, 2-high reversing sheet bar mill, including tables and cooling bed. The company also is building the hot mill equipment for the Eastern Rolling Mill Co., Baltimore.

* * *

ORGANIZED to manufacture screw machine products, the Lynn Machine & Screw Co., Lynn, Mass., now is installing necessary machinery in the building of the Matson Hoyt Machine Co., which it purchased together with equipment. Thirty new automatic screw machines have been purchased and will be added to the present equipment. M. W. Chipman, formerly with the General Electric Co., at Lynn, is president and general manager of the new company and A. M. Hoyt is vice president.

* * *

ALBERT F. ROCKWELL, Bristol, Conn., has been elected president of the $8,000,000 corporation, the Standard Steel & Bearings, Inc., which is a consolidation of the Marlin-Rockwell interests. It will operate the plants in Philadelphia and Braeburn, Pa., New Haven, Plainville and Norwich, Conn. T. C. Fogel, George L. Sanford, Hugh M. Rockwell, F. M. Germain and George H. Neilson are vice presidents; and H. C. Pryor is secretary and treasurer. Directors are A. F. Rockwell, Edgar Park, T. C. Fogel, George L. Sanford and H. C. Pryor.

* * *

FRED J. FISHER, president of the Fisher Body Corp., Detroit, was elected president of the Fisher Body Ohio Co., Cleveland, at a meeting held last week in that city. Charles F. Fisher was elected vice president; L. Mendelsohn, treasurer, and A. Mendelsohn, secretary. Directors include E. F. Fisher and A. J. Fisher, of Detroit, and L. Fisher Sr., of Norwalk, O. Grovener Hutchins, Hallgratten & Co., New York; John Sherwin and Joseph R. Kraus, the First National bank; Frank H. Ginn, member of the law firm of Tolles, Hoggsett, Ginn & Morley; Charles A. Otis, Richard Inglis and C. V. Crowther, of Otis & Co., and Norris J. Clarke, of the Lake Erie Bolt & Nut Co., all of Cleveland.

* * *

CAPITALIZED at $75,000, the Jones Bros. Structural Steel Co., Ravenna, O., recently was incorporated to take over the business formed as a partnership several months ago by J. A. Jones and B. F. Jones, formerly of the Alliance Structural Co., Alliance, O., and G. G. Jones, formerly of the Penn Bridge Co., Beaver Falls, Pa. The new company will take over the plant, which is completely equipped for the fabrication of all kinds of structural steel. No plant extensions are contemplated before next spring. The plant now is in full operation and more business is being booked daily. Officers of the company are: President, J. A. Jones; vice president, G. G. Jones; secretary, B. F. Jones, and the board of directors composed of the officers and V. W. Filiatrault.

* * *

THE Ohio Heating & Pipe Bending Co., 1063 West Eleventh street, Cleveland, has advised that it has increased its capital to $250,000, for the purpose of erecting a new building and installing additional power apparatus and machinery, including several lathes. The company also plans to enlarge its stock of pipe and fittings and will equip in a small way for ship chandlery. The firm has established a marine department and is in addition carrying a department for heating and ventilating, pipe bending and the fabricating of pipe, etc. The marine department will care for the piping of vessels, supplying equipment and do repair work on steamers. The company also plans to install a power construction department. B. Waller Neyhard is secretary and treasurer.

Here and There in Industry

Live Information Which Records the Expansion of Various Lines of Productive Enterprise

PURCHASED property, 219 x 561 feet, at the northwest corner of Blackhawk street and Cherry avenue, Chicago, will be improved by the erection of a building with a floor area of about 200,000 square feet by A. M. Castle & Co., 715 North Morgan street, that city. The new property is located on the Chicago river and is served with a Chicago, Milwaukee & St. Paul railway switch. Two 7-story, two 3-story, two 2-story and two 1-story buildings now are located on the east half of the property and are leased to the Union Wire Mattress Co., for a number of years at $15,000 annually. A. M. Castle & Co. are warehouse distributors of finished steel products and also are engineers and manufacturers of hydraulic press steel work. The main plant is located on North Branch street and the river on a 4-acre site. The company also owns a block in Division street from Hooker to Hickory streets and the warehouse property at Morgan, Huron and Superior streets. An associate company, A. M. Castle & Co., of Washington, is located in Seattle by which the markets of China, Japan, India, Australia and Alaska, are reached.

* * *

AN ORDER received recently from the Missouri, Kansas & Texas railroad for two steam-driven, 20-ton locomotive cranes by the Exeter Machine Works, 30 Church street, New York, represents the second contract closed by this particular railroad. The first order called for the same number and size of cranes.

* * *

THE American Machinery Equipment Co., 1246 Penobscot building, Detroit, was recently organized as a clearing department for cranes, boilers, power plant equipment, new and second-hand machinery, etc. W. R. Gard, general manager, has announced that the company's operations will cover the entire east and central western sections of the country with branch offices in all the largest cities.

* * *

PLANS of the International Harvester Co., Chicago, practically to double the plant, the Chattanooga Plow Co., Chattanooga, Tenn., were announced recently by Judson Buchanan, local manager. They call for an addition to the main plant. Plans also are being made for a $10,000 building containing club rooms, cafeteria, locker rooms and gymnasium. The Chattanooga Plow Co. was purchased several months ago by the International Harvester Co., and manufactures chill plows, of various styles, and cane sorghum mills.

* * *

ANNOUNCEMENT has been made that the Interstate Steel Mfg. Co., Milwaukee, has purchased all of the machinery and equipment of the Bayley Structural Iron Co., 705-709 South Pierce street, that city. The plant will be operated on an enlarged scale. The Interstate company is developing a new department of its business in the manufacture of auto truck and tractor frames, bumper bars and radiator guards for auto trucks, fans, sheet steel tanks, etc. This is in addition to its regular line of structural iron and steel work. It also owns a patent on a new style of sidewalk lights.

* * *

WHAT is considered will be the largest and best equipped forging shop in the world is to be erected by the New Departure Mfg. Co., Bristol, Conn., in its extensive program to double the output of its plants in that city, Elmwood and Meriden, Conn. The forge shop is to be reinforced concrete and steel, one story, 126 x 405 feet, next to which is to be a 70 x 270-foot die, machine and tool building and a steel 75 x 240-foot storage building. The contract for the three buildings has been let. Other additions to the Bristol plant will include a 220-foot, with two 88 x 110-foot ells ball plant; a 110 x 220-foot annealing plant; a 2-story and basement, 48 x 64-foot pattern and carpenter shop; a 1-story, 30 x 30-foot addition to the engineering building; a 54 x 114-foot heating plant, with two 175-foot high stacks; a 2-story 40 x 132-foot addition to the power plant and a hospital building. A reinforced concrete, 3 and 4-story building will be erected at the Elmwood plant and two new buildings in Meriden. The work will take seven months, cost several millions and will mean employment for 9000.

* * *

SPECIAL machinery for the recently incorporated Hartford Tube Products Co., Hartford, Conn., already has been ordered for its new plant now being built at Elmwood, Conn., about 4 miles from Hartford, on the main line of the New York, New Haven & Hartford railroad. Other equipment not yet contracted for includes lathe, shaper, miller, grinder and drill for the tool room; two pipe machines up to 4-inch capacity; radial drill; ten 1 and 2-ton chain hoists; air compressor about 80 pounds with 300 cubic feet capacity; pressure blower; hydraulic pump with 1000-pound pressure and 1½-inch discharge; blacksmith shop equipment, etc. The company is capitalized at $200,000 and will manufacture coils and bends of iron and steel pipe for refrigerating, chemical and general manufacturing; copper and brass tube coils; ammonia receivers; hot water service heaters; feed water heaters, etc. Officers are: President and treasurer, Irving I. Ingraham; vice president and general manager, H. K. Herbinson, and secretary, J. P. Fitch.

* * *

THE steel mill of the Stanley Works, New Britain, Conn., now in process of erection, covers more ground space than any other factory in that city. The steel frame is being erected by the Berlin Construction Co., East Berlin, Conn., and covers an area of 300 x 700 feet, being three stories high. The roof is pitched from the center. The building is separated by a row of supporting columns in the center. Traveling cranes will be installed in the building. In addition, railroad tracks will run through the building connecting with the main line which will pass through the center of the building, going to other parts of the plant. The mill will be used to roll steel.

The Stanley Works is to open a branch factory in Springfield, Mass. It will transfer part of the packing and wrapping departments to the new branch because of inability to secure favorable space in New Britain.

Current Tax Rates Are Lower

Comparison of Taxes for Individuals and Partnerships Shows That the Outstanding Features of 1919 Revenue Measure Are Practically the Same as Last Year—Greatest Change in Normal Rates

INCOME TAX DEPARTMENT
Conducted by
WOLFF, MILLER & CO.
Certified Public Accountants
1326 Broadway, New York City

TAX rates for individuals for 1919 were prescribed by federal tax law of 1918. Although the normal tax rates for 1919 are lower than they were in 1918, the total tax for individuals will not be materially reduced, as the surtax rates for 1919 remain the same as for 1918. There has been some talk of reducing the tax rates for 1919, but financial requirements of the government, including the charges piled up by the war, are so great as to make necessary every dollar of revenue contemplated by the present law.

The outstanding features of the 1919 tax provisions are practically the same as for the year 1918, but one important modification is in the normal tax rates. On the first $4000 above the usual credit of $2000 ($1000 for single persons) the normal tax rate is 4 per cent. Everything in excess of the $4000 is taxable at 8 per cent. In 1918, the corresponding tax rates were 6 per cent and 12 per cent respectively. The surtaxes which are additional to the normal taxes are exempted for the first $5000, no credit of $1000 or $2000 being allowed. On the first $1000 after the exemption of $5000, the rate is 1 per cent, and then for every $2000 additional up to $100,000 the rate is increased 1 per cent, so that on an income of $100,000, the highest surtax rate reached is 48 per cent. For 1917, the surtax up to this amount reached only to 22 per cent. The total taxes payable in 1919 on taxable incomes ranging from $5000 to $1,000,000, after credit for exemptions, will exhaust from 3 per cent to 67 per cent of the total income. In 1916, such taxes exhausted from 5 per cent to 70 per cent of the total income.

The accompanying table shows a comparison between the taxes payable on various incomes, together with the percentages of income payable as taxes for 1918 and 1919. On the range, shown in the table, the reduction in 1919 taxes as compared with rates for 1918, is less than 10 per cent on a weighted average.

The table is applicable to individuals, including members of partnerships. Each partner as an individual is taxed on his share of the profits earned by the partnership, as shown by the partnership return, whether or not such profits have been distributed to the partners. If John Brown, a member of Smith & Brown, a partnership, has been credited with one-half of the profits of $50,000, or $25,000, he is taxed on $25,000, even though his drawings during the year have been only $10,000. This will mean that some business men will be under the necessity of drawing out a part of their profits for the purpose of meeting taxes.

Some of the important features of the 1919 tax provisions are as follows:

1. A single person with a net income of $1000 or over and a married person with an income of $2000 or over, must file a return.

2. The exemptions are $1000 for a single person, and $2000 for a married individual, or the head of a family, plus $200 for each child or dependent other than wife. A single person at the head of a family, earning say $1800 per annum, will have to file a return, although he will not have to pay any taxes.

3. Amounts received as interest on state or municipal bonds are exempt. Interest received on Liberty bonds are exempt only with certain limitations.

4. Losses incurred by individuals in transactions entered into for profit, though not connected with his trade or business are deductible from gross income. For example, a person earning $50,000 in his regular business, and losing $75,000 in Wall street would not have to file any return as he has not a net income. Under the 1917 law his income would have been considered as $50,000, on which figure he would be obliged to pay taxes.

5. Losses on personal loans are deductible from gross income.

6. The taxes are payable in four installments, as last year.

7. Individuals are permitted to file their returns on the basis of fiscal years, as in 1918, instead of on a calendar-year basis. Those individuals who have adopted a fiscal-year basis, will in computing their taxes for 1919 have to apply both 1918 and 1919 rates. No change may be made from fiscal year basis to calendar year basis unless with the approval of the commissioner of internal revenue.

8. A very important provision permits a taxpayer to deduct a net loss sustained in the year 1919. The provision follows:

"If for any taxable year beginning after Oct. 31, 1918, and ending prior to Jan. 1, 1920, it appears upon the production of evidence satisfactory to the commissioner that any taxpayer has sustained a net loss, the amount of such net loss shall, under regulations prescribed by the commissioner with the approval of the secretary, be deducted from the net income of the taxpayer for the preceding taxable year * * * the taxes imposed by this title and by title III for such preceding taxable year shall be redetermined accordingly. Any amount found to be due to the taxpayer upon the basis of such redetermination shall be credited or refunded to the taxpayer, in accordance with the provisions of Section 252. If such net loss is in excess of the net income for such preceding taxable year, the amount of such excess

Individuals' Tax Rates of 1918 and 1919

Income (exemption $1000)	1918 Normal tax	1918 Surtax	1918 Total	1919 Normal	1919 Surtax	1919 Total	Percentage of income payable as taxes 1918	Percentage of income payable as taxes 1919	Percentage of saving in 1919 taxes
$ 5,000	$ 240		$ 240	$ 160		$ 160	5	3	40
10,000	840	$ 110	950	560	$ 110	670	10	7	30
20,000	2,040	710	2,750	1,360	710	2,070	14	10	30
40,000	4,440	3,410	7,850	2,960	3,410	6,370	20	16	20
100,000	11,640	23,510	35,150	7,760	23,510	31,270	35	31	10
200,000	23,640	77,510	101,150	15,760	77,510	93,270	51	47	8
300,000	35,640	137,510	173,150	23,760	137,510	161,270	58	54	7
500,000	59,640	263,510	323,150	39,760	263,510	303,270	65	60	7
1,000,000	119,640	583,510	703,150	79,760	583,510	663,270	70	66	6

shall under regulations prescribed by the commissioner, with the approval of the secretary, be allowed as a deduction in computing the net income for the succeeding taxable year."

Fortunately, due to the rising prices of commodities, there are few individuals who will show net losses for 1919. This section should be extended by congress to cover future years, so that in a period of a declining price level, the business man will receive refunds for net losses.

Another important deduction now allowable is for losses in inventories. If it is shown to the satisfaction of the commissioner that during the taxable year 1919, the taxpayer sustained a substantial loss from a material reduction in the inventory valuation made at the end of the taxable year 1918, then the amount of such loss will be deducted from the net income for the taxable year 1918, and the tax for 1918 will be redetermined. Any amount found to be due to the taxpayer will be refunded or credited to him. This provision, too, is not very important just now, in view of the gradual rise in prices of most commodities during 1919. In this connection, the taxpayer must have his records in such shape so as to be able to convince the government of the validity of his claim. This provision is a fair one and should be applied to all years by amendment to the income tax law.

Charcoal Surplus Grows

Report of the Charcoal Iron Co. of America for the nine months ending Sept. 30 as issued at Detroit by President F. W. Blair, shows net profits of $306,427.17 and total accumulated surplus of $1,835,502.72 after payment of $213,304 in dividends. Assets of $13,233,296.01 includes $10,329,077 in property account; $2,823,121.76 of current assets and $81,096 deferred charges. Unfilled tonnage for charcoal iron as of Sept. 30 stood at 45,062 tons.

Increases Its Shares

Fisher Body Corp. stockholders have approved the proposed increase in the capital stock from 200,000 to 500,000 shares all common stock without par value. The decision of the directors to increase the number of directors to 15 and to amend the certificate of incorporation so that the amount of capital with which the corporation is to carry on business shall be $8,500,000 was also ratified. Any additional stock issued above the 500,000 may be issued and sold at $92 per share for common, it was decided. The plans adopted at the stockholders meeting open the way for carrying out the plan of the General Motors Corp. to secure a substantial interest in the Fisher Body concern.

Beginning New Series on Taxation

THE IRON TRADE REVIEW *has made arrangements with Messrs. Wolff, Miller & Co, 306 Broadway, New York, certified public accountants, for the preparation and publication of exclusive articles explanatory of the 1919 income tax law and internal revenue regulations, and their application to corporations, partnerships and individuals.*

These articles have been prepared by Mark Wolff and David Miller, both certified public accountants of New York state. They are authors of accounting literature, special lecturers to income tax deputies and expert accountants of many years experience.

Their articles on the application of the income tax law published by THE IRON TRADE REVIEW *last spring received widespread and favorable attention.*

The first article of the new series treats of the taxation of individuals and partners for 1919. The next article will explain the taxation of corporations.

Large India Order Leads to Amalgamation

The Cammell, Laird Co., one of the great steel interests of Sheffield, Eng., has amalgamated with the Midland Railway Carriage & Wagon Co., Ltd., a large Birmingham enterprise. One of its objects was to find more work for the great extensions already made and others approaching completion at the Cammell company's Penistone and Nottingham plants. The Penistone plant is a new steel works with a large capacity. At a recent meeting of stockholders of the Cammell company resolutions were adopted authorizing a division of 400,000 ordinary shares at £5 each into £1 shares, and £5 cumulative preferred shares into £1 cumulative preferred shares, and the increasing of the capital of the company to £4,000,000 by the creation of 750,000 ordinary shares of £1 each, which number of shares will be allotted to the shareholders of the Midland company.

At the meeting of the Midland company, at which the amalgamation was approved, the chairman, George Turner, said the company's relations with Cammell, Laird & Co., arose out of the financing of a big contract for rolling stock for India. While Cammell's undertook the financing of the business, it arranged to get the material from the Midland company and this will occupy a good portion of its capacity for some years.

To Vote on Increase

A meeting of stockholders of the Timken-Detroit Axle Co. will be held in Canton, O., Nov. 26 to vote on a proposal to increase authorized capital from $6,000,000 to $48,000,000. The plan provides for an increase of common stock from $3,000,000 to $30,000,000 and reduction of par value to $10 a share and for the issue of $15,000,000 of preferred stock in addition to the $3,000,000 outstanding.

Financial Crop Ends

THE Van Dorn Iron Works, Cleveland, is offering $650,000 of 7 per cent preferred stock at par. The finances of the company are being reorganized to place the common stock on a no par basis. Application will be made to list both the common and preferred stock on the Cleveland exchange, it is reported.

* * *

Dort Motor Car Co., of Flint, Mich., has increased capital from $2,000,000 to $3,500,000 and is expected soon to announce a new building program.

* * *

Contemplated purchase of the Fairbanks Co., Chicago, by the American Steel Foundries, Chicago, is reported. According to the plan, it is said Fairbanks company stock will be exchanged at the rate of one share for two and one-half shares of Steel Foundries.

* * *

Total net sales of the Republic Motor Truck Co., of Alma, Mich., and Torbensen Axle Co., of Cleveland, a subsidiary, for the three months ending Sept. 30 was $6,264,773. Net profits before federal taxes was $520,-903.

* * *

Studebaker Corp. stockholders will meet in Jersey City, Nov. 24, to vote on a proposal to increase authorized capital stock from $45,000,000 to $90,000,000 of which $75,000,000 will be common stock.

* * *

Stockholders of the Stewart Warner Speedometer Corp. at a special meeting in Richmond, Va., a few days ago approved the resolution of the directors to exchange new stock of no par value for outstanding stock of $100 par in ratio of four for one.

Tool Builders Make Users Wait

Much Deferred Deliveries Handicap Sellers—Some Buyers Postponing Action Until Jan. 1, 1920—General Electric Issues Inquiries for 200 Machines—Emergency Fleet Sells Tools—Bethlehem Steel Wants 11 Cranes

ALTHOUGH the usual end-of-the-year slowing down is not expected in the machine tool and equipment field at this time, because of the exceptional amount of building activity going on, a few users have announced their intention to wait until after Jan. 1, 1920, before placing orders on inquiries recently issued. This is true of the Firestone Steel Products Co., Akron, O., among others. Deferred deliveries are the rule both in the United States and Canada and this is cutting down sales volumes. Sellers believe they could close much attractive business if they could give suitable deliveries but machinery manufacturers are filled up for as much as five months ahead in some cases. Users therefore, are obliged to wait for needed equipment in various instances. In Pittsburgh, heavy equipment builders complain of a scarcity of cleaning-room labor in foundries which furnish them heavy castings. This is curtailing heavy equipment building.

Featured in the east, are the inquiries from the General Electric Co., Schenectady, N. Y. These now are said to aggregate 200 machines although little buying so far has been done. Action on other large lists issued recently is expected soon. Increased activity is noted in shipyards. The Union Shipbuilding Co., Baltimore, is to take much fabricating equipment; it will spend $4,000,000 on increased facilities. The National Concrete Boat Co. is to expend $500,000 on a new yard at Norfolk, Va. The Robert Dollar Steamship Co., New York City, will erect a $1,000,000 pier on Long Island. The Sun Shipbuilding Co., Chester, Pa., is in the market for 12 cranes.

A wide spread exists between crane inquiries and orders, few of the latter being taken. The Carnegie Steel Co. wants prices on several cranes and the Bethlehem Steel Co. is out for 11 machines for Lebanon, Pa. The Follansbee Bros. Co., Pittsburgh, which will require seven for Toronto, O., plant, has closed with the National Roll & Foundry Co., Avonmore, Pa., for the mill equipment. Several inquiries for single cranes are out.

Machine tools are moving at a steady rate in the Middle West. The Nash Motors Co. continues to buy for Milwaukee, as does the Samson Tractor for Janesville, Wis. The Allis-Chalmers Co. also is buying tractor plant equipment while the Chas. Stecher Co., Chicago, is adding to its automatic equipment. The largest inquiries in Cleveland come from the Lewis Steel Products Co., Toledo, O., and the Ellicott Machine Corp., Baltimore, for five tools each. About two dozen pieces of equipment are wanted by the Hartford Tube Products Co., Hartford, Conn., for a new plant at Elmwood, Conn.

The Emergency Fleet corporation is selling a large number of tools in different plants throughout the country. The senate and house finally has agreed upon 15 per cent as a selling price for tools to educational institutions. The ordnance department has taken over the plant built by the Symington-Chicago Corp., Chicago, to use as a center for disposing of equipment from various outside points.

Shipbuilding Projects to Take Much Equipment

THE General Electric Co. continues to issue inquiries for machine tools for its Schenectady, N. Y., plant. It is estimated now that its requirements total more than 200 machines. As yet, however, little buying of consequence has developed. Action on the other large lists which feature the eastern market also is pending, and the situation as a whole is quiet. Sentiment, nevertheless, remains strong. The larger buying interests in the market are expected to start closing any time and there is also considerable additional business in prospect. Included in the latter is equipment for the Union Shipbuilding Co., Baltimore, involving some fabricating machinery. The company plans to expend about $4,000,000 on new facilities.

Another shipbuilding project is that of the National Concrete Boat Co., calling for the expenditure of $500,000 for a new yard at Norfolk, Va. Of interest to the trade is a bill recently introduced in congress, specifying the creation of a $12,500,000 federal corporation to take over the government's nitrogen plants at Sheffield and Muscle Shoals, Ala., and to buy and build additional plants. The Hartford Tube Products Co., Hartford, Conn., is in the market for a lathe, shaper, miller, grinder, drill, two pipe machines, radial drill, 10 1 and 2-ton hoists, air compressors, pressure blower, hydraulic pump, blacksmith shop equipment, etc. Two large plant additions are to be erected at Buffalo by the Beaver Board Co. Some tool shop equipment, it is understood, will be required. The Newark Leather Machinery Co., Newark, N. J., is to build a 50 x 112-foot shop addition. The Torrington Co. is to erect an $80,000 addition to its Standard plant at Torrington, Conn. The Duratex Co., Newark, has awarded a contract for the erection of a machine shop addition. The Pennsylvania Forge Co., Philadelphia, will require equipment for a $30,000 rolling mill. The H. H. Franklin Mfg. Co., Syracuse, N. Y., plans to establish a new plant for the exclusive manufacture of motor trucks.

Outstanding among crane inquiries in the eastern market is a list of 11 cranes for the Lebanon, Pa., plant of the Bethlehem Steel Co. Specifications call for one 15-ton, 65-foot

EVERY BAR OF LUDLUM STEEL THOROUGHLY TESTED

Every bar of Ludlum Steel is fractured and carefully examined by an expert to see whether or not it is in proper condition. The Brinell hardness is taken, and if in accordance with specifications or requirements, it is straightened and shipped.

Such rigid care as this in every stage of manufacture, explains why *Ludlum Steels* are selected by the majority of large users and twist drill and milling cutter manufacturers in America.

We shall be glad to hear from you.

Prompt shipment from warehouse stock at Watervliet, N. Y.; Detroit, Mich.; Chicago, Ill.; or Cambridge, Mass., handled through our branch offices.

span; one 20-ton, 27-foot span; two 5-ton, 56-foot span; two 7½-ton, 66-foot span; and five 7½-ton cranes, with 50-foot span. Another large inquiry pending in the East, although likely to be closed very shortly, is that of the Sun Shipbuilding Co., Chester, Pa., calling for approximately 12 10-ton overhead cranes, with 100-foot spans. The Du Pont Engineering Co., Wilmington, Del., is inquiring for a 5-ton overhead crane, with 86-foot span. The Penn Cement Co., Nazareth, Pa., is in the market for an 8-ton crane, with 90-foot span. The Concrete Steel Co., 42 Broadway, New York City, is expected to close soon on a 5-ton overhead crane for Long Island City, N. Y.; and two overhead cranes of 7½ and 10 tons capacity, respectively, for Chicago. This company has recently bought a 20-ton locomotive crane from Orton & Steinbrenner.

It is thought likely that the New Departure Mfg. Co., Bristol, Conn., will be in the market for overhead crane equipment shortly. The company plans to spend several million dollars on plant extension at Bristol, Meriden and Hartford, Conn., and already has issued a list of machine tools. The Hedden Iron & Construction Co., Elizabeth, N. J., is in the market for a 3-ton hoist. The Robert Dollar Steamship Co., 17 Battery place, New York City, has purchased a 700-foot waterfront at Hunters Point, Long Island, where it contemplates the erection of a $1,000,000 pier. The American Tube & Stamping Co., Bridgeport, Conn., has awarded a 5-ton crane to the Niles-Bement-Pond Co. It is stated that 22 companies applied for specifications.

Heavy Equipment Builders Cannot Get Castings

BUILDERS of heavy machinery and equipment who supply the Pittsburgh market appear to be having considerable trouble in securing sufficient supplies of steel castings and consequently few of them are running or producing normally. The trouble is not a lack of sufficient foundry help, but entirely is due to a scarcity of cleaning room labor. Since this condition is fairly general, attempts to "farm" out casting work have not been overly successful.

Plenty of crane business is in sight, but actual orders are slow in coming out. Few builders are so well off in the matter of bookings as to be indifferent about new business and competition for business is so sharp that it is rather to the advantage of the buyers to wait until they have had all bids and revisions before closing. This, in the lack of a more plausible reason, must be given in explanation for the disproportion between inquiries and sales. The National Roll & Foundry Co., Avonmore, Pa., which is building the hot mill equipment for the Eastern Rolling Mill Co., Baltimore, has been awarded the mill equipment for the new plant at Toronto, O., of the Follansbee Bros. Co., Pittsburgh. Seven cranes and much other equipment are wanted for this plant, and the Carnegie Steel Co. has asked for approximate prices on a number of cranes. Some big machinery orders are likely at no distant date for the new plant of the National Tube Co., at Gary, Ind.

Tool Demand at High Point in Chicago

DEMAND for machine tool equipment is held at a high point in the Chicago district, with general buying in small lots the most important factor and a few large buyers taking a large aggregate in successive orders. The ordnance department has taken over the plant built by the Symington-Chicago Corp. and is using it as a center for disposing of tools brouht here from various outside points. The collection of equipment now on hand there represents millions of dollars and much of it is in demand. Governmental red tape is eminently successful in preventing much selling in spite of the needs of users. The aircraft production division has stopped selling and will not offer anything for a month, taking the time to make an inventory of material on hand.

The Nash Motors Corp. continues to place orders for production equipment for its new plant at Milwaukee, the aggregate running into a large sum. The Samson Tractor Co., at Janesville, Wis., is still in the market, as has been the case for the past few weeks. The Allis-Chalmers Mfg. Co., Milwaukee, is inquiring for equip-

September Machinery Exports Gain Slightly Over August

WHILE exports of machinery showed a slight improvement in September over the preceding month, it is apparent that conditions relating to exchange still are curtailing efforts of exporters. The gain over August, according to figures just issued by the department of commerce, is only $22,359. The total for September, $3,871,502, still is $4,735,063 below the high level for 1919, reached in June, at $8,606,565. France regains the leading position, having taken $1,095,418 worth of American machinery in September. England, which has been first for July and August falls back to second place in September, with $771,538. Japan, Canada and Belgium rank third, fourth and fifth, the same positions occupied by them in August. September imports of American machinery by those countries are $381,038, $375,740 and $358,256, respectively. European Russia which took $57,000 worth in August took none in September; British India also shows a reduction from $160,437 to $59,696. China increases her imports of machinery from $18,469 to $73,678. Detailed figures follow:

	Lathes		Other Machine Tools		Sharpening and Grinding Machinery		All other Metalworking Machinery		Total	
	September	August	September	August	September	August	September	August	September	August
France	$167,401	$118,536	$222,282	$207,829	$ 83,405	$ 65,985	$ 622,330	$ 383,208	$1,095,418	$ 785,558

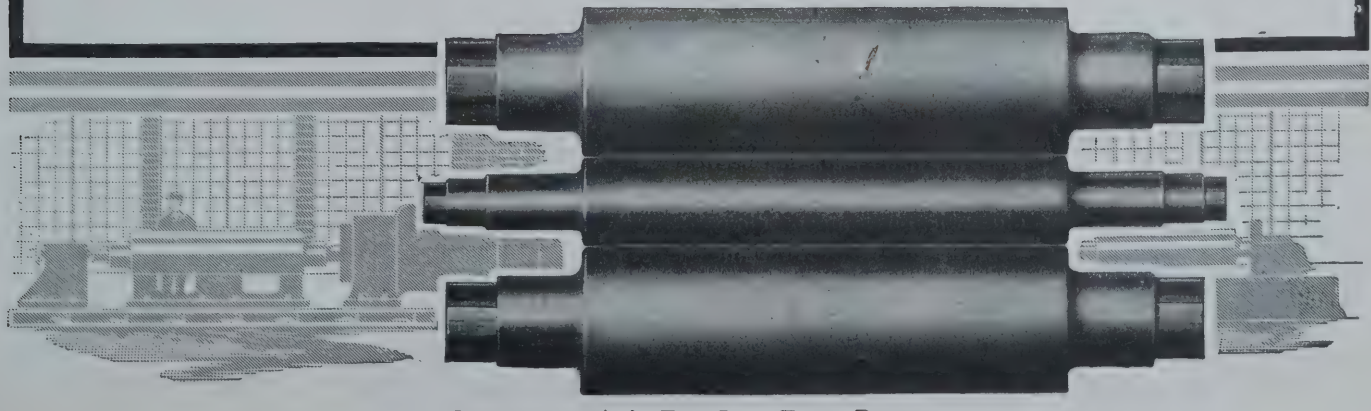
Rolling Mill Jim Offers Thanks

Say fellas—

There's lots to be thankful fir—look at the abundance of good things all around us, and then if you hurry in your orders you can get Hubbard Rolls, and if you know about 'em as I do, they're a lot to be thankful fir.



So Long,

Rolling Mill Jim.—

Hubbard Steel Foundry Co.

EAST CHICAGO, IND.

All Kinds of Iron and Steel Rolls and Steel Castings

Say you saw it in THE IRON TRADE REVIEW

ment for a tractor plant and for general purposes. The Chalmers & Williams Co., Chicago Heights, is seeking some unusually heavy equipment, including 72-inch lathes. The inquiry revived recently by the Burlington railroad is still pending but has not resulted in any orders. The Charles Stecher Co., Chicago, manufacturer of automatic machinery, will add to its factory and equipment.

Deferred Deliveries Curtail Machinery Sales

WITH much deferred deliveries only being offered by machinery manufacturers, Cleveland dealers are somewhat handicapped in their sales efforts. Inquiries continue to be received in large numbers and while some quotations are followed by the placing of orders, action on others is being deferred until after the first of the year. The Firestone Tire & Rubber Co., Akron, O., has closed on some equipment but it is stated that the Firestone Steel Products Co., that city, will not place orders on its sizable list until early in 1920. The White Motor Co., Cleveland, which was a large purchaser several weeks ago, now is receiving daily shipments on orders placed at that time. So far as is known, its requirements have been met for the present; it is producing on an average of 50 trucks daily.

The majority of the inquiries now circulating in Cleveland are for one tool; several for two, three and four are claiming attention and a request for prices on a larger number is the exception. The Lewis Steel Products Co., Toledo, O., wants new or used equipment as follows: One each Stewart triple purpose furnace, No. 1 LeBlond tool room grinder; No. 1 B universal Milwaukee milling machine; 16-inch drill press; and 16-inch Gould & Eberhardt or Cincinnati shaper. The Raub Supply Co., successor to the Sheet Metal & Supply Co., Lancaster, Pa., wants a metal sawing machine suitable for sawing cold rolled rings up to 4¼-inch diameter and also angles. The Lakeside Forge Co., Erie, Pa., wants a Keller automatic profiling machine. The Chevrolet Motor Co., Flint, Mich., wants a large bulldozer. The Woodhill Stamping Co., 10585 Quincy avenue, Cleveland, wants a drawing press for medium work, with 4 to 6-inch stroke. The Superior Foundry Co., Cleveland, wants a 5-ton crane and the National Supply Co., Toledo, O., is in the market for a small wall-type jib traveling crane. The New York Central railroad, Cleveland, issues tentative inquiries for needed tools, but no real buying on the part of the railroads is anticipated until they are returned to private ownership. The Atlas Car & Mfg. Co., Cleveland, wants a combination punch and shear with 8-foot gap to punch to center of any length 48-inch plate, ⅝-inch thick.

Machinery dealers in Detroit report a fair amount of machinery moving from floors. The Four Drive Tractor Co., Big Rapids, Mich., is in the market for $10,000 worth of machinery. The Benton Harbor Malleable Foundry Co., Benton Harbor, Mich., wants one 2-stage air compressor with a capacity of 450 cubic feet or more.

Apparently users located at a distance from the immediate vicinity of Cleveland, are having difficulty meeting their requirements. Wm. Sears & Allen, Chicago, is in the market for National automatics. Willicott Machine Corp., Baltimore, wants one old style pit lathe or chucking lathe, head suitable to swing 12 or 15 feet in diameter; one old style boring mill or similar apparatus which would swing 10 or 15 feet in diameter; one second-hand planer 48 inches x 15 feet; one second-hand lathe to swing 36 or 48 inches. Williams & Wilson, Ltd., Montreal, Que., want one 72-inch x 20-foot planer for light work or one 72-inch x 20-foot planer, enlarged to 100-inch. This latter's customer will take a 96-inch x 96-inch x 20-foot planer or one widened to 120-inch. The J. B. Klein Iron & Foundry Co., Oklahoma City, Okla., wants two electric traveling cranes; one 5 to 7½-ton, 45 to 50-foot span, and one 3½ to 5-ton, 35 to 40-foot span. Both cranes to be 3-motor type, 220 volt, 3-phase, 60-cycle; floor operator preferred.

A few inquiries are being received and quoted upon by the Cleveland Duplex Machinery Co., Cleveland, on the equipment it is offering from the plant of the American Multigraph Co., that city. One of these comes from New York City. The Hendrickson Machine Co., 1310 East Fourteenth street, Cleveland, which is going out of business, is endeavoring to dispose of one 18, one 20 and one 22-inch engine lathes. The Guide Motor Lamp Co., 11500 Madison avenue, Cleveland, is disposing of some of its equipment and it is understood that after it is sold will place orders for its requirements. It has purchased land for a new factory, 120 x 500 feet, to cost $225,000.

Lists of equipment, varying in size according to the size of the project, are expected soon from the following: The Cole Motor Car Co., Indianapolis, which is to erect a new building; Mutual Truck Co., Sullivan, Ind., which is erecting an addition, 100 x 300 feet; the Federal Tool Co., 453 Michigan avenue, Detroit, which is to build a new plant on Apple street, that city, before the end of the year; the Reynolds Motor Truck Co., Mt. Clemens, Mich., which will build a plant; the National Automatic Tool Co., Richmond, Ind., which has placed contracts for a new plant; the Thomas J. Corcoran Lamp Co., Cincinnati, which is to spend $250,000 on a 4-story addition; and the International Boiler Works Co., Stroudsburgh, Pa., which is erecting a modern plant on a 40-acre site recently acquired.

Six machine shops will require considerable equipment, some of which will be bought in Cleveland. These are being erected for the following companies: The Towers-Sullivan Mfg. Co., Rome, Ga.; Wood Hydraulic Hoist & Body Co., Detroit; American Brake Co., 1900 North Broadway, St. Louis; W. H. Smith, care Ernest McGeorge. 1900 Euclid avenue, Cleveland; Charles A. Fair, 128 Sylvan Terrace, York, Pa., and the Danville Iron & Steel Co., Danville, Pa.

Another automobile company has been incorporated in Indiana. This is the H. C. S. Motor Car Co., Indianapolis, with a capital of $1,000,000. H. C. Stutz is interested.

Canadian Tool Users Demand Many Tools

CANADA'S machine tool and equipment market is very active. Demand for new equipment is brisk but in many cases dealers are unable to promise delivery for three or four months. Rebuilt tools and machinery also are in good demand, chiefly due to low prices and quick shipment. Shops are busy rebuilding war machinery which is taken up almost as rapidly as it leaves the shop.

The McKinnon Industries, Ltd., St. Catharines, Ont., is in the market for shears with a capacity for sheets 48 inches wide x ¼-inch thick. The Corbet Foundry & Machine Co., Owen Sound, Ont., is inquiring for a modern set of 5-ton chain blocks. The Dillon Crucible Alloys, Ltd., Welland, Ont., is in the market for alligator shears for cutting steel bars. The Ontario Furniture Co., 365 Bleury street, Montreal, Que., is in the market for air compressor with motor or gas engine. A. S. Forman, 24 Chesterfield avenue, Montreal, Que., has asked for a steam engine and generator, 15 kilowatt; also stationary gas engine about 4 horsepower. The Thomas Organ & Piano

Co., Woodstock, Ont., wants a 24 or 30-inch cabinet planer. The Colonial Wire Mfg. Co., Hamilton street, Montreal, Que., will purchase machinery for a new factory. The Dominion Rubber System Co., 201 Inspector street, St. Gerome, Que., is asking for prices on machinery and equipment for a new plant. The city of Edmonton, Alta., Mr. Clark, mayor, is receiving prices on power plant machinery and equipment.

Construction and Equipment

Concise and Timely Business Building Opportunities from the Field of Industry

Among New England Plants

BOSTON.—Plans are being drawn for a 1-story, 150 x 110-foot factory for the Eco Mfg. Co., maker of piston rings.

BOSTON.—The National Wrapping Machine Corp. has been incorporated with $325,000 capital, by Kendall A. Sanderson, Frank C. Williams and Walter A. Dane.

BOSTON.—The Conway-Cannon Co. has been incorporated to make iron, steel, brass and other metals with $5000 capital, by C. W. Conway, H. F. Cannon and Thomas Kelly.

BOSTON.—The Boston Merchant Marine Sealing Co., vessel repairing, has been incorporated with $25,000 capital, by John J. Collins, William F. Collins, Thomas H. Ryan, Russell V. McIntosh, Winfield, Me., and others.

CAMBRIDGE, MASS.—The Palmer Electric Mfg. Co. has started work on a plant, 50 x 200 feet.

CAMBRIDGE, MASS.—The Middlesex Mfg. Co., factory equipment, recently was incorporated with $25,000 capital by Edward F. O'Brien, Harry L Michaels and Walter Hartstone.

CHELSEA, MASS.—The Smith Steel Products Co. has been incorporated with $25,000 capital, by Arthur L. Smith, Hiram A. Lerner and Moses Rosenthal.

DORCHESTER, MASS.—The Harrison Square Foundry Co. is erecting an addition to its foundry, 2-stories, 50 x 100 feet.

EAST CAMBRIDGE, MASS.—The contract has been awarded for a 1-story, 50 x 200-foot plant for the Palmer Electric Mfg. Co., South Boston, Mass.

HARTFORD, CONN.—The Hanson-Whitney Machine Co. has started on a new plant, to be 4-stories, 60 x 120 feet.

LYNN, MASS.—The Lynn Machine & Screw Co. has been organized to manufacture screw machine products. New equipment and machinery has been ordered.

LYNN, MASS.—The Rex Engineering Co. has been incorporated with $50,000 capital, by Arthur L. Cash, H. Ashley Bowen, Swampscott, Mass., and Sven R. Bergman.

MALDEN, MASS.—The Malden & Melrose Gas Light Co. will build a storage building, 36 x 52 feet.

MERIDEN, CONN.—The Wolf Emery Wheel Co. has changed its name to the Wolf New Process Emery Wheel Co. and has increased its capital stock. The company will erect a new plant, 1-story, 47 x 52 feet.

SPRINGFIELD, MASS.—The Stevens-Duryea Co. has started work on a plant addition.

TAUNTON, MASS.—The General Electric Co. contemplates the erection of a small addition.

WEST SPRINGFIELD, MASS.—The Smith Body Co. has let the contract for a factory, steam plant and dry kiln to cost $42,000.

WORCESTER, MASS.—The American Steel & Wire Co. will erect a 1-story, 20 x 100-foot machine shop at its South Works.

WORCESTER, MASS.—The Olson Mfg. Co., screw machine products, has purchased a site on which it is reported planning to erect a plant.

WORCESTER, MASS.—Plans are being made for a 1-story, 90 x 113-foot factory for the Park Mfg. Co., maker of screw machine products.

WORCESTER, MASS.—The Clarke-Emerson Mfg. Co. recently was incorporated with $50,000 capital to manufacture shoe last measuring machines.

WORCESTER, MASS.—The Hobbs Lock Washer Co., which is being organized by Samuel T. Hobbs, 216 Park avenue, and others, is reported ordering equipment.

PAWTUCKET, R. I.—The William H. Haskell Mfg. Co. will build a 2-story, 85 x 150-foot machine shop addition to cost $75,000.

PROVIDENCE, R. I.—The Spartan Needle Co. recently was incorporated with $200,000 capital to manufacture steel needles.

PROVIDENCE, R. I.—The Texas Co. contemplates a machine shop addition, 40 x 160 feet.

ALLINGTON, CONN.—The New Haven Machine Co. contemplates a manufacturing building to be 60 x 200 feet.

BRIDGEPORT, CONN.—The Coulter & McKenzie Machine Co. will build a factory addition.

BRIDGEPORT, CONN.—The Bridgeport Hardware Co. has let the contract for a 2-story, 40 x 125-foot plant to cost $35,000.

BRIDGEPORT, CONN.—The United Illuminating Co. will erect a power house of 75,000 horsepower capacity, generator house, boiler house, switchboard and screen house. The plant will be equipped with automatic stokers and ash removers.

BRISTOL, CONN.—Work will be started on additions to the plants of the New Departure Mfg. Co. at Bristol, Meriden, and Elmwood. In Bristol, three large buildings will be erected, one a forge shop, 126 x 405 feet, 1-story, another a die, machine and tool building, 70 x 270 feet, and the third a storage building, 75 x 240 feet. A new ball plant will be erected. An annealing plant, 110 x 200 feet, also is being planned. At the Elmwood plant, there will be a three and 4-story building, 60 x 220 feet. At Meriden, two new buildings will be erected.

HARTFORD, CONN.—The Hartford Electric Light Co. will erect a $38,000 warehouse.

HARTFORD, CONN.—The Royal Typewriter Co. will start work in the spring on a 5-story, 50 x 310-foot plant addition.

HARTFORD, CONN.—The Southern New England Telephone Co. has let the contract for a 6-story, 33 x 90-foot building addition.

HARTFORD, CONN.—Bids closed Nov. 19 for a 1-story, 60 x 200-foot factory to cost $30,000 for the Hartford Special Machinery Co.

HARTFORD, CONN.—The Auto Supply Mfg. Co. has been incorporated with $100,000 capital, by E. E. Tryon, M. Rudick, H. G. Bowman Jr. and John Weber.

HARTFORD, CONN.—The Claflin Oil Derrick Supply Co. has been incorporated to make derricks with $200,000 capital, by Daniel M. Wright, Charles R. B. Claflin and Horace W. Griffith, Buffalo. An assembling plant will be located in Buffalo.

MERIDEN, CONN.—The Wolf New Process Emery Wheel Co. has been incorporated with $500,000 capital and will erect a 1-story, 47 x 52-foot plant.

NEW HAVEN, CONN.—The Acme Wire Co. has let a contract for a storage building, 35 x 50 feet.

NEW HAVEN, CONN.—The Oven Equipment & Mfg. Co. will build a 1-story, 90 x 280-foot plant.

NEW HAVEN, CONN.—The William Schollhorn Co., pliers and tools, will build a 4-story, 40 x 140-foot plant.

Touring Trade Centers

AFTER eight months spent in studying the industrial machinery situation in France and Belgium, Trade Commissioner Charles P. Wood, of the bureau of foreign and domestic commerce, has returned to this country and is visiting the various manufacturing and exporting centers to discuss with business men the facts his investigation has brought to light.

Major Wood is an experienced engineer, and saw service in the British, French, and American armies during the war, receiving the croix de guerre from the French for conducting successful gas attacks against the enemy. His itinerary for the tour which he now is taking, is as follows:

Baltimore, Nov. 12-13; Philadelphia, Nov. 14-15; New York, Nov. 17-22; Boston, Nov. 24-26; Pittsburgh, Nov. 28-29; Cincinnati, Dec. 1-2; Cleveland, Dec. 4; Detroit, Dec. 6; Chicago, Dec. 8-11; St. Louis, Dec. 12-13; Chattanooga, Tenn., Dec. 15; Birmingham, Ala., Dec. 16; Atlanta, Ga., Dec. 17.

NEW HAVEN, CONN.—The O. B. North Co., maker of hardware, has let the contract for a 25 x 56-foot factory addition to be used for annealing purposes.

NEW HAVEN, CONN.—The Seamless Rubber Co. has let the contract for a 2-story, 113 x 42-foot power house to include a 180-foot stack and a 60-foot water tank, to cost $100,000.

STRATFORD, CONN.—The Albert Peck Co., manufacturer of silverware, has had plans prepared for a 2-story, 67 x 180-foot plant.

TORRINGTON, CONN.—Contracts for a $80,000 addition, 2-stories, 50 x 340 feet, to the Standard plant of the Torrington Co. has been awarded to the Torrington Building Co.

WATERBURY, CONN.—The Waterbury Jewell Co. plans a plant for the manufacture of metal novelties.

North Atlantic States

BUFFALO.—The A. F. Oliver Gear & Machine Co., 60 Cherry street, has let a contract for a 3-story addition.

BUFFALO.—The Huron Electric Co. recently was incorporated with $10,000 capital, by S. Eckert, E. A. Heller and E. J. Hanks.

BUFFALO.—The Bagg Steel Wheel Corp. has been incorporated with $200,000 capital, by C. M. Bagg, F. C. Schoenthal and T. F. Hogan.

BUFFALO.—The Arrow Tool Co. has been incorporated with $100,000 capital, by R. J. Mackenzie, K. B. Macdonald and J. E. McArthur.

BUFFALO.—The Automatic Tire Machine Corp. has been incorporated with $1,500,000 capital, by S. H. Millener, W. A. Schaffer and H. G. E. Smith.

GLOVERSVILLE, N. Y.—The Fulton County Machine & Supply Co. recently was incorporated with $150,000 capital, by E. H. Van Valkenburgh, W. S. Decker and H. A. Steele.

LONG ISLAND CITY, N. Y.—The Houpert Machine Co. has had plans prepared for plant extensions, to cost $25,000.

NEW YORK.—The Albin Tool Corp. recently was incorporated with $150,000 capital, by J. W. Albin, F. R. Walker and C. D. Rose, 336 Sixth avenue.

NEW YORK.—The Triangle Iron Works, Inc., recently was incorporated with $10,000 capital, by A. and G. Lechtman and G. Lippert, 4525 Park avenue.

NEW YORK.—The Paragon Bale-Tie Machine Corp. has been incorporated with $200,000 capital, by E. J. E. Vollber, O. C. W. Brede, 111 West Forty-second street, and others.

NEW YORK.—The Wilsch Machine Specialty Co. recently was incorporated with $50,000 capital to make machinery and dies, by M. Stone, N. Nyer and W. Schenker, Broadway Central hotel.

NEW YORK.—The Vitreous Enameling & Stamping Co., 11 East 147th street, which was recently organized with $300,000 capital, is having plans prepared for a plant, 1-story, 95 x 172 feet.

RICHMOND, N. Y.—The West Brighton Brass Foundry, Inc., has been incorporated with $10,000 capital, by P. J. Knobloch, M. H. and M. Epstein, 721 Fulton street, Brooklyn, N. Y.

ROCHESTER, N. Y.—The Yawman & Erbe Mfg. Co., 424 St. Paul street, is having plans prepared for an addition.

SYRACUSE, N. Y.—Plans are being prepared by the H. H. Franklin Mfg. Co. for a plant here for the manufacture of motor trucks.

SYRACUSE, N. Y.—The Syracuse Alloy Steel Co. recently was incorporated with $190,000 capital, by F. W. Hertrick, C. A. Lawton and M. O. Warwick.

DANVILLE, PA.—The Danville Iron & Steel Co. has been purchased by George E. Clarke and others of New York, and improvements will be made to the plant by the new owners. A new machine shop, 100 x 220 feet, will be among the improvements.

ERIE, PA.—The Erie Tool Works, 640 West Twelfth street, has purchased the plant of the Brown Folding Machine Co., and will move into it shortly. In addition to the plant, the company has purchased a site, 30 x 135 feet, adjoining, which will probably be used for extensions.

GREENVILLE, PA.—The Greenville Steel Car Co. has arranged to spend $100,000 for a machine and pattern shop addition to the plan shop, an extension to the car shop and an office building.

MACUNGIE, PA.—The East Penn Foundry Co. is contemplating a plant addition.

MARCUS HOOK, PA.—The Marcus Hook Foundry Co. recently was incorporated with $50,000 capital by M. W. Lefever and others.

PHILADELPHIA.—Ballinger & Perrot are receiving bids on an addition to the Esterbrook Steel Pen Co., Camden, N. J.

PHILADELPHIA.—William Steele & Sons are taking bids on the construction of a 3-story warehouse, 60 x 90 feet, for the American Insulation Co.

PHILADELPHIA.—A general contract for a warehouse and power plant for H. O. Wilbur & Sons, Inc., has been awarded to the Turner Construction Co.

PHILADELPHIA.—The plant of the Tabor Mfg. Co., Eighteenth and Hamilton streets, manufacturer of molding machines, etc., recently was damaged by fire.

PHILADELPHIA.—Contracts for the erection of a $30,000 rolling mill for the Pennsylvania Forge Co. have been awarded to the William G. Donley Co. The building will be 1-story, 102 x 200 feet.

PITTSBURGH.—The Federal Spring Co. has been incorporated with $5000 capital, by R. T. Rossell, E. C. McHugh, L. R. Martin, C. J. Nicklas and F. J. Young.

PITTSBURGH.—The Armstrong-Williams Co., recently organized to manufacture machine parts, has acquired a 4-story building which it will equip for machine and auto repair operations.

SCRANTON, PA.—Excavation work for the foundation of a 3-story addition to the plant of the Victor Typewriter Co. has been started.

STROUDSBURG, PA.—The International Boiler Works Co. has acquired 40 acres on which it is reported planning a modern plant.

STROUDSBURG, PA.—Work will be started shortly by the International Boiler Works Co. on a large plant. Equipment is being purchased.

YORK, PA.—The Brooks Machine Co. recently purchased the York Steam Boiler Works.

CAMDEN, N. J.—The Esterbrook Steel Pen Co. has had plans drawn for additions and alterations to its plant.

HOBOKEN, N. J.—The Wedlake-Lamson Co., Inc., 1616 Willow avenue, recently was incorporated with $75,000 capital, to manufacture iron, steel, etc.

JERSEY CITY, N. J.—The New Jersey Bolt & Forging Co., 241 Seventeenth street, has been incorporated with $25,000 capital.

NEWARK, N. J.—The Newark Leather Machinery Co. will erect a 1-story plant, 50 x 112 feet.

NEWARK, N. J.—The Duratex Co. has awarded contracts for three factory buildings, 102 x 561 feet, 48 x 50 feet and 60 x 80 feet.

NEWARK, N. J.—The Essex Metal Co., Inc., 22 Orange street, has been incorporated with $100,000 capital to manufacture iron, steel, etc.

SPRINGFIELD, N. J.—The Springfield Reamer & Tool Co. recently was incorporated with $25,000 capi-

Business Changes Recently Announced

ADMINISTRATIVE offices of the J. T. Tractor Co., Cleveland, have been removed to the company's new plant at 1516 Fairfield road, just off West Fourteenth street. The new plant is the first unit of several which are to be erected on the 6-acre site on which the company holds a 25-year lease.

* * *

3½ to 4½-inch	—16

Driving Without Slip

THIS is the way to transmit power and it is being done every day in modern mills, factories and plants throughout the country by Link-Belt Silent Chain Drives.

Link-Belt Silent Chain Drives transmit all the power of the motor to the machine for useful work without the slippage and constant loss of power so common with leather belts, and without the noise of gearing.

Link-Belt Silent Chain is the ideal method of transmitting power. If you want 98.2% efficiency in power transmission, learn all about the Link-Belt Silent Chain Drive. Write for data Book No. 125.

If every mill, factory and shop in the United States had this 98% efficient drive instead of power wasting, slipping leather belt drives, production would increase.

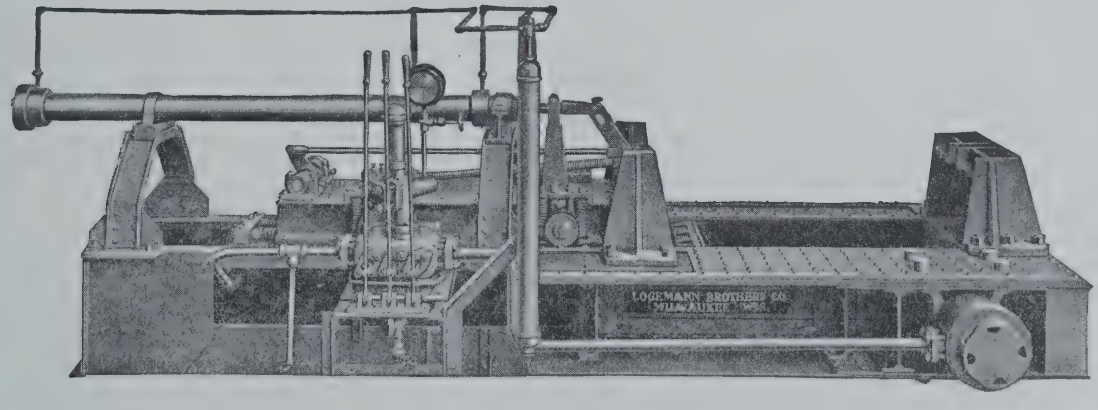
When the Scrap Market Is Dull

While seeking a more favorable market the best form in which to hold your sheet scrap, etc., and the form that always commands the best prices is the dense hydraulically compressed bundle.

Thus less storage space is required—under roof to prevent loss from corrosion; and because of greater car tonnage under minimum car rate, you add from 25% to 50% freight savings to your profits.



For greatest compression, largest daily output, at lowest operating cost, use

LOGEMANN Double Ram Hydraulic Scrap Metal PRESSES

You can enjoy the advantage of the accumulated experience from hundreds of Logemann scrap bundling presses now in use.

They embody a simplified mechanism that requires no special skill to operate rapidly. Press and pump are so designed that all the motive power applied is utilized, thus reducing power cost.

Powerfully built, all working parts constructed to resist the severest strains—selected material, first class workmanship—all minimize upkeep cost and insure lasting efficiency.

A medium sized press is shown; there are smaller and larger sizes in standard models.

Advise character and daily tonnage of your scrap and let us suggest press best suited to your requirements.

New Trade Publications

THERMIT WELDING.—A folder entitled, "How Thermit Cured My Diseased Neck," containing a story "told by a roughing mill pinion, as to the process by which its damaged neck was repaired," is being circulated by the Metal & Thermit Corp., New York.

CLUTCHES.—An illustrated booklet has been published by the Medart Patent Pulley Co., Inc., St. Louis, in which friction clutches for transmission equipment are described and illustrated. Various data pertaining to this type of transmission are given.

ELECTRIC DRILLS.—The Independent Pneumatic Tool Co., Chicago, is circulating an illustrated leaflet in which electric drills and grinders are described and illustrated. According to the leaflet, these tools can be operated from any electric lamp socket.

HEAT TREATING.—A booklet containing a preliminary chapter from the "The Heat Treating Handbook," soon to be issued complete by Tate-Jones & Co., Inc., Pittsburgh, is being distributed. The chapter is devoted to normalizing and heating. The fore part of the booklet contains descriptions and illustrations of heat treating furnaces.

MICROSCOPES.—The Bausch & Lomb Optical Co., Rochester, N. Y., recently published the twenty-eighth edition of its microscope catalog, which contains data, specifications and illustrations of microscopes for various work, including metallurgical research. Two types of microscopes for metallurgical work are described.

COMPRESSED AIR EQUIPMENT.—Under the title, "Compressed Air in the Saw Mill," a booklet issued by the Ingersoll Rand Co., New York, describes the use of compressed air equipment in the operation of various departments in a sawmill. This equipment includes hoisting apparatus, pneumatic tools, compressors, condensers, pumps, etc. The booklet contains a number of illustrations.

PNEUMATIC DRILLS.—The Ingersoll-Rand Co., New York, is circulating a 40-page booklet in which pneumatic drills, grinders and saws are described and illustrated. Several types of each tool is described and all are accompanied with complete data and specifications. A number of the illustrations show the kind of work to which these tools are adapted.

MISCROSCOPES.—A 4-page folder has been published by Holz & Co., Inc., New York, describing 1920 microscope outfits. According to the leaflet a complete outfit permits photographs under magnification from 1 to 3500. Both forms of vertical illuminators are contained and the focusing movement is separated from the base, which according to the leaflet, represents an advance in the design of metallographic microscopes. Other details of the equipment are explained.

CONCRETE FORMS.—Steel forms for use in concrete construction work are described and illustrated in a booklet being circulated by the Blaw-Knox Co., Pittsburgh. The booklet shows how these forms are used on a great variety of work and describes the method of assembling and applying them to various types of construction. The forms are entirely of steel and each weighs about 22 pounds. They are connected and held in alignment by means of liners, keys and ties.

COAL CUTTER.—An illustrated booklet of 16 pages recently was published by the Ingersoll-Rand Co., New York, in which a coal mining machine is described. The illustrations show the machine in actual operation, such as overcutting and undercutting a vein of coal. Usually but two men are employed in the operation of the machine and it can be easily and quickly set up and taken down. Various parts of the machine are described, and the booklet contains data pertaining to the performance of the machine in several mines where it has been used extensively.

(*Concluded from* (1419)

has secured a 3-story building and will install machinery for the manufacture of valves.

HAMILTON, ONT.—The Canadian Westinghouse Co. has let the general contract for an addition to cost $30,000.

HAMILTON, ONT.—The Hoover Suction Sweeper Co. of Canada, Ltd., recently was incorporated with $1,000,000 capital, by William H. Hoover, Frank G. Hoover and others.

KITCHENER, ONT.—The F. W. D. Auto Co. has let the general contract for a factory to cost $10,000.

MERRICKVILLE, ONT.—The Percival Plow & Stove Co. is reported contemplating a plant addition.

STRATFORD, ONT.—The Canadian General Electric Co. has bought a plant here and is installing equipment.

TORONTO, ONT.—The Nash Motor Co., Oshkosh, Wis., is making arrangements for a manufacturing plant here.

TORONTO, ONT.—The F. F. Barber Machinery Co., Ltd., has been incorporated with $200,000 capital, by Frank F. Barber, Leopold Macaulay, William T. Sinclair and others.

VANCOUVER, B. C.—The Standard Motors, Ltd., Kinsway, has awarded a general contract for a garage to cost $22,000.

VANCOUVER, B. C.—The Sumner Metal Works, Everett, Wash., will establish a branch plant here. The present plant of the Allan & McKelvie Co., will be taken over by the new company, and an addition erected. The Canadian company will be capitalized at $250,000, and the officers will be George Sumner, president; Mr. Allan, vice president and A. McKelvie, secretary-treasurer.

Opportunities Abroad

Requests for information should be forwarded to district or co-operative office in your district, of the Bureau of Foreign and Domestic Commerce. Each request should be on a separate sheet and be accompanied by the opportunity number

A firm in Spain desires to secure agencies for the sale of machinery and all raw materials for industries. Correspondence should be in Spanish. Opportunity No. 31259.

An agency is desired by a party in Italy for the sale of hydraulic turbines, machine tools, electrical machinery and supplies. Opportunity No. 31203.

A company in Greece desires agencies from manufacturers for the sale of iron concrete reinforcement bars, structural and shipbuilding iron and steel, plain and galvanized soft-steel sheets, corrugated-iron sheets, steel, iron and copper pipes, internal combustion engines, marine engines, pumps, electric motors, electric machinery, electric cables and wires and steel ropes and wires. Opportunity No. 31207.

A business man in England desires to secure an agency or act as a representative of electrical and mechanical engineering concerns, motor car manufacturers, machine tools, automobile accessories, etc. Opportunity No. 31223.

A commercial agent in France desires to secure an agency for the sale of machinery, tools, and general merchandise. Opportunity No. 31224.

An agency is desired by a commercial agent in Switzerland for the sale of various articles including machinery, iron articles, electric instruments, etc. Correspondence should be in French. Opportunity No. 31227.

A commercial agent in Spain desires to secure agencies for the sale of iron and steel sheets, metals, hardware, electrical supplies, chemicals, etc. Correspondence should be in Spanish or in French. Opportunity No. 31228.

An American who has been a traveling salesman in Europe for several years, is in the United States and desires to secure an agency for the sale in Central Europe of stoves, radiators, gas water heaters, bathroom and plumbing supplies, agricultural implements, etc. Opportunity No. 31232.

An agency is desired by a party from Australia for hardware, aluminum goods, etc. Opportunity No. 31234.

A resident missionary in the Dominican Republic desires to receive tenders for the iron framework and sheet-iron sides and roof of a new church. The building is to be 1 story in height. Opportunity No. 31236.

An agency is desired by a party from Brazil for the sale of agricultural implements, dairy machinery, tractors, cotton gins, presses, seed-crushing machinery, etc. Opportunity No. 31244.

Tenders have been received from a firm in South Africa for the supply of brass piping and brass and copper sheets for railways and harbors. Proposals must be received before Nov 29. Opportunity No. 31245.

The director of an agency firm in Spain desires to secure agencies for the sale of agricultural implements, such as plows, threshers, reapers, as well as hand tools, hammers, saws, etc. Correspondence should be in Spanish or French. Opportunnity No. 31246.

A commercial agent in Spain desires to secure an agency for the sale of bandsaws, sawmill machinery, etc. Correspondence should be in Spanish. Opportunity No. 31255.

A merchant in England desires an agency direct from manufacturers for the sale of cement, twisted steel bars for concrete reinforcement, etc. Opportunity No. 31256.

THE IRON TRADE REVIEW

Vol. LXV Cleveland, November 27, 1919 *No. 22*

Scarcity of Material More Acute

Production of Iron and Steel Still Lags and Market Shows Varied Price Tendencies —Many Lines Advancing—Coal Strike More of Factor—Pennsylvania Reserves Rail Tonnage

VARIOUS cross currents continue to influence production and prices in iron and steel. The direct effects of the steel strike at present have been minimized but operating efficiency in many plants has not been restored to the basis prevailing before the various suspensions. In some cases this is due to the reorganization of works forces which has been found necessary. Blast furnace labor is lacking in some districts and this is preventing the resumption of certain stacks. With demand of large proportions and apparently growing, these drags upon production added to the tonnage already lost, serve to intensify the strength of prices and to point the market to constantly higher levels.

Actual and possible effects of the continuing coal strike are more of a factor. In sheets it is feared that production which has been rising steadily may again be set back unless the reduced supplies of fuel of the mills are replenished quickly. A softer market has developed in some grades of scrap because some plants have been forced to slow down their operations.

Prices Are Divergent

The Steel corporation mills continue their policy of holding back on price advances and at this time there is strong likelihood of no changes in their schedules before the end of the first quarter at least. However their sales continue to be confined to regular customers and as their deliveries in many lines now are a matter of months, the influence of their position on the general market is becoming less. As a result, the selling policies of various producers are more divergent and prices show a growing spread. Some makers because of the upset condition of individual mill costs, are allowing the latter more definitely to govern the variations of their selling figures and are letting practically each transaction make its own price. A large eastern producer has been taking first quarter orders in steel bars at 2.50c, Pittsburgh, and second quarter at 3.00c, Pittsburgh. Other mills are selling at considerable advances over the nominal market of 2.35c, Pittsburgh. Eastern makers have sold plates in considerable tonnage at 2.75c and 2.85c mill.

Famine in Some Lines

Almost a famine prevails in certain lines of finished steel and bids by buyers are on that basis. This is especially true of wire nails, early sheets, small bars and some other products. In tin plate, makers are allotting tonnage for first half on a fractional scale. The larger mills are sold up several months on bars and on the larger sizes of structural shapes, deliveries have fallen back decidedly.

The Pennsylvania railroad has made reservations with various mills for 186,000 tons of rails for delivery over the first half. The division gave the Carnegie Steel Co. 80,000 tons, the Bethlehem Steel Corp. 56,000 tons, the Cambria Steel Co. 30,000 tons and the Lackawanna Steel Co. 12,000 tons. Prices are to be fixed later. At Chicago about 300,000 tons of rail orders for western roads await only the affixing of signatures to contracts.

Iron Advance Continues

Pig iron prices are keeping up their rise but under a lighter volume of sales as makers are holding back on further bookings. Supplies are limited and many consumers have been unable as yet to cover for first quarter or beyond. Spot iron is extremely scarce and makers are obtaining for it almost any price they ask. Furnace operations are showing the usual irregularities that attend a resumption after a period of idleness. Foundry iron is up to $35 at Chicago, to $34 to $35 in the valley and lake districts and to $37 to $38 in the East. One Alabama maker has taken some tonnage for first quarter at $33 Birmingham. The situation in basic is becoming interesting as there are more buyers than sellers; furthermore it has been complicated because two producers have been forced into the central western market as buyers due to furnace troubles. Several thousand tons of bessemer have been sold up to $34 valley furnace.

Paying the Price of Radicalism

THAT production is the basic and controlling factor in prices and that any restrictions or interference placed upon it are bound quickly to register their effects is being fitly demonstrated by the present course of the iron and steel market.

During the past month prices on all leading products have strengthened materially and in some cases, notably pig iron, the advance has been rapid and abrupt. Today pig iron prices are quotable from $6 to $7 a ton over the level that prevailed around mid-October. The general average of the market has been advanced fully by this amount. In steel products the rise has been less general and more erratic, being confined more to individual producers than to the general industry. The reason for this is to be found in the persistent efforts which strong interests in the industry, such as the Steel corporation and certain leading independents have been exerting against an upward swing of the market in view of the nation-wide campaign that has been made to reduce the high cost of living. Up to this time this policy of powerful producers in attempting to hold the market in check has been instrumental in keeping back advances. It is a question, however whether now it is not losing much of its effect and will do so in an accelerated way as the underlying economic forces assert themselves more insistently. In the end supply and demand must prevail.

Before the steel strike of Sept. 22 the market was moving along in a firm but orderly fashion. The present elevated condition of prices, there can be no doubt, is due above all other things to the shortened supply of material occasioned by the loss of production during the strike. Furtherfore all this is water that has gone past the mill and it represents a deficiency of output which cannot be recovered. It promises therefore to be a fixed and continuing factor which will have its effect upon prices for some time to come unless demand should slump decidedly which does not appear likely. The influence of this lost tonnage must be in the direction of higher prices. The strike imposed upon the steel industry by the minority misled by their leaders or fatuously following a mistaken cause, has been lost by the men as it was certain it would be from the beginning in view of its flimsy and insincere basis. Nothing has been gained but much has been lost for the industry and country at large. The scars of the strike remain in the higher prices that have been forced upon buyers and therefore in the end upon the general public, in the loss of wages, expected profits, unearned interest charges, increased depreciation, etc. The bill is far too large for the country to pay that a radical coterie of labor agitators might have a chance to try out a set of unjust and extreme demands.

Shipbuilding Awaits Government Exit

DOMESTIC demand for shipbuilding material undoubtedly will increase with 1920. All present indications point to this fact. Ship repair yards still are extremely active and the volume of contracts for future work is holding up evenly. Much further new construction likewise is promised, despite the determination of the government to end its shipbuilding activities as soon as possible.

The Atlantic Gulf West Indies Steamship lines has let contracts for eight tankers. The Bethlehem Steel Corp. has drawn plans for a number of 17,000 ton Chilean ore carriers. The Standard Oil Co. is preparing to build some of the largest tankers ever constructed. The Florida East Coast Line plans two new passenger vessels for the Cuban trade. Naval architects are extremely busy putting the plans for the new work on the board. While the time between the incipiency of the plans and the actual letting of contracts is normally lengthy, the new work for American shipyards in sight assures a large volume and is a matter which should give considerable gratification.

Shipbuilders now are anxious to rid themselves

of government contracts and to return to the old scheme of competitive conditions. This desire is to be understood as the shipbuilders, like other commercial interests, have come to realize that business fostered and directed by the government is too often subjected to political control which restricts and blocks healthy development and that such interference in the long run will ruin almost any business. Steel producers now have a fine opportunity to lend their support to a sister industry. By encouraging the return to normal and competitive conditions in shipbuilding where private American initiative and genius again may have free play, American steel interests will be assisting in building up an industry in this country which should be able to hold its own with that of any foreign country. The war has upset many fallacies and one of these is that this country could not build ships in quantity and build them well. With the greatest ship steel manufacturing capacity in the world and an artisanship in heavy steel structures that is unrivalled, successful shipbuilding on a commercial basis, it would seem, awaits helpful and systematic teamplay between shipbuilders, steel workers and the government.

Where Appreciation Has Failed

TO NO individuals do the arguments of the radical leaders make a more enticing appeal than to those who are underpaid. It readily can be understood how the man whose income is insufficient to enable him and his family to live decently might be swayed by arguments of those who are in favor of the confiscation and nationalization of property along communistic lines. Such an individual might be excused for welcoming the thought that under such an arrangement his enjoyment of the good things of life might be increased.

Such reasoning undoubtedly impelled President Barr, of the National Founders' association, at the convention of that organization in New York last week to voice a plea for proper and adequate remuneration for the educator class, including the teachers and clergy, in this country. Mr. Barr pointed out how it is customary almost without exception to hire teachers and clergymen at the lowest salaries possible. He urged the upward revision of these salaries, as well as the formulation of some plan by which the members of these professions may be cared for in their old age. Perhaps the prevailing low pay to teachers and clergymen is due to a lack of appreciation of the commanding place, in the existing scheme of things, that these professions occupy. The educators of the country, outside of the parents of each individual child, have more to do with the training of minds and the building of characters than any other agency. The children of today compose the next generation, and the latter will be governed largely by what it learns from the educators of the present day. If higher salaries cannot be had for the educators on the ground of simple justice, surely the necessity of shaping posterity along proper lines should be a determining factor as a commonsense proposition in banishing the penurious and unwise attitude now shown toward those who must be counted upon to keep and direct national thought along safe and sound channels.

Exposing the Wolf Among Labor

SLOWLY but surely the public is awakening to the danger of permitting ignorant and irresponsible troublemongers to sow the seeds of anarchy and revolution while camouflaged as "labor organizers." Men who know absolutely nothing about the industries concerning which they talk, who have at heart neither the interests of the public nor the workers, and whose influence is antagonistic to the welfare of the country, have been given all the liberty they could desire. They have been permitted to libel and slander employers, to mislead employes, and to use any language or means their disordered brains might suggest for stirring up class hatred. But now the public is beginning to realize the extent of the damage which may be done by giving vicious ignoramuses the privilege to malign industrial organizations under the right of "free speech."

A case in point is the arrest last week of John E. McCadden, secretary and treasurer of the Youngstown district for the steel strikers' committee, and organizer in the Youngstown district for the American Federation of Labor. In its issue of Oct. 2, THE IRON TRADE REVIEW quoted at length a speech made by McCadden to steel workers in Youngstown. McCadden lauded the syndicalist, Foster, voiced hatred for employers in the steel industry and urged the men to seize the mills if the employers did not surrender to the dictates of the strikers' committee. More than two months elapsed and the strike was practically over in the Youngstown district before the authorities of that city concluded it was against public policy to permit McCadden to continue pouring forth his venom. McCadden was arrested on the charge of preaching syndicalism and is now out on a bond of $3000, awaiting trial. It may be considered but a small incident in the labor situation today, but it is significant when the authorities in a large industrial community recognize the fact that the public wants no more of this Jekyl-Hyde arrangement whereby privileged organizers of the American federation may expound Russian doctrines and do so with perfect impunity.

Iron and Steel Prices

Corrected to Wednesday Noon

SCRAP, WAREHOUSE, ORE AND OTHER PRICES ON PAGES 1484 AND 1486

Pig Iron

Bessemer, valley	$33.00
Besesmer, Pittsburgh	34.40
Basic, valley	31.00 to 32.00
Basic, Pittsburgh	32.40 to 33.40
Basic, delivered, eastern Pa.	31.00 to 32.00
Malleable, Pittsburgh	35.90 to 36.65
Malleable, Chicago, furnace	35.50
Malleable, Buffalo, furnace	36.25
Malleable, delivered eastern Pa.	36.00 to 37.00

FOUNDRY IRON SILICONS

No. 2 Northern	1.75 to 2.25
No. 2 Southern foundry	1.75 to 2.25
No. 2X Eastern and Virginia	2.25 to 2.75
No. 1X Eastern	2.75 and up
No. 1 Chicago	2.25 to 2.75
No. 2 foundry Eastern	1.75 to 2.25

No. 1X, eastern delivered Phila.	$38.10 to 39.10
No. 1X, Buffalo	37.00 to 39.00
No. 1 foundry, Chicago, furnace	36.25
No. 2 foundry, valley, Pittsburgh	35.40
No. 2 foundry, Buffalo	34.00 to 36.00
No. 2 Northern, Boston	35.90 to 36.90
No. 2 found y, Chicago furnace	35.00
No. 2 foundry, Ironton furnace	34.75
No. 2 foundry, Cleveland furnace	34.00 to 35.00
No. 2X, eastern del., Phila.	36.10 to 38.10
No. 2X, eastern, N. J. tidewater	36.10 to 38.10
No. 2X, eastern, Boston	36.90
No. 2X, foundry, Buffalo furnace	35.25 to 37.25
No. 2 foundry, del., Philadelphia	35.10 to 37.10
No. 2 foundry, N. J. tidewater	35.10 to 37.10
No. 2 southern, Birmingham	32.00 to 33.00
No. 2 southern, Cincinnati	35.60 to 36.60
No. 2 southern, Chicago	37.00 to 38.00
No. 2 southern, Phila.	38.50 to 39.50
No. 2 Southern, Cleveland	37.00 to 38.00
No. 2 southern, Boston	39.00
No. 2 southern, St. Louis	36.25 to 37.25
Virginia, No. 2X, furnace	35.00
Virginia, No. 2X, Philadelphia	39.10
Virginia, No. 2X, Jersey City	39.40
Virginia, No. 2X, Boston	39.70
Gray forge, valley, Pittsburgh	32.40
Gray forge, Buffalo	32.00 to 33.00
Gray forge, eastern Pa.	34.50
Silveries, 8% furnace	47.25 to 48.25
Ohio Silveries, 8%, Chicago	46.80
Tennessee Silveries, 8%, Chicago	48.65
Low phos. standard, Phila.	43.50 to44.00
Low phos. Lebanon, furnace	37.00
Low phos. standard, Pittsburgh	41.40
Charcoal, Superior, Chicago	35.50 to 38.00
Charcoal, Superior, Chicago first quarter 1920	35.50 to 37.50

Coke

(At the ovens)

Connellsville furnace	$5.45 to 6.25
Connellsville foundry	6.50 to 7.00
Pocahontas furnace, nominal	5.75 to 6.00
Pocahontas foundry, nominal	6.50 to 7.00
New River foundry, nominal	10.50 to 11.00
New River furnace, nominal	8.00 to 9.00
Wise county furnace, nominal	7.00 to 7.50
Wise county foundry, nominal	8.00 to 9.00

Ferroalloys

Ferromanganese, 80 per cent. delivered, domestic metal	$110.00
Ferromanganese, 80 per cent, English c.i.f. Atlantic ports	nominal
Spiegel, 18 to 22 per cent furnace, spot	35.00
Ferrosilicon, 50 per cent, spot and contract, delivered	80.00 to 85.00
Ferrotungsten, standard, per pound contained, furnace	1.10 to 1.20
Ferrochrome, 60 to 70 per cent chromium, 6 to 8 per cent carbon, per pound contained, maker's plant	27c to 29c
Ferrovanadium, 35 to 40 per cent per pound contained, according to analysis	$5.50 to $7.00
Ferro carbon-titanium, carloads, producers plant, per net ton	200.00
Bessemer, ferrosilicon, 10 pe cent	54.75 to 56.75
Bessemer, ferosilicon, 11 per cent	58.05 to 60.05
Bessemer, ferrosilicon, 12 per cent	61.35 to 63.35

Prices at Jackson and New Straitsville, O.

Semifinished Material

BILLETS AND BLOOMS

(4 x 4 inch)

Open-hearth, Pittsburgh	42.00 to 43.00
Open-hearth, Philadelphia	45.00 to 47.50
Open-hearth, Youngstown	40.50
Bessemer, Pittsburgh	42.00 to 43.00
Bessemer, Youngstown	40.50
Forging, Pittsburgh	51.00 to 53.00
Forging, Philadelphia	55.00 to 60.00

SHEET BARS

Open-hearth, Pittsburgh	$45.00
Open-hearth, Youngstown	45.00
Bessemer, Pittsburgh	45.00
Bessemer, Youngstown	45.00

SLABS

Pittsburgh and Youngstown	43.00

WIRE RODS AND SKELP

Wire rods, Pittsburgh	$60.00 to 63.00
Grooved skelp, Pittsburgh	2.45c
Sheared skelp, Pittsburgh	2.65c

Shapes, Plates and Bars

(In cents per pound)

Structural shapes, Pittsburgh	2.45c
Structural shapes, Philadelphia	2.695c to 2.925c
Structural shapes, New York	2.72c to 3.00c
Structural shapes, Chicago	2.72c
Tank plates, Pittsburgh	2.65c
Tank plates, Chicago	2.92c
Tank plates, Philadelphia	2.895c to 3.045c
Tank plates, New York	2.92c to 3.07c
Bars, soft steel, Pittsburgh	2.35c to 2.50c
Bars, soft steel, Chicago	2.62c
Bars, saft steel, New York	2.62c to 2.87c
Bars, saft steel, Philadelphia	2.595c to 2.845c
Bar iron, common, Phila.	2.995c to 3.245c
Bar iron, common, Chicago	2.77c to 3.00c
Bar iron, common, Cleveland	3.25c
Bar iron, common, New York	3.02c to 3.27c
Bar iron, common, Pittsburgh	3.25c
Hard steel bars, Chcago	2.85c

Rails, Track Material

Standard bessemer rails, mill	$45.00
Standard open-hearth rails, mill	47.00
Relaying rails, light, St. Louis	40.00 to 46.00
Relaying rails, Pittsburgh	40.00 to 43.00
Angle bars, Pittsburgh base	2.75c
Angle bars, Chicago base	2.75c
Light rails, 25 to 45, mill	$2.10 to 2.45
Spikes, railroad, Pittsburgh	3.35c
Track bolts, Pittsburgh	5.00c
Track bolts, Chicago	4.62c
Track spikes, Chicago	3.62c
Tie plates, Chicago	2.75c to 2.90c

Wire Products

(100 lbs. to jobbers, carloads; retailers, 5c more)

Wire nails, Pittsburgh	3.50c
Plain wire, Pittsburgh	3.10c to 3.25c
Galvanized wire, Pittsburgh	3.80c to 3.95c
Barbed wire, painted, Pitts	3.50c
Barbed wire, galvanized, Pitts	4.20c
Cut nails, Pittsburgh l. c. l.	5.195c
Coated nails per count keg, Pitts.	3.10c to 3.25c
Polished staples, Pittsbugh	3.50c
Galvanized staples, Pittsburgh	4.20c

Pig Iron Prices Still Advancing

Northern Foundry Market Reaches $34 to $37 and Southern Tonnage is Sold at $33 —Bessemer Reaches $34—Basic Situation Complicated by Producers Being Forced Into Market—Makers Selling More Cautiously

Pittsburgh, Pa., Nov. 25.—Although lacking the excitement which recently was displayed, the pig iron market here is not wanting in strength. An advance of fully $1.50 has been established on standard bessemer on sales to steel manufacturers, several thousand tons having been taken by one consumer at an average price of about $33, furnace. To have reached this average, some of the tonnage must have brought as high as $33.50, but such a quotation is not well established on sales for steelmaking purposes, although $34, furnace, has been paid for a lot of 3000 tons for delivery over the remainder of this year and the first quarter of 1920, while two lots of 500 tons each at the same price and for the same delivery, also have been sold. These tonnages are supposed to be for substitution for foundry iron. Basic grade again is laggard and while there have been reports of business at $31.80, furnace, verification is lacking. Failure of the price of basic to advance cannot be charged to back supplies or lack of demand. Actually supplies are extremely scant while several good sized inquiries are before makers. The Carbon Steel Co. is seeking 10,000 tons for first half of next year, while the N. G. Taylor Co., Cumberland, Md., has not yet covered on its requirements for the first quarter, although it was reported recently that it had. Renewals of this inquiry which is for 1200 tons a month for the first three months of 1920 has been made this week. The United Alloy Steel Corp., Canton, O., and the Trumbull Steel Co., Warren, O., still are seeking tonnages for early 1920 delivery. Merchant producers will not entertain bids around the price of the last sale and $32 to $33 is the present talking figure. Spot tonnages of foundry iron are salable at practically any price sellers see fit to ask. For No. 2 (1.75 to 2.25 silicon) $35, furnace, now is the minimum for this year and for first half year. None of the blast furnace interests now will consider less than $34, furnace, for this grade. One western Pennsylvania interest having three stacks reports less than 20,000 tons of foundry iron unsold for first half of a total production of approximately 150,000 tons and other makers are equally well off. Recent business in foundry iron for first half includes 4000 tons to a car wheel company, having several plants, at $32, furnace; 1200 tons to a Pittsburgh district consumer at the same price and for the same delivery; 1500 tons of No. 2 foundry to a Pittsburgh district car builder at $31.50 and a good sized tonnage of No. 2X (2.25 to 2.75 silicon) at $35.25, furnace. Sales of several hundred tons of malleable for shipment this year are noted at $35.25, valley furnace.

$35 Price Disappearing

New York, Nov. 24.—Buying of pig iron for 1920 delivery has reached proportions beyond which eastern furnaces do not think it safe to go at this time, and they are discouraging further business. Both $38 and $39, furnace, have been asked on 2.25 to 2.75 silicon for next year. These prices still are way in advance of the market. At the same time, several thousand tons of foundry grades have been sold during the past week at $36 and $37, eastern Pennsylvania, for 2.25 to 2.75 silicon, for shipment both this year and next, and the price of $35, furnace, which was representative of the bulk of the going business a week ago, now is disappearing. For 2.75 to 3.25 silicon $38, eastern Pennsylvania furnace, has been obtained for this year, and in view of the scarcity of this grade, this figure is not considered unusual. A number of furnaces have not opened books for next year, while others which are selling ahead, are restricting their orders to first quarter. One Virginia interest has come into the market for first quarter with a schedule of $34, furnace, for 1.75 to 2.25 silicon, $35 for 2.25 to 2.75, and $36, for 2.75 to 3.25, and has booked business on this basis. Southern iron is well sold up and the minimum figure that northern sellers have been able to obtain is $31, Birmingham, for 1.75 to 2.25 silicon. There is a fair amount of foreign inquiry but the high prices, the scarcity of iron and the unfavorable exchange, are said to be keeping this business away.

Little Tonnage is Available

Cleveland, Nov. 25.—The tonnage of pig iron offered for sale has grown increasingly scant as most of the sellers in this and surrounding territory either are out of the market entirely or are following very conservative policies in taking on additional tonnages. Supplies of basic especially are extremely limited. A number of interests including both producers and consumers who have been seeking to obtain tonnages of this grade have met with little success. The two producers who have been forced into the market by difficulties with their furnaces are inquiring for round lots. One of them wants 6000 to 8000 tons and the other who was a purchaser of 2500 tons last week as reported, is still out for 3500 tons additional. The basic market is indefinite at present and

makers apparently are unwilling to entertain any business under $32 or $33 furnace. A small lot of valley basic western delivery was closed at $31.50 furnace. Foundry iron also is very scarce and has advanced further in the week. Where the last previous sales by Cleveland makers were at $32 and $33 furnace for 1.75 to 2.25 silicon, moderate lots have been booked within the week at $35 furnace for the base grade. Local makers, however, are willing to sell very little additional tonnage at present. Sales of valley No. 2 (1.75 to 2.25 silicon) in lots of 100 to 200 tons are noted at $34 furnace, and of malleable at $35.50 furnace. A heavy tonnage of foundry and malleable iron for automobile interests in the Detroit district remains uncovered. New inquiry is not in heavy volume but apparently exceeds the amount of iron offered. Production locally is improving through better operating efficiency at the different stacks.

Foundry Iron Scarce

Cincinnati, Nov. 24.—A small tonnage of valley foundry iron (1.75 to 2.25 silicon) has been purchased recently by melters in this vicinity at $34, furnace. The supply has practically been exhausted, and with the exception of special iron in the South there is nothing to offer the foundries in any district. All southern producers have now withdrawn, but one interest is understood to be taking care of a few customers at $32, Birmingham, or an advance of $1 per ton over its last week's quotation. In the Hanging Rock district no foundry iron is to be had, but a furnace farther north is disposing of some malleable. It is reported that the last lot of malleable sold brought over $36, furnace. The last quotation on southern Ohio No. 2 foundry iron (1.75 to 2.25 silicon) was $34.75, Ironton, but none is offered at any figure at present, although there is a heavy inquiry for both first and second quarter shipment.

Prices Continue to Advance

St. Louis, Nov. 24.—The pig iron market has slowed down a bit, due to the fact that supplies are low, and the coal strike threatens to close certain industrial plants. There is no decline in the demand, however, and prices continue to advance. At the close of the week No. 2 southern (1.25 to 1.75 silicon) was quoted at from $33 to $35 for 1919 shipment, and $37 for next year's delivery is being asked for 2.25 to 3.25 silicon. Chicago and valley iron is quoted at $35 for 1.75 to 2.25 silicon. More furnaces are reported out of the market for all deliveries. All consumers are deluged with business, and are making every effort to acquire raw material. Foundries are offering premiums for reasonably prompt shipments. Deliveries from the South are fair, and a few more consignments are arriving from Chicago, Ohio and Michigan points, but scarcity of coal threatens to upset transportation. Sales of various grades of iron during the past week or 10 days run from 20,000 to 25,000 tons in this district, and it is safe to say a fourth as much more could have been placed had the grades desired been available. There has been a good inquiry for malleable iron, one user wanting 700 tons, while other plants are asking for lots ranging from 200 to 500 tons. Some inquiries have been received for unusual grades, among them one for 100 tons of spiegeleisen and small lots of silvery, aggregating about 400 tons.

First-Half Iron Sold at $33

Birmingham, Nov. 25.—Sales of No. 2 foundry iron for delivery in the first half of 1920 have been made in the Birmingham district at $33. A majority of the furnaces, however, are still out of the market. Southern companies are receiving many urgent inquiries. Spot iron is very scarce and some of the companies which have been selling freely into 1920 now show less inclination to do so. Production is still below normal, as fires are banked in three or four furnaces because of the scarcity of coal and coke.

New England Market Tightens

Boston, Nov. 24.—The New England pig iron market suddenly tightened up when several of the furnaces which were offering large blocks of 1920 iron a week ago, closed their books. At present 1920 iron is almost entirely absent from the local market. No Buffalo iron is available, although it is rumored that two of the Susquehanna furnaces have blown in. In rare cases eastern Pennsylvania furnaces are accepting orders from old customers for small tonnages. Sales show a wide spread. A sale of over 500 tons at $37 at an eastern Pennsylvania furnace for No. 2X (2.25 to 2.75 silicon) is reported. One furnace agent reports a sale of 2.75 silicon at $39, eastern Pennsylvania furnace. Sales from the Virginia district have been mostly of special analysis iron, and while a fair tonnage has been moving to New England, it is difficult to determine a market price. Most of the furnaces have announced they are out of the market, but small orders are being accepted. Several of these have been reported at $34, furnace, for 1.75 to 2.25 silicon, though it is doubtful whether any sizable tonnage could be placed under $35. The southern furnaces also are out of the market, but one at least is ready to accept a fair amount of business. Inquiry at present, while in excess of available iron for 1920 is for comparatively small tonnages and in many cases for special analysis iron. One eastern Massachusetts consumer wants 300 tons of 6 per cent silicon iron for prompt or first quarter delivery, and so far no furnace east of Ohio has been able to quote on this tonnage. A western Massachusetts consumer wants 200 tons of 3.25 to 3.75 silicon for prompt delivery and a Connecticut consumer a fair tonnage of malleable. High prices generally have forced much resale iron onto the market and rumors of $43 to $45, delivered, for No. 2X iron are circulating.

Demand Exceeds Supply

Chicago, Nov. 25.—Pig iron melters need much more iron than they have been able to buy and many inquiries for first half fail to bring out offers. Local producers are entirely out of the market, and no sales of northern iron have been made recently except occasional carloads to established customers. On this business $35, furnace, has prevailed. Most southern producers have been out of the market, but one interest has been selling some iron for first quarter recently on the basis of $33, Birmingham, while another has disposed of approximately 10,000 tons at from $32 to $34, Birmingham. Not only are melters in this district drawing supplies from the South, but also from the valleys and even farther east. A malleable melter in Michigan recently closed for 1500 tons, part of which will come from the valleys. A stove manufacturer in Wisconsin has placed 600 and 100 tons of malleable and 1500 and 2000 tons of foundry. An important Wisconsin melter bought 5000 to 6000 tons of foundry, and an inquiry from another Wisconsin melter is for 2000 tons of foundry. The Virginia Iron, Coal & Coke Co. has made tentative offers of first half iron at $35, furnace. Low phosphorus iron has been active, and a Chicago consumer recently inquiring for 3000 tons, is believed to have placed the business. The Ford Motor Co., which has been in the market for a large tonnage, has placed about 8000 tons with southern makers. The Western Electric Co. has just closed for 1000 tons of southern at $34, Birmingham. Settlement of the strike at Jackson county furnaces producing silveries promises to relieve the shortage in the metal soon. A southern producer of silveries is offering some material at $48.25, Birmingham, for 8 per cent, which figures out $53.25, Chicago. Sales have been made of 8 per cent silvery at $50, delivered Chicago.

Three Prices Prevail in Buffalo

Buffalo, Nov. 25.—Three separate pig iron prices are now quoted in this market. One producer is asking $34 for No. 2 foundry (1.75 to 2.25 silicon), another $35 and another $36. On No. 2X foundry (2.25 to 2.75 silicon), one producer is quoting $35.25, another $36.25 and another $37.25. On No. 1X foundry prices are $37, $38 and $39. The high quotation is exclusively for first quarter shipment. The intermediate price is for first quarter, with occasionally a little tonnage of prompt; and the low quotation is for first quarter iron. The last quotation is made by a furnace which is just beginning to come back into production after losing time due to the steel strike. One producer is said to have sold 6500 tons of basic during the week for first half at about $32 to $34. It is now quoting basic at $36. Malleable iron is held at $36.25. Tonnages of all grades are taken up as soon as offered and there is little iron available for prompt delivery.

Eastern Prices Advance Rapidly

Philadelphia, Nov. 25.—Foundry iron prices again are advancing rapidly and $38 for No. 2X (2.25 to 2.75 silicon) and $37 for No. 2 plain (1.75 to 2.25 silicon) already has been obtained at eastern Pennsylvania furnace for next year. One furnace has refused

business at this level. The usual prices of the past few days on No. 2X eastern Pennsylvania furnace have been $36.00, $36.50 and $37.00. No more is heard of $34 and $35 excepting where they were quoted previously and now are being taken up. Several eastern furnaces have sold more than three-fourths of their firsthalf output. As an example of current tendencies, a small lot of Buffalo No. 2X for spot, western shipment was sold at $39, Buffalo. No Buffalo iron now is being offered here. Central Pennsylvania No. 2X for this year has been sold at $36 furnace and some for next year at $36.50 for this district. Virginia prices are up. No. 2 plain is now $34 furnace and No. 2X $35 for this year. One Virginia maker having mainly high silicon iron is quoting $34 for No. 2 plain, $35.25 for No. 2X and $37 for No. 1X. The Virginia Iron, Coal & Coke Co. now is in market for first quarter with prices of $35 for No. 2 plain, $36.25 for No. 2X, $38 for No. 1X and $40 for 3.25 to 3.75 silicon and has sold at this level. It expects to sell mainly $40 grade. It is difficult to estimate the foundry business of the past week but it ran into many thousands of tons. A lot of 3000 tons of gray forge was sold the past week for first quarter at $33.50 eastern Pennsylvania furnace. At least 8000 tons of Pennsylvania malleable were sold at $35 furnace for this year and at $35.50 furnace for first quarter. Over 3000 tons of copper bearing low phosphorus was sold for first quarter and first half at $37 furnace in addition to recently reported sales of standard low phosphorus, 3000 tons were sold for first half at $43.50 delivered this district. Some eastern bessemer is available but no price has been named yet. Incidentally $42 eastern furnace now is being asked for standard low phosphorus. About 1000 tons of basic were sold for first quarter but this was of special analysis and had no bearing on the market. While there is some export inquiry, exchange prevents buying. Producers say that were it not for exchange situation, foreign buying would have resulted in even more acute pig iron scarcity than now prevails here.

Ore Moving More Freely to Furnaces

Cleveland, Nov. 25.—Ore is moving along to the furnaces more freely than at any time since the beginning of the steel strike, but shipments from the upper lakes have come almost to a halt. The Missabe dock at Duluth will be closed for the season Nov. 26 and many ore carriers awaiting cargoes there will not be loaded. Shipments from the mines to docks have stopped, although it is expected to load carriers at some of the docks up to the end of the month. Market conditions are stagnant, thus far no business for 1920 being offered.

The common stock of the recently reorganized Otis Steel Co., Cleveland, made its appearance upon the New York stock exchange last week, with first quotations of around 38. Plants of the company although affected by the steel strike are speedily resuming normal operations, officials report.

Spot Coke Now Plentiful

Bulk of Business in Standard 48-hour Fuel Done at $6 For Prompt Shipment—Production in Advance of Demand

Pittsburgh, Nov. 25.—Spot supplies of both furnace and foundry coke are a little more plentiful than recently and while the range of prices does not vary much from that of a week ago, the higher quotations do not find a general basis in sales, and are somewhat extreme. Standard 48-hour beehive fuel for spot or prompt shipment still has a range of $6 to $6.25, ovens, but the great bulk of the business is at the lower figure. A sale of 200 cars at $6, oven, is noted. Production continues to gain and now is somewhat ahead of the current demands. While occasional spot sales of foundry coke are taking place at higher than $7, ovens, that price is the more general maximum and $6.50 is finding more basis in sales than it did recently. A number of beehive-oven operators lately have been shipping Monday and Tuesday drawings as foundry grade, and the situation also has been weakened by the fact that a number of foundries, short of pig iron, have asked that shipments against contracts be held up. Negotiations are being actively conducted for first-half furnace coke. On fixed price contracts, $6, ovens, has been done with a provision for a higher price in the event wages are increased. Eastern furnace interests were the buyers. It is doubtful if less than that now would be accepted by producers and it is reported that brokers have bid $6.50 for first half tonnages. Sliding scale contracts are being considered in a number of pending deals and some business has been closed on a basis of 5½ to 1 on basic iron, valley furnace. About 6000 tons a month is involved and this provides the basis for the quotation of $5.45, although none of the coke may move at that price, as basic iron may be higher by Jan. 1, when shipments are to start. Other deals are pending on a 5 to 1 basis and some that will mean an even higher price for coke even than that. Such first half business as has been closed in standard 72-hour fuel has been at $6.50 to $6.75, ovens, but operators now will not consider less than the latter figure and some have even more exalted price ideas. Connellsville production of coke for the week ended Nov. 15, is estimated by *The Connellsville Courier* to have been 253,924 tons, against 248,676 tons in the previous week.

Demand Continues Active

New York, Nov. 24.—Active buying continues to feature the coke market, principally for spot shipment, but also for first half. Included in the business of the past week was considerable beehive furnace coke which went at $6.10 to $6.25, Connellsville, both for spot and first half. Beehive foundry coke is bringing $6.75 to $7, Connellsville, both for spot and first half. On northern New Jersey by-product coke, $7, Connellsville, continues to be the price for all deliveries this year, as well as for first half in this district. For first half shipment to New England, however, the northern New Jersey by-product producer is asking $7.50, Connellsville.

Spot Coke in Better Demand

Cincinnati, Nov. 24.—Both spot furnace and foundry coke is said to be in better demand in the Connellsville field. Furnace coke also is wanted for nearby shipment for filling in. The local consumption of foundry coke is well up to normal and most foundries seem to be well supplied, although occasional purchases are necessary. Outside foundries do not seem to be so well fixed and are willing to pay advances on standard brands of coke that can be had for shipment desired. Connellsville furnace coke ranges from $5.75 to $6.25 and foundry grades from $7 to $7.50, ovens. Wise county foundry grades are quoted around $8.50 to $9, and New River is unchanged at $10.50 to $11.20. As high as $12 has been paid on some New River foundry fuel. Gondola cars are again becoming scarcer, and frequently coke shipments have to be sent forward in covered cars.

Good Demand at St. Louis

St. Louis, Nov. 25.—Demand for coke in this district continues good, and supplies are more plentiful. Coal mines supplying ovens which make a good part of the coke used in this district have not closed, and production is on a fairly liberal scale. Cars are more plentiful in the East, and coke is being shipped about as rapidly as produced. Business is largely for prompt or nearby delivery, as virtually all the leading oven interests seem willing to wait before selling heavily into next year. Foundry coke is quoted at $6.75 to $7.50. Dealers report an excellent inquiry from the West, with good tonnages sold as far as California. A number of inquiries were received from Arizona and New Mexico for both foundry and furnace grades. Consumption by smelters has been reduced by labor troubles and car shortage. The recent advance in lead and zinc prices, however, is expected to revive activities. The leading by-product interest here, which obtains its coal from outside the strike zone, has been working at capacity to date and is finding an excellent market for its product.

Southern Ovens Resuming

Birmingham, Ala., Nov. 25.—Coke production in Alabama is still far from being satisfactory. Manufacturers are resuming work at ovens where possible, and output may become normal this week. No new business is being considered. Production of coal is less than 80 per cent of normal.

Because of fuel shortage, British pig-iron production is down to 575,000 tons monthly compared with an average of 625,000 tons for the year to date, 755,000 tons in 1918 and 855,000 tons in 1917.

Coal Strike Hits Scrap

Some Grades of Old Material Held Back by Interruption of Plants —Strong Market in East and Pittsburgh

FOR COMPLETE SCRAP PRICES SEE PAGE 1486

Chicago, Nov. 25.—Actual and prospective shortage of fuel as a result of the present coal strike is putting a damper on some grades of iron and steel scrap, but some consumers who are affected by the shortage of fuel have not let up in their efforts to buy raw material. Rerolling mills are either closed from lack of fuel, or face an early shutdown. Because of the acute shortage of rerolling rails, however, this condition has not resulted in diminution of buying. These mills realize they will need all the rails available well into next year, and as a result they are not letting any material of this character pass them. Steel grades are not moving readily owing to the curtailed buying. Difficulty in obtaining pig iron has caused foundries to seek cast scrap, which is active and is bringing higher prices. Railroad offerings are not many and this source is not yielding its usual tonnage. The Rock Island offers 3300 tons, and the Chicago, Burlington & Quincy 5565 tons. In the latter list is 1000 tons of No. 1 steel rails.

New York Prices Advanced Again

New York, Nov. 24.—A general advance again features the local scrap market. Heavy melting steel has gone up another half dollar, holding at $17.50 to $18 f.o.b. New York. A similar increase has been made in the price of clean cast borings and machine shop turnings. Grate bars, stove plate and wrought pipe and railroad wrought have advanced $1. Heavy cast and machinery cast appear among the few items to remain unchanged, the market on these descriptions holding at $23.50 to $24 and $25 to $26, f.o.b. New York, respectively. With indications pointing to still higher prices, holders generally are backward about disposing of their supplies, which appear plentiful.

Holding for Higher Prices

Philadelphia, Nov. 25.—While heavy melting steel is quoted at $21 to $22 delivered it is doubtful whether any tonnage could be had at this level as dealers are holding for higher. A round tonnage of eastern steel has been sold at $24 delivered Pittsburgh. Rerolling rails have been sold at $32 delivered eastern Pennsylvania. Almost every grade on the list has advanced. While there is a big unsatisfied demand, dealers are holding for higher prices than the present market. Sales generally are less than 1000 tons each.

Prices Are Advancing Rapidly

Pittsburgh, Nov. 25.—Consumers of scrap iron and steel in the Pittsburgh district are showing more interest, and find it impossible to pick up tonnages except at sharply higher prices. Dealers are holding on firmly to open-hearth grades and the dearth of offerings is further intensified by the fact that valley steel manufacturers are buying up supplies at extremely high prices. It is reported that a Massillon, O., steel manufacturer recently made a large purchase of heavy melting steel and paid $25.75 per gross ton, delivered. A Youngstown, O., steel manufacturer is said to have paid $25, delivered, for a substantial tonnage of this grade, and while small tonnages have been moved here at $22.50 to $23, a bid of $23.50 on 6000 tons was refused by a shipper, whose price was $24. The strength of the market in this grade is finding reflection in prices of other open-hearth material. Baled sheets recently have sold at $21, delivered, and it is doubtful if they could be had today under $21.50. Users of machine shop turnings have offered up to $15 for this grade and a steel manufacturer is reported to have paid $28 to $29, delivered, for a tonnage of heavy machinery scrap. The market is extremely short of all kinds of cast scrap.

Market Is Looking Better

Cleveland, Nov. 25.—Scrap iron and steel continues to look up. Heavy melting steel is far below pig iron, and the wider this spread becomes the more confident local scrap dealers are that early 1920 prices will be most satisfactory to them. A Lorain, O., melter is reported to have bought from 10,000 to 15,000 tons of melting steel, up to as high as $23, delivered. Rerolling rails are extremely short, an offer of $30 delivered Pittsburgh with a freight $1.50 from Cleveland having appeared in the local market. No activity is reported in busheling. One local scrap dealer paid $30.50 for some No. 1 cast a few days ago and was able to dispose of it at a good profit. The local buyer of malleable places the market around $26. A dealer claims to be willing to take a good tonnage of blast furnace turnings at $14.50, $1 above the quotation. Some machine shop turnings are reported having been purchased here at $13.60 plant, meaning about $14 delivered consumers' works. Axle turnings are in demand, with practically none available.

Some Grades Increased

Cincinnati, Nov. 24.—The scrap market is advancing slowly, as the coal strike having an adverse effect. Consumption of scrap has been curtailed in a number of rolling mills, especially those in Indiana which are short of fuel. Heavy melting steel is holding its own and an advance of approximately $1 per ton is reported on both No. 1 machine cast and on cast borings. The car shortage still is causing considerable annoyance.

St. Louis Market Soft

St. Louis, Nov. 22.—The bottom has fallen out of the scrap market, due to the coal strike. Threatened with the possibility of having to close down, leading industries stopped buying, and asked that shipments be held up. There had been heavy sales and large accumulations on the recent upturn, and with the halt in consumptive activities smaller dealers and yard interests displayed a feverish desire to sell. Heavy offerings of a variety of grades at radically lower prices were reported, but virtually no trading was done, so that dealers failed to make any revisions in the price lists. Several of the larger plants and heaviest consumers of scrap either closed down last week or announced they would do so soon unless the coal strike was settled. Despite the softness of the market, cast and malleable grades are in strong demand and scarce, and the same is true of other varieties. New offerings were not heavy, the only railroad list being one from the Missouri, Kansas & Texas for 875 tons. Little material is coming in from the country.

Southern Prices Shaded

Birmingham, Ala., Nov. 25.—No. 1 cast and stove plate scrap continue to be most in demand, although considerable heavy melting steel is being used. Consumers are not paying the prices announced by dealers as the market quotations. Stocks on hand are being fairly well maintained.

Prices Advance at Buffalo

Buffalo, Nov. 25.—The price of heavy melting steel in this district is $22.50 to $23 delivered. It is reported that 15,000 tons of this grade has been placed with a local plant at $23 delivered. Inquiry for this material far exceeds supply and is driving up the price. Offers of $22.50 for this grade have been rejected by local dealers. Low phosphorus is up $1. Fairly good sales of machine shop turnings have been made. There is strong activity in all the other grades, and many of them have taken an upward trend.

Cast Scrap is Higher

Boston, Nov. 24.—An urgent demand for cast scrap has caused prices, already high, to mount even higher during the last few days. The amount of scrap accumulating for foundry use is entirely inadequate to the needs and the market tightness in pig iron has aggravated this general condition. Dealers have paid as high as $30 for No. 1 machinery which is the highest point reached since the signing of the armistice. Malleable is also in demand and heavy melting steel while in no way enjoying the activity of the foundry grades, has been moving to the steel centers in large tonnages than for some time. The shortage of cars further south has diverted considerable business to this territory where as yet open top cars are plentiful.

Stocks Are Depleted

New York, Nov. 24.—Stocks in local warehouses are said to be in poor shape. This is particularly true of bars, sheets, small shapes and hoops and bands. The steel strike

has virtually played out, but so heavy are the bookings of the mills that shipments to the local warehouses have improved little, if any. Buyers are accepting substitutions in many instances, while in some cases they are forced to go without after thoroughly scouring the market. This situation has naturally made prices very strong, and advances in some products are expected before the week is over. A better demand for heavy structurals and plates is anticipated as the eastern mills generally are said to be booked several weeks ahead.

Rising Prices

Continue in Semifinished Steel—Sheet Bars Sell at $46.50

Cleveland, Nov. 25.—Some new business in sheet bars in the form of extensions of present contracts into next year have been made by sellers in this district on the basis of $46.50 mill.

Billets Sold at $45

Philadelphia, Nov. 25.—One thousand tons of rerolling billets have been sold to an eastern user at $45, Pittsburgh. Another lot of 2000 tons has been offered at $46 without finding a taker. Billets are far from plentiful.

Premiums Offered on Early Tonnages

Pittsburgh, Nov. 25.—While production of billets, sheet bars and other forms of semifinished steel is gaining steadily, it is not yet sufficient to keep all consumers fully supplied, and there is a strong demand for limited tonnages appearing on the open market. Little new business is reported here in sheet bars, due to the fact that practically all of the current production of Pittsburgh and valley plants is being applied to existing contracts. It is doubtful, however, if a price of less than $45 could be done, and that quotation is nominal, in the lack of any sizable sales. Attempts on the part of some buyers to secure prompt tonnages of standard billets have brought about quotations up to $46, but no sales have been made that high and from $42 to $43 is regarded as the approximate range at present. Sales of wire rods continue to be made at anywhere from $60 to $63 and as high as $57 has been paid for some off-grade material. Demand for rods outruns the supply and such high prices are obtainable on nails and other wire products for early shipment that the manufacturers are inclined to put the price secondary to securing supplies.

Report Sheet Bars at $47

Youngstown, O., Nov. 25.—Few sheet bars, if any, can be bought in this district at the old price of $42. The market for this product is tightening right along. A few tonnages have been closed at $45 which seems to be the average sale price now in effect here. Tonnages are hard to place in view of a future steel shortage and a rising market. Considerable tonnage of open-hearth sheet bars, it is heard, was sold by one mill here this week at $47. Approximately 2000 tons of soft, open-hearth sheet bars were offered in this market recently at $42, Baltimore.

Much Work Now Figured

Structural Awards Less Numerous But Many Plans Are Before Shops—6000 Ton Job in East—Eastern Mills Raise Shapes

New York, Nov. 24.—Outstanding among awards in the eastern structural market is the placing of 6000 tons with the American Bridge Co. for an office building in Philadelphia for the Atlantic Refining Co. This fabricator also was awarded 600 tons for a boiler plant for the Standard Oil Co., at Toledo, O. Other sizable contracts include 1100 tons for a department store in Springfield, Mass., this business going to Levering & Garrigues. New inquiries of importance have been few relatively during the past week. Perhaps the largest calls for 1600 tons for plant construction in Atlanta, Ga., by the Tennessee Copper & Chemical Co., New York. The final date for receiving bids on the heat-treating building at the government armor plate plant at Charleston, W. Va., has been postponed until next month. The drydock for the Baltimore Drydock & Shipbuilding Co., Baltimore, on which bids were asked for approximately 1700 tons, is to be erected of wood, in accordance with a recent change in plans.

More Activity at Boston

Boston, Nov. 24.—Conditions in the structural steel market are improving. The Pittsburgh base price still holds for mill shipments to New England, but the increased lettings, demand on warehouses, and the difficulty in getting prompt deliveries, all tend toward a rising market.

Eastern Prices Advancing

Philadelphia, Nov. 25.—Prices of shapes are advancing rapidly. One eastern mill has a minimum of 2.65c mill, on all business. Another has a minimum of 2.60c mill. On some tonnage of 2.75c and 2.80c, eastern mill, has been done. One eastern mill has a minimum of 3.00c, mill, on bar-size angles, but most makers are still quoting 2.45c, Pittsburgh. Mills are not in a position to make quick delivery of any considerable tonnage business. Durings the past week many thousands of tons, including nearly 4000 tons of ship shapes for Pacific coast yards have been placed in the East. Several thousand tons of ship shapes for export also have been placed. A big shape inquiry is pending, including one lot of 6000 tons. The Belmont Iron Works has 3000 tons for a sheet and tin mill for Follansbee Bros. Co., Toronto, O.

Mills Well Sold Up

Pittsburgh, Nov. 25.—Shape mills in this district are fairly well committed as a result of the demands from consumers not ordinarily served from Pittsburgh, but if there is a scarcity of prompt tonnage it is the smaller sizes, for it is in these that the bookings, both domestic and export, are heaviest. Most makers can take on early business in the larger sizes of angles, beams and channels. This has been a season of light material, not only in shapes, but also in bars and plates. Little premium business in shapes is noted here, although a St. Louis maker of sashes recently was in the market for a prompt tonnage of small angles and offered more than the market price.

Small Tonnages in Demand

Cleveland, Nov. 25.—An unusual amount of business for this time of year is developing in the demand for small tonnages of shapes, but fabricators for the first time this season report a lack of new building projects calling for large orders. Several large projects on which bids have been taken are hanging fire, and contracts are still to be awarded calling for early delivery. The only new job on which figures are being taken is one for 1500 tons for a rim plant to be built in Akron, O., by the Goodyear Tire & Rubber Co. The May Co., Cleveland, is understood to be inquiring for 1500 tons for a new store. Fabricators report a scarcity of labor not only in the shops but among the structural steel workers.

West Keeps Up Demand

Chicago, Nov. 25.—Inquiry for structural material continues strong in western territory with numerous projects being closed each week. The First & Old National bank, Detroit, is considering bids on 4500 tons for a new bank building. The May store at Cleveland is asking bids on 1500 tons for an addition. The Noel State bank, Chicago, asks bids on 250 tons.

CONTRACTS AWARDED

Tradesmen's State Bank at Oklahoma City, Okla., 566 tons, to Morava Construction Co.

Colorado State office building, Denver, 417 tons, to Midwest Steel & Iron Co.

Factory buildings for the Duluth Show Case Co., Duluth, Minn., 104 tons, to National Iron Works.

Office building for Atlantic Refining Co., Philadelphia, 6000 tons; to the American Bridge Co.

Boiler house for Standard Oil Co., Toledo, 600 tons; let through James Stewart & Co., New York City, to the American Bridge Co.

Department store in Springfield, Mass., 1100 tons; to Levering & Garrigues.

Apartment house in Baltimore, 500 tons; to the Chesapeake Iron Works.

Building in Philadelphia, 300 tons; to Phoenix Bridge Co.

Building for Gotham bank, New York City, 900 tons; to Hunkle Iron Co.

Hoffman's Palace theater, Cleveland, 100 tons; let to Republic Structural Steel Co.

New sheet and tin plate plant for Follansbee Bros. Co., Toronto, O., 3000 tons to Belmont Iron Works.

CONTRACTS PENDING

Heat treating department for government armor plant, Charleston, W. Va., about 1600 tons; closing date for bids postponed until next month.

Plant additions for Tennessee Copper & Chemical Co., Atlanta, Ga., 1600 tons, pending.

Bank building for First & Old National Bank Detroit, 4500 tons, bids taken.

Addition for the May Store, Cleveland, 1500 tons bids asked.

Power house for the Continental Motors Co., Muskegon, Mich., 640 tons, bids asked by The Arnold Co.

Addition for the Western Electric Co., Chicago, 400 tons, bids being taken.

Theater for the Industrial investment Co., Minneapolis, 250 tons, bids asked.

Building for Noel State Bank, Chicago, 250 tons, bids asked.

Rim plant for Goodyear Tire & Rubber Co., Akron, O., 1500 tons; bids being taken.

Building for Mullen Boat Co., Salem, O., 700 tons, bids being taken.

Bar Prices Are Bid Up

Intensity of Demand From Buyers Forcing up Market—3.00c Done in East—Chicago Mill Declines Much Tonnage

Chicago, Nov. 25.—Mills are unable to accommodate more than a small portion of present inquiry for soft steel bars as this product is in much heavier demand than plates or shapes. As a result of the sold-up condition of mills, inquiries are being scrutinized carefully and new business is accepted only from regular customers. As a rule it is not possible for the mills to give the latter as much as they ask. The market is steady at 2.62c, Chicago. Mills are operating at much better rate each week, and one important producer finds output for the first half of November is considerably in excess of the entire tonnage rolled during October.

Buying of bar iron is excellent and steady operation over the remainder of the year is assured as far as orders are concerned, and if the coal strike interferes materially this will carry a considerable tonnage over into next year. The minimum quotation at present seems to be 2.77c, Chicago, with some quotations running as high as 3.00c, Chicago. This volume of business has been attained without participation by the railroads.

Bands are under heavy demand and present bookings cover maximum production of most producers for about six weeks. The quotation is 3.02c, base.

Hard steel bar mills have ceased selling because of fuel difficulties and heavy bookings. The final price was 2.85c, base, mill, but with advanced cost of fuel, transportation and old rails, it is confidently believed that when selling is resumed the quotation will be at least 3.00c, mill.

Consumers Bid Up Price

New York, Nov. 24.—Independent steel bar makers say that despite their attitude of moderation as to advancing prices, it seems almost certain that the anxiety of consumers to obtain their requirements will have the effect of bidding up the market. In a great many instances, consumers have insisted on covering themselves for first quarter, and this they have done to such an extent, that some makers now are completely sold up for the first quarter. Much of this first quarter business has been taken at 2.50c, Pittsburgh, for steel bars of ordinary quality and at 2.85c, Pittsburgh, for bars of forging quality. In numerous instances, consumers have insisted upon covering themselves for second quarter, and particularly where it is necessary for the consumers to dispose of their second quarter manufactured products at this time. In booking second quarter business, the mills have been making an allowance for increased costs at that time, although they have no assurance as to just how much these increases will be. It is interesting to note, however, that a considerable portion of the second quarter business which has been booked has been taken on the basis of 3.00c, Pittsburgh, for ordinary steel bars, and 3.25c, Pittsburgh, for steel bars of forging quality. The reason for the additional 10-cent premium which now is being asked for steel bars of forging quality as compared with ordinary commercial bars is the difficulty in obtaining chippers due to the shortage of labor. An eastern buyer has closed for 1500 tons of concrete reinforcing bars for Detroit delivery at 3.50c, Pittsburgh.

Bars Scarce, Selling Higher

Philadelphia, Nov. 25.—Steel bars are scarce and are bringing prices ranging from 2.50c to 3.00c, Pittsburgh, and higher, for prompt shipment. Rivet rods are being sold at 3.50c. Bars of forging quality are bringing 3.25c, Pittsburgh, for any delivery. Twisted reinforcing bars have been sold as high as 3.50c Pittsburgh. The minimum on bar iron is 2.75c, Pittsburgh, and as high as 3.50c is asked on common quality for quick shipment.

Shortage Still Unrelieved

Pittsburgh, Nov. 25.—The shortage of merchant steel bars for early delivery remains extremely acute and those consumers who must have supplies are obliged to pay substantial premiums. The Carnegie Steel Co., and some of the larger independents still are quoting a 2.35c base to regular customers. They are so heavily committed they are unable to enter new business for shipment over the first quarter at that figure. Several of the independent companies are holding at 2.50, Pittsburgh, but if they are entering any new business for future delivery it is with the understanding that the material will take the price which pervails at the time ff delivery. One maker of forging bars in a position to make fairly prompt delivery is quoting 3.90c base, Pittsburgh. Makers of iron bars are heavily sold up and are declining orders from all but their regular customers.

Mills Turn Business Down

Buffalo, Nov. 25.—Bar mills here can have all the business they care to handle. They are all turning away tonnage. Inquiries are for small and large tonnages. One mill has received several inquiries for 5000 to 10,000 tons. This mill has been offered as high as 3.25c and even 3.50c for quick delivery.

Small Sizes Are Scarce

Cleveland, O., Nov. 25.—An acute shortage of bars either soft or special quality under 1-inch size has developed and buyers are searching in all directions for this material. The question of prices appear secondary. As much tonnage as can be had is being taken from warehouses but such supplies are so depleted that only a small fraction of this demand is being filled. The 2.35c base price is so restricted to regular customers of the largest interests that it has become largely nominal at 2.50c and higher is being paid readily. An inquiry for 3000 tons of reinforced bars for a rubber manufacturing plant in this district is current. Reinforced bars are being held at 2.75c to 3.00c in all. Rivet manufacturers now are accepting first-quarter contracts at the old figure of 3.90c for structural Pittsburgh, 4.00c for boilers and 5.50c and 10 off for small rivets.

Bolt Demand Heavy

Chicago, Nov. 25.—Consumers of nuts and bolts are inquiring for large quantities and find it difficult to place this business with producers. One lot of 1,200,000 bolts was recently placed in the Chicago district. Most producers are sold through last quarter, and no new business is being booked for delivery before Jan. 1, 1920.

Substitute Ties for Hoops

Pittsburgh, Nov. 25.—So short is the present supply of hoops that cases are reported where buyers in their anxiety to secure supplies have substituted cotton ties. Most makers have some surplus of ties due to the fact that they rolled more heavily than was necessary for this year's cotton crop.

Bar Shortage Still Felt

Pittsburgh, Nov. 25.—Makers of cold finished steel bars, except those who make their own merchant bars, still are operating on a rather restricted scale because of their inability to secure cars. Demands still are heavy, particularly in the smaller sizes of squares and rounds and for screw stock. Obligations of all makers are piling up steadily and new business is not being booked unless buyers are willing to wait for delivery and then to pay the prices which prevail at time of delivery.

Sheet Mills Need Fuel

Production Again Threatened by Coal Situation—Famine Prevails in Early Material—First Quarter Contracts Closed

Pittsburgh, Nov. 25.—Although the number of active sheet mills is greater now than it has been at any time since Sept. 22 and independent manufacturers actually have more capacity in use than they did just prior to the steel strike, the failure of the union coal miners to go back to work and the consequent shortage of fuel threatens to bring about a reversal of these conditions. The fear is expressed in some quarters that unless coal is available in more generous amounts in the next six days that the number of active sheet mills may fall to an even lower notch than during the worst time of the strike period. While the American Sheet & Tin Plate Co. today is operating about 93 per cent of its sheet mills and independent capacity in use is around 85 per cent, production does not approximate these figures due to the fact that a large number of mills

are employing inexperienced hands. There is almost a famine of sheets for early delivery, and in view of the large carry-over of orders from this year, it probably will be well in the first quarter of 1920 before anything like normal conditions are restored. The American Sheet & Tin Plate Co. will prorate its production during the first half of next year and this fact will throw additional demands on the independents. Business for early 1920 delivery is being taken at the old quotations, but it is understood big premiums are being offered by buyers who must have immediate supplies. A small sale of galvanized sheets recently was made at 6.25c base, Pittsburgh. It is stated that a high price was named for the purpose of discouraging the purchaser.

Sell at Open Prices

Chicago Nov. 25.—The leading independent sheetmaker in Chicago has begun booking contracts for second quarter of 1920 on the basis of about one-half the requirements of its regular customers. The contracts carry no price and the sheets are to be paid for at the price ruling at the time of delivery. Heavy demand for sheets is evident but practically all producers are in a position requiring them to refrain from booking further tonnage.

First Quarter Tonnage Exhausted

Youngstown, O., Nov. 25.—First quarter sheets are impossible to find in this territory. Makers either are committed fully over that period so far as they can tell now, or, they are not inclined to take on additional tonnages on account of the impending fuel crisis. Some mills have a three weeks' supply of coal on hand while others are not so favorably fixed.

Light gage black and galvanized sheets continue in strong demand which has had a tendency to draw out fancy prices. So far as can be found, valley makers have declined to consider these. Dealers, however, have been turning considerable tonnage recently at attractive figures. A few hundred tons of No. 7 gage blue annealed in random lengths were taken by a Detroit automobile builder at a premium considerably over $10 per ton. Some buyers have stipulated the price they are willing to pay for certain grades of sheets and have requested brokers to locate stocks accordingly.

Considerable first quarter tonnage has been closed on March 21 prices, as far as can be learned. Consequently, the quotations of 3.55c for blue annealed, 4.35c for black and 5.70c for galvanized, still holds. But in the case of spot tonnages of various grades in dealer's or broker's hands, prices are practically anything that the buyer is willing to pay.

Want Manganese Ore

Philadelphia, Nov. 25.—More interest is shown in manganese ore by domestic buyers. Consumers have expressed willingness in some cases to pay close to 60 cents per unit at tidewater.

Eastern Plates Higher

Tonnage Sold at 2.75c to 2.85c Mill—Demand Heavy From Various Sources—Oil Field and Ship Work Supplies Big Tonnages

Philadelphia, Nov. 25.—Considerable plate tonnage was sold the past week at 2.75c and 2.85c eastern mill. One lot of 1100 tons for February delivery was booked at 2.90c mill. One eastern maker on some tonnage quoted 3.00c mill. The premiums are due largely to the desire of eastern makers to discourage buying. The demand coming from all classes of domestic sources. Much ship tonnage has been placed but details not announced. There is a big demand from Japan active inquiries totalling more than 10,000 tons which the mills are not taking due to their desire to work off some of tonnage on books for that country. Many inquiries are coming from England, France and Italy and easily 10,000 tons would be placed immediately except for the exchange situation which prevents the establishing of credits. Eastern mills have made some first quarter contracts at 2.75c Pittsburgh where they could not avoid taking them.

Demand is Less Urgent

Pittsburgh, Nov. 25.—Demands on makers of plates in this district are not so heavy and urgent as they were during the first few weeks of the steel plant strike, and some capacity is open for tonnages between now and the end of the year. Consumers not ordinarily served from this district now are able to secure supplies from regular sources. Heavy sheared plates are offered in fair quantities and those used in building cars are said to be easily placed, while there are intimations that all makers are not firmly adhering to the base price of 2.65c, Pittsburgh. Much tonnage is moving to fabricating interests, but car and ship builders still are rather sparing buyers. The latter have rather sizable stocks due to cancellation of orders and these supplies may later be felt as a market influence. Return of railroads to private management is expected to mean big car orders and a consequent demand for car plates.

Oil Business Boosts Demand

Chicago, Nov. 25.—Heavy demand for steel plates is coming out from various sources, with the major portion stimulated by the present activity in production and transportation of oil. The proportion of plates for these purposes is greater in Chicago than in the east and is furnishing mills with heavy tonnage. The leading producer has taken 14,000 tons, mostly plates, with some shapes and bars, and 4000 axles, for 1000 tank cars for the Union Tank line. The same interest has taken 3000 tons of plates for a Pacific coast shipyard to complete Emergency Fleet vessels on which work had been suspended earlier in the year. It also has booked 5000 tons of plates and other steel for car repair work. Much tonnage of plates is being required for the construction of oil tanks, but this comes through fabricators and is difficult to identify. The Standard Oil Co. is buying plates steadily in lots of 1000 tons or more. An inquiry has been put out by a Duluth shipbuilder for 10,000 tons, mostly plates, for second quarter and last half of 1920. Up to this time no producer has been found willing to quote for that remote delivery. The price remains firm at 2.92c, Chicago.

Tin Plate Business

For 1920 Taken by Independents at $7—Export Price, $7.50

Pittsburgh, Nov. 25.—Although the American Sheet & Tin Plate Co. opened its books for first quarter and first half of 1920 business in tin plate on Nov. 15, the independent manufacturers have made no formal opening and in view of the fact that only a few have any tonnage available for shipment over the first quarter, it is unlikely that they will do so. Such business as is being placed on the books is carrying a price of $7 per base box, Pittsburgh, for domestic accounts, but it is understood that some of the smaller makers have disposed of much of their output for first half, and on export business have secured a price of $7.50. It is doubtful if any of the independent companies today would consider a price of less than $7.50 for export business and some talk is heard of an $8 market. The present quotation of Welsh tin platemakers is around $10 a box in American money and while enjoying a better ocean freight rate than American makers, the latter are much better off in the matter of prices at which they can sell in foreign markets. Mill operations, including both the American Sheet & Tin Plate Co. and the independents, today are averaging close to 75 per cent of capacity but production is below this rate due to inexperience of a number of workmen. The possibility of a serious coal shortage may at no distant date curtail operations.

Offers $8 Per Box

Philadelphia, Nov. 25.—Scarcity of tin plate is causing exporters to bid big premiums. One exporter offered to pay $8.00 Pittsburgh without getting any material.

Vice Chancellor Stevenson has signed an order of removal which permits former Judge John Warren to bring the strike case between the American Type Founders Co. and its striking employes into the United States district court for final disposition. The International Association of Machinists is the defendant. The issue involves the picketing of the plant.

Alloy Market is Stronger

Liberal Sales Closed in Ferromanganese and Spiegeleisen—Possibility of Duty on Manganese Ore Becomes Factor

Philadelphia, Nov. 25.—After selling 5000 tons of ferromanganese for the first half of 1920 at $110, domestic producers yesterday advanced the price to $120. Business at this figure has not yet been done, and inquiry is now quiet. Sales during the past week included 2000 tons to a consumer in the Pittsburgh district. Following heavy business in spiegeleisen recently, one producer advanced his price to $45, furnace. Some spot spiegeleisen is still obtainable at $35.

Active Selling Features Market

New York, Nov. 24.—Active selling of spiegeleisen has been the feature of the ferroalloys market during the past week. Sales of 4000 tons are reported and it is likely that the business done was even larger than this total. The delivery involved, in most cases, is first half. This business was done on the basis of $35, furnace, for 18 to 22 per cent metal, 19 to 21 per cent being specified in some cases. There now is a disposition to ask higher prices for spiegeleisen. In fact, it is said that $36, furnace, is the lowest that could be obtained in some quarters. A number of spiegeleisen inquiries now are before the trade.

Inquiry for ferromanganese has taken an upward jump and current lots which are under negotiation involve 2500 to 3000 tons and probably more. The largest of these is a block which the Brier Hill Steel Co. wants for next year. In addition, there has been been some business done the past week involving several hundred tons, mainly for delivery next year. The business which now is being done is on the basis of $110, delivered, for 78 to 82 per cent metal. No English metal is being offered at this time. However, importers have received advices from their British principles, intimating that the former may be in a position this week to offer ferromanganese for 1920 delivery. In the meantime, the only price on English ferromanganese at present is $125, c.i.f. tidewater. This price is significant only because it indicates that the seller is willing to book business at this level as soon as the market advances to this figure. One consumer has offered to place a tonnage with an importer at $95, tidewater, but without interesting the latter. It is stated in the West, according to reports here, that offers of English metal at $100 tidewater, still are outstanding. A canvass of the market indicates that this price was quoted some months ago, and no longer is good.

Inquiries for at least 12,000 tons of ferrochrome, mostly high carbon, were in the market the past week for next year's delivery. The price of ferrochrome, 6 to 8 per cent carbon, remains about 27 to 29 cents, and alloy 4 to 6 per cent carbon, 28 to 30 cents.

The market for 50 per cent ferrosilicon is definitely stronger at $82 to $83, delivered, sales having been made previously at below $80. An inquiry for 300 tons, shipments to begin immediately, was reported.

The ferrotungsten situation shows little change. Foreign offerings continue to be made at less than $1 a pound, duty paid, while domestic makers are quoting $1.15 to $1.25 a pound contained and getting some business.

The price of ferrovanadium is somewhat stronger, but $5.50 per pound contained still can be done on very large lots, for high silicon alloy. Low silicon and otherwise high grade alloy commands $7 a pound contained and higher.

Demand Better, Prices Firmer

Pittsburgh, Nov. 25.—Better demand is noted in practically all kinds of ferroalloys with the possible exception of bessemer ferrosilicon and ferrotungsten. The latter material can be bought for $1 a pound and possibly less, although public quotations of several producers are much above these figures. Lack of activity in bessemer ferrosilicon occasions no weakness in prices for the reason that current production is almost nil, and most of the available supplies are owned by consumers. Competition from Canadian producers of 50 per cent ferrosilicon has practically vanished, and this fact is reflected in a firmer tendency in prices for the domestic material. While four or five carloads of this material recently were sold at $80, furnace, or slightly under $83, delivered Pittsburgh, few makers now would consider less than $85, furnace, freight allowed.

Lack of English competition enables domestic makers of 80 per cent ferromanganese to obtain full quotations on such business as is passing. It is doubtful if any of them now would shade $110, delivered, and with the English makers out of the market, for the time being at least, an advance is considered to be within the range of possibility. The Brier Hill Steel Co. is understood to have closed recently on 2000 tons of 18 to 22 per cent spiegeleisen and to have paid close to $35 furnace. One maker recently withdrew his quotation of $35 ,furnace, and now is quoting $45.

Good demand is noted for ferrochrome with material running low in carbon reported to be bringing up to 31 cents a pound. Ferrovanadium is selling direct to consumers at $5.50 a pound.

Higher Ferro Prices Are Asked

Cleveland, O., Nov. 25.—Domestic makers of ferromanganese are inclined to ask higher prices for forward delivery after having booked some tonnage for that position at the old figure of $110, furnace. One maker has quoted $120 flat and where many $110 quotations have been put out they are coupled with the provision that they are subject to a possible duty on manganese ore. Inquiries total 200 to 3000 tons are current from consumers in this territory.

Activity at Chicago

Chicago, Nov. 25.—Considerable activity in spiegeleisen and ferromanganese has developed. Demand for spiegel is especially good. The price has risen from $35 to $45, furnace, and while sales are not actually known at the maximum, some tonnages have moved at figures slightly under. Sales of ferromanganese involving several hundred tons each have been made for first half at $110, delivered, but sellers who made this figure have since withdrawn.

Contracts for fluor spar are now being made for next year, and the prevailing price is $25, Kentucky mine, for the gravel grade, which is somewhat under the price prevailing during the war.

Rails Reserved

By Pennsylvania With Various Mills —Much Tonnage Still Open

Philadelphia, Nov. 25.—The Pennsylvania railroad has made reservations for first half rails as follows: Carnegie Steel Co., 80,000 tons; Bethlehem Steel Co., 56,000; Cambria Steel Co., 30,000; Lackawanna Steel Co., 12,000, a total of 186,000 tons. The figures are subject to increase or decrease, the business being tentative.

Rail Contracts Near Signing

Chicago, Nov. 25.—Negotiations by western railroads for standard steel rails are going forward to the point where some contracts are practically closed, waiting only final signature by the purchasers. Additional tonnage has come into the negotiations until the total now being considered is practically 300,000 tons. It is understood present negotiations are subject to action of the government relative to turning the railroads back to their owners. Light rails are in active demand for domestic use, and orders approximating 5000 tons have been entered for export to Japan.

In addition to the 1000 tank cars recently bought by the Union Tank line from the Standard Steel Car Co. it is understood this interest has placed a total of 2500 tank cars.

Railroads Figuring Requirements

Pittsburgh, Nov. 25.—While demands for rails are confined entirely to small lots such as are required in repair work, these small orders together with export business provide manufacturers with a fair-sized backlog. It is understood that the railroads are figuring on their requirements and informally seeking information as to the ability of manufacturers to provide for them. Almost no carload business is being done in track bolts at present, but 5.00c, Pittsburgh, is about as low as any other makers now are quoting in quantities of 200 kegs or more. In less than carload lots the price ranges from 5.50c to 5.90c, Pittsburgh. Makers of standard spikes no longer have stocks on hand for only a few small spikes are available for early delivery, unless buyers are prepared to pay around 4.50c, Pittsburgh, as present obligations will probably absorb all production between now and the end of the year.

Spring Demand

Appears Early in Cast Pipe—Southern Prices Again Advanced

New York, Nov. 24.—Buying of cast iron pipe at this time for spring delivery is of significance in the eastern market. Usually consumers do not enter the market for their spring requirements much before the latter part of December. Their present activity is taken by sellers as an indication that they are endeavoring to place orders before prices advance. The market at present is tending strongly upward, and an increase in quotations is expected soon. Bids on the 1500 tons of 36-inch pipe for New York City were closed Nov. 25, the date was originally reported as Nov. 22. Little other public demand is in sight.

Makers Away Behind Orders

Pittsburgh, Nov. 25.—Although operations of pipe mills are much heavier now than at any time since Sept. 22, due to the gains at the valley plants and the fact that the steel strike in the Wheeling district has begun to crumble, production has not gained accordingly because all plants have a number of inexperienced men, and little headway has been made against contract obligations. Most producers are taking orders for oil country goods for 1920 delivery, but are naming no prices, the buyer taking his chances on deliveries and agreeing to pay the price prevailing at the time. A Pittsburgh producer of wrought iron pipe which a few weeks ago advanced prices on both lapweld and buttweld merchant pipe, has taken some business for future delivery at the advance. More or less talk is heard of an advance in steel merchant pipe, but it is probable that action in this direction will be delayed for some time or at least until the National Tube Co. takes a different stand relative to prices. La Belle Iron Works, Steubenville, O., has completed the clean-up and repairs necessary before making a start and this week got some departments in operation. A large number of men employed in the Riverside works of the National Tube Co., Benwood, W. Va., recently signed up to go back to work and an early resumption at the plant of the Wheeling Steel & Iron Co. also is likely. The National Tube Co. has its plants at Pittsburgh, McKeesport, Ellwood City, Pa., and Lorain, O., operating practically normal. The A. M. Byers Co. has its Pittsburgh and Gerard, O., plants running almost full, although somewhat hampered in the matter of production and shipments through green workmen. The Jones & Laughlin Steel Co. has its pipe mills running 100 per cent.

Seek Large Tonnages

Chicago, Nov. 25.—Though the season for buying cast iron pipe is well toward its close, some cities apparently desire to cover their requirements for work next season by getting their orders in early. Bids will be opened Dec. 1 at Elyria, O., on 5000 to 7000 tons and at Toledo, O., Nov. 25, on 3300 tons. Both these lettings involve the larger sizes. Norfolk, Nebr., has bought 145 tons and Witt, Ill., 615 tons, both of which will be furnished by the United States Cast Iron Pipe & Foundry Co.

Southern Makers Advance Price

Birmingham, Ala., Nov. 25.—Prices of cast iron pipe again advanced during the past week, this time $2 per ton. The 4-inch, class B pipe is now quoted at $58, and the 6-inch and over, $55. These quotations are for the 12-foot lengths, the 16-foot pipe being $1 additional. Both sizes of class A pipe are $2 above the B prices. There is a steady demand and the plants will operate on practically full turn through the winter. Sanitary pipe also is in strong demand.

Higher Prices for 1920

Pittsburgh, Nov. 25.—Makers of strip steel have opened their books for first-quarter business on a basis of 6.00c, Pittsburgh, for cold rolled, and 3.50c, Pittsburgh, for hot rolled. This is an advance of $7 per ton on the former and $4 in the latter. Very little tonnage is available. The one maker in this district is in danger of being obliged to curtail production because of the shortage of coal. General production of hot and cold-rolled strip steel still is far short of consumption, and prices are of secondary importance.

Prices of Castings Likely to Adance in East

New York, Nov. 24.—While prices of gray iron castings in this district have not yet been affected by the advance in pig iron and scrap and other foundry materials, eastern foundrymen say that increases are sure to come. The only change which has been noticed in the castings market in recent weeks is the elimination of the disposition on the part of certain foundrymen to shade the market. It is expected that prices in this district will show a tendency to advance at the end of the year.

Most foundries now have enough work on hand to keep them busy for two months, and some are booked considerably in excess of this period. Numerous buyers of castings report that they are having great difficulty in some cases in placing their work for any kind of quick shipment, and difficulty has been had in some cases in obtaining promises of reasonably deferred delivery.

Contract Let for New Follansbee Plant

Philadelphia, Nov. 25.—Follansbee Bros. Co. have let a contract to the Belmont Iron Works, Philadelphia, for the construction of a large new plant at Toronto, O. The project will require about 3000 tons of fabricated steel and the Belmont company will do all of the general contract work above the foundations. The plant at Toronto will comprise a 180 x 360-foot open-hearth building, a 100 x 300-foot bar mill, ingot and furnace building, a 140 x 880-foot hot mill, a 92 x 820-foot annealing building, a 60 x 300-foot scrap shed and a 75 x 500-foot wareroom.

Nail Shortage

Brings Out High Offers—General Wire Situation is Taut

Pittsburgh, Nov. 25.—Huge demands are pouring in on the makers of nails. Not only is the open weather assisting building operations, but the fruit growers of California and the tropics, now in the midst of their shipping season, are poorly supplied. The makers of roofing material who are obliged to provide the nails with every bundle that is shipped are offering as high as $10 a keg. While the general quotation on nails among independents in the Pittsburgh district is 3.50c, Pittsburgh, this is merely a nominal quotation and would not be considered on new bookings. Actually small sales have been made at $4 to $5 and the companies that are taking any advance business are doing so with the stipulation that the tonnage shall take the price which prevails at time of delivery. The situation in other wire products is only slightly less acute. While all makers are running, including the Cambria Steel Co., more success has been maintained in getting the steel production up than in restoring normal conditions in the finishing mills. Galvanized barbed wire, although nominally rated at from 4.20c to 4.35c, Pittsburgh, recently has sold at 5.00c or higher and more than 4.00c has been obtained for galvanized wire. A number of makers have rods for sale because of the slack finishing mill operations and sales to domestic consumers have been made anywhere from $57 to $63, while $75 is said to have been obtained on some export tonnages.

Production On the Increase

New York, Nov. 24.—The principal wiremakers report that they still are unable to give consumers all the material they want. There is a continued great scarcity of nails and the other manufactured wire products. However, the mills are able to give better deliveries now than a week ago. In order to make the material go as far as possible, they are limiting the customers to actual needs. It is estimated that the mills affected by the strike now have at work about two-thirds of the number of workers engaged at the time of the walkout. Production is not yet at the rate of two-thirds of capacity, indicating that the forces are not producing as efficiently as will be the case when the men, many of whom are new, become accustomed to the work.

Nails Sell at 4.50c

Philadelphia, Nov. 25.—Due to scarcity of nails consumers are offering big premiums to tempt sellers. One lot of nails for spot delivery was sold at 4.50c Pittsburgh.

Demand is Strong in South

Birmingham, Ala., Nov. 25.—Southern manufacturers of wire and wire products cannot fill all the orders now in hand and those being offered. The Gulf States Steel Co.'s plant is now producing 100 tons of nails a day and shipping them almost as rapidly as produced, besides taking stock from warehouses. Stocks are being reduced in this effort to supply the most urgent needs.

Export Inquiries Are Excessive

Only Ten Per Cent of Requests For Steel Are Being Turned Into Orders—Japanese Wants Are Larger Than Usual—Impossible to Book Some Products For Delivery During the First Half of 1920

NEW YORK, Nov. 24.—November export sales probably will exceed those made during October but the volume is still below that of last summer. One important steel exporter declares his sales this month have been probably 30 per cent less than during last August. Another exporter says the market is filled with foreign inquiries but that it is practically impossible to place any orders on account of the lack of material. It was estimated that probably not more than 10 per cent of the current inquiries are being turned into orders. The large producers still hold to their preferential list of dealers. Most independent export houses have sold out their stocks in warehouses and have found it almost impossible to replace them. The large dealers will consent to accept orders up to 500 tons, and it is said that it is still possible to obtain plates.

The larger exporting interests, it is reported, are not yet willing to open their books freely to new business because they are anxious to keep down the price. The past week, however, saw a gradual improvement in the situation, as a greater volume of sales were booked, and although most of this is for early delivery some business has been signed up for 1920. The tendency toward higher prices is recognized on all sides. Even billets, which during the summer, were selling cheaper in the export market than in the domestic are now advancing close to the domestic price.

Four-inch billets were sold down to $40, f.a.s. New York, during the past summer. One of the latest sales reported was made at $44 f.a.s. New York. A recent inquiry for 2000 tons of billets brought forth a quotation of $43.50, Pittsburgh. England has been a consistent purchaser of billets but the increased export price coupled with the disparity in the exchange is gradually checking these sales. England has been buying bars and hoops, however. A British inquiry for 50,000 tons of plates met with discouragement in this market because it was felt that it would be impossible to place the order at a satisfactory price.

The United States Steel Products Co. is accepting limited orders for barbed wire for South America and orders for wire rope for the Orient. It has been found that England is competing in many of the markets on galvanized sheets, due to the fact that the English ton contains more sheets than the American ton. The effect of this competition is now being felt in South America.

Base Prices Advanced

In many cases it is no longer a question of paying premiums for the goods booked but the export houses declare the base prices have gone up. For instance wire is now costing from $4.39 to $5 f.a.s. New York. Nails cost from $3.55 to $5 f.a.s., and light rails including accessories sell from $57 to $60 f.a.s. New York. The higher prices and the scarcity of material have enabled the warehouses and the railroads to clean up the congestion which existed at the various ports the first of November.

European business is fairly well blocked although some few sales are reported from time to time. There have been no recent sales to France, although the French are in the market with inquiries for rails and cars. Italy has been making inquiries for nails and sheets and Spain also wants nails. Finland has been inquiring for rails and cars. One of the largest European inquiries was for 10,000 tons of pig iron from Italy. Rumania has been buying sheets and bars. The Rumanian orders filled have averaged 200 tons each.

The Dutch East Indies are back in the market, purchasing sheets, hoops and wire. These orders, generally, are placed through Holland. One of the orders recently placed called for 3000 tons of 26-gage galvanized sheets. A sale of 500 tons of hoops was reported last week to India. The Indian specifications are rather elaborate and at times confusing.

Holland has been purchasing shipbuilding material. Among the sales noted last week were 75 tons of bulb angles and 250 tons of plates. These sales were made by a new export house. Despite the disparity in the exchange it is said that American producers have been demanding 70 per cent of the purchase price of goods sold to Belgium. This has mitigated against sales there inasmuch as Swiss firms are extending credits and doing all they can to facilitate shipments on the Rhine from Basel to Antwerp. French duties on iron and steel have been nearly doubled by the tariff which became effective in July. Values having risen greatly, the former specific duties are multiplied by various coefficients from 1.1 to 3. Tool steel, which paid 15 francs before the war, is now paying 40½ francs per 100 kilos.

South American business has been holding up fairly well. It continues to consist chiefly of wire and similar products which the leading American interests are consenting to book. Among the orders booked were 23,200 reels of barbed wire for Cuba and South America. South America is also inquiring for bed-stead tubing, and has just placed an order for 200,000 feet of English standard pipe. Brazil has purchased 20,000 coils of barbed wire, and Argentine 275 tons of the same material. A small export house reported the sale of 500 tons of barbed wire to South America, and another sold 1000 reels of barbed wire.

Belgium is beginning to sell some products in South America and in these lines it is reported that Belgian prices are approximately 25 per cent below the American prices. An order from Cuba was booked in the United States for 200 tons of 60-pound rails, and it was said that 1500 tons more will be needed within the next two months. The bulk of the export business is being done with the Orient. The Japanese have sent in some tremendous inquiries and the Chinese are flooding the market with small inquiries for miscellaneous material. The Chinese appear to be especially anxious to obtain wire for bailing and similar purposes. The Japanese inquiries are today the feature of the market, however. The Japanese are asking for 100,000 boxes of tin plate, 20,000 tons of sheets and 17,000 kegs of nails, to mention only the most prominent inquiries.

Japan has been buying wire shorts. Among other sales to that country were 500 tons of sheets, 2500 tons of 60-pound rails and 3000 tons of 12-pound rails. Japan has placed a number of orders for hoops. One house reported the sale of 150 tons of hoops, 1500 cases of tin plate and a fair tonnage of galvanized wire. Another house reported the sale of 800 tons of sheets for prompt delivery, and 300 tons of sheets, 1200 tons of tin plate and a small

quantity of structurals for first quarter. This house is now trying to place a Japanese order for 50 miles of 12-pound rails and 3000 tons of billets. A sale of 2000 tons of wire rods was noted last week. Two Japanese inquiries, one for 7000 kegs and another for 4000 kegs of wire nails, have been shunted about the market and it now appears that they will be filled by a Canadian mill. An order for 3000 kegs, however, was taken here. One cable brought a Japanese order to a prominent exporter for more than $1,000,000 worth of goods, aggregating some 5000 tons of material, including light rails, sheets, plates, bars, pipe, wire and nails. An Oriental sale of 3000 cases of tin plate was reported last week. One house reported the sale of 400 tons of galvanized wire, 2000 kegs of nails, 3000 boxes of tin plate and 260 tons of tank plate to China.

Fuel Uncertainty

Delays Increase in Mill Operations, Although Men Are Available

Youngstown, O., Nov. 25.—Officials of Mahoning valley steel companies delayed placing additional equipment in operation this week on account of the impending fuel crisis. All plants, however, are running as near to capacity as possible. When the situation shows some signs of clearing up, officials plan to operate their mills at the maximum. Enough orders are on hand, and plenty of workmen are in the plants to warrant such action.

Old employes of the various steel plants here are applying for their former positions despite the recent assertion of S. T. Hammersmark, secretary of the American Federation of Labor in this territory, to the effect that the laborer's chance of victory never was brighter. Several hundred former employes of the Republic Iron & Steel Co. held a meeting Saturday and voted to return to work.

Few strike pickets were seen at mill gates Monday, the usual number of men changing turns without being molested. As an outcome of the large number of assaults on workmen who returned to work, the mayor has issued orders forbidding the holding of public meetings. John E. McCadden, secretary-treasurer of the Youngstown district for the national committee conducting the steel strike, has been arrested on a charge of violating the new law against syndicalism and is awaiting trial following his release on bond in the sum of $3000.

Forty-two out of 63 open-hearth furnaces in the Mahoning valley are in operation this week as compared with 41 last week, the additional unit having been placed in action at the plant of the Youngstown Sheet & Tube Co. Fifteen out of 25 blast furnaces also are blowing. Every plate mill in this district, with the exception of that of the Sharon Steel Hoop Co., is under power. Nine sheet mills, however, are rolling at this plant, which is two more than reported last week. All three bessemer plants here are active.

Plan Americanization

Chicago, Nov. 24.—Representative of every racial group of workers in Gary, Ind., numbering about 1800 people, met Sunday in the auditorium of the Froebel school and appointed committees to organize each group for Americanization purposes. This is the result of revelations during the steel strike when the menace of unassimilated foreigners was made plain.

Plants Conserving Coal

Cleveland, Nov. 25.—Although the steel strike in this district is to all intents and purposes at an end, operations are curtailed to some extent by a threatened shortage of coal. Most plants have stocks on hand but are conserving them. Because of this condition operations in the district are only at 85 per cent of capacity.

Metallurgical Medal is Awarded Schneider

Charles Eugene Schneider, head of the Creusot Steel Works and chairman of the French economic mission to the United States, was awarded the gold medal of the Mining and Metallurgical Society of America at a dinner in New York, Nov. 25, preliminary to his departure for France. It was the sixth annual award of the medal which is given for research work in metallurgy. Charles M. Schwab presided at the dinner, and among the speakers was Dr. Henry M. Howe, professor emeritus of metallurgy at Columbia university, who told of the importance of the work done by Mr. Schneider during the war. Earlier in the day Stevens Institute of Technology conferred the degree of doctor of engineering on Mr. Schneider.

The Dickey Steel Co., Inc., New York, has been appointed eastern sales and export representative of the Hammond Steel Co., Syracuse, N. Y.

Ordnance Plant

At South Charlestown Made Good Progress, Earle Reports

Washington, Nov. 25.—The first year's developments at the naval ordnance plant, as yet uncompleted, at South Charleston, W. Va., is told by Rear Admiral Ralph Earle, chief of the navy's ordnance bureau in his annual report just issued. War pressure forced speedy operation of the forging and hot-metal departments of the projectile plant, both being in use before the signing of the armistice, with the result that in the fiscal year ending June 30, 1919, the hot metal department produced 5217 gross tons of steel ingots, 228 gross tons of steel castings, while the forging shop turned out approximately 2000 gross tons of forgings.

The projectile plant buildings were completed at the beginning of the fiscal year, Admiral Earle said, and the installation of machine tools was practically completed a year ago. Three electric furnaces, each of six tons capacity, were put in operation in the third quarter of 1918, the department being on a operating basis in September, 1918. In the forging shop a 500-ton press was started on Oct. 2 and a 3000-ton press on Oct. 15, 1915. The heat-treatment department was able to meet the outputs of these departments in August. This completed portion of the plant, with an annual capactiy of 10,000 tons, was ready two months before the signing of the armistice.

Considerable progress has been made in the construction of the main plant. The pouring of foundations for the open hearth, forge and furnace, machine, and heat-treatment buildings was commenced last January and by the first of June this year the erection of the structural steel had commenced.

Admiral Earle's report states $30,000,000 worth of machinery furnished cost-plus ordnance manufacturers, located in 23 plants, has been disposed of by the bureau of ordnance. With the exception of 200 special gun boring and turning lathes sent to ammunition depots for storage, all of this equipment has been allocated to the various naval establishments.

To Corrugate Sheets

Complete ridge rolls and machinery for forming V-crimp and for corrugating zinc sheets have been installed at the plant of the American Zinc Products Co., Greencastle, Ind. With the operation of this equipment, the company engages in a new line of production as formerly its output was confined to zinc slabs and flat sheets.

Fuel Scarcity

Hurts Steel Plants More Than Steel Strike

Pittsburgh, Nov. 25.—Scarcity of fuel, due to the failure of the striking coal miners to observe the spirit as well as the letter of the mandate of the federal court at Indianapolis of Nov. 11, carriers with it a menace more threatening for the steel plants of the country than the strike of the steel plant workmen at its worst stage. That a number of them will be obliged to suspend for want of fuel is a foregone conclusion unless relief is forthcoming immediately in the shape of liberal shipments. Negotiations for a conclusion of the miners' strike still drag on at Washington and even if the trouble was settled by tomorrow, doubt is expressed that enough coal could be provided to help out the situation at the steel plants.

It will be recalled that when the strike was called the average coal stocks at the steel plants of the country were sufficient for about a month's normal consumption. More than four weeks have elapsed since the union miners went out and it is doubtful if the steel plant supplies today are sufficient on the average for another week. In the Pittsburgh district proper, the situation is not as bad as it is in other districts for here the plants are able to draw to some extent upon nonunion fields Plants in the valley district will suffer and in Gary, Ind., the shortage of fuel already is beginning to be felt. In the Wheeling district, it is a shortage of fuel more than a lack of desire on the part of the men to go back to work that is delaying a resumption of steel plant activities.

The steel plant strike is largely a thing of the past. Except for a slight shortage of common labor, Pittsburgh plants are running normally and at one plant here the results in steel production are more pleasing than they were with a full complement of men just before the strike started. The strike rapidly is crumbling in the Wheeling-Steubenville district and in Johnstown, Pa., the Cambria Steel Co., which a fortnight ago was down tight, now is running about 50 per cent. Official calling off of the strike is yet to come and may not materialize.

Actually, the strike is being maintained by the organizers and secretaries, who draw fat salaries during the period of the strike, and naturally will insist because of that fact that the strike exists so long as they have a handful of men to talk to. Privately, however, the leaders are admitting that the strike has been lost and also that the task of organizing the steel plant workmen was too big a task, especially for those who had charge of it. The national committee held a meeting here yesterday, but had no announcement to make at its conclusion other than that a committee had been appointed to investigate into the employment of negroes in the Youngstown, O. plants, and of another to lay the matter before Governor Cox of Ohio.

Shops Are Inadequate

Washington, Nov. 25.—Maj. Gen. C. C. Williams, chief of ordnance, war department, states in his annual report that ordnance shops and depots of the department are adequate to meet any demands. The industrial agencies of the department now include 14 manufacturing arsenals, all equipped to 100 per cent capacity and with sufficient reserves of dies and tools to outfit a score of additional plants.

The report states that the summit of achievement of American mechanical genius during the war was the successful production in quantity of French recuperators, the device which controlled the recoil of all cannon and brought the piece back into position for refiring. Germany's experts never succeeded in making this device, and even its originators, the French, continued to turn it out one by one.

Scotch Molders Fail to Join British Strike

(By Special Cable)

London, Nov. 25.—Molders in Scotland have decided not to join the British foundry strike. The strike in England is in its tenth week and the shortage of castings is serious, plants closing. One hundred thousand workers are involved in England. They are demanding an advance of 15 shillings a week. There is a possibility of an early settlement.

British coal output is steadily increasing. Production in the week of Nov. 8 was the highest yet. It amounted to 4,800,000 tons.

Conditions Are Favorable

Boston, Nov. 25.—In spite of strikes, local difficulties, and a market uncertainty, industrial conditions throughout New England are favorable. Probably no other section of the country is at present as well supplied with bituminous coal. A recent report by the New England coal commissioner of the railroad administration announces that the fuel situation here is now well in hand. This is in the face of a silent coal strike which is already cutting down railroad service and curtailing manufacturing in some other parts of the country. Good supplies of coal have been arriving recently by water from the New River and Pocohontas fields.

The Nonferrous Metals

	‡Copper	Future Straits N. Y.*	†Lead, New York basis	Zinc St. Louis basis	Aluminum	Spot antimony	Nickel ingot

*Future shipment from Singapore.
† American Smelting & Refining Co.'s price.
‡Open market.

NEW YORK, Nov. 25.—Renewed possibility of intervention in Mexico precipitated another war cloud in the metal markets the past week. Accompanying this development have been higher rates of Sterling and other foreign exchanges, together with shap advances in the English metal markets. General opinion in the markets is that serious trouble would further stiffen exchange rates against the United States enabling increased export business in metals, thereby affecting the domestic markets. Intervention also might affect the Mexican silver output and thereby further influence the world monetary situation. Lead, coper and other metals are produced in large quantities in Mexico.

The copper market declined further the past week, nnder slack demand. Producers competed with outsiders in a wide open market and electrolytic copper prices dropped to 18.87½c and 19.00c Tuesday. Casting went to 18.25c and lake to 19.25c and 19.50c. One factor in copper was the less favorable export outlook, caused by the failure of the senate to ratify the peace treaty, thereby deferring the time when suitable financial arrangements could be made.

Tin prices advanced about 1½c to 2½c a pound the past week. Business was done a week ago in Straits tin for future shipment as low as 52.75c, New York, but the big advance in tin prices at London, plus the strengthening of exchange increased the cost of importation to 55.00c Tuesday. Banca tin prices are about a quarter cent below Straits. for all positions and 99 per cent tin about half a cent below Straits tin. Spot Straits tin advanced to 54.50c, exstore.

The prime western zinc market, after dropping from 8.00c to 7.75c, East St. Louis, recovered during the week to about 7.90c for shipment this year, 8.00c for shipment first quarter. Dealers showed active interest in the market and there was an increased galvanized inquiry. Less export interest was manifested.

The lead market remained strong, with outside interests asking 6.90c, New York, 6.70c to 6.75c, East St. Louis, as against the leading producers' quotation of 6.75c, New York, 6.50c, East St. Louis.

The antimony market is strong at 9.25c, duty paid, New York, for both prompt and futures.

The price of ingot nickel was advanced during the week to 42c, New York.

Aluminum is steady.

Welsh Steel Plant Self-Contained

Raw Materials Are Controlled by Company, Which Makes Diversified Line of Products—New Blast Furnaces Now Under Construction Will Give Company Annual Iron Output of 450,000 Tons

BY JOSEPH HORTON
British Correspondent of The Iron Trade Review

IT IS rare that coking coal, iron ore, limestone and dolomite are found in close proximity to a site suitable for an extensive blast-furnace and steelworks plant. In Lorraine, ore and coal are mined near the center of the steel industry, but the coal has poor coking properties. In the United States, except in the south, ore is in most cases carried hundreds of miles to the furnaces. In the Sheffield district of England, the furnaces and mills are built within city limits and receive iron and fuel from railroad cars.

South Wales, however, is rich in the essential materials for steelmaking. In the hills and valleys of Monmouthshire, rich mineral deposits are found close to the surface, and here the Ebbw Vale Steel, Iron & Coal Co. has developed mining, smelting and manufacturing properties which in the aggregate constitute one of the most complete steelmaking establishments in the United Kingdom.

The original iron works were acquired from the Earl of Pembroke in 1674; they came into the possession of Messrs. Harford, the Ebbw Vale partners, in 1780, and since then the fortunes made by the iron kings of Wales have reached fabulous amounts. In the middle of the nineteenth century the Ebbw Vale Co., whose operations were on a small scale compared with those of the present time, realized large profits for many years. Originally, the works were established for the production of iron, but at that time the vast mineral wealth of the district was not known. The coal was worked in drifts where it cropped out at the escarpments of the hills, a very cheap form of mineral extraction. It is stated that in the early days coal and iron ore could be placed at the furnace top for about $0.36 per ton. Wages were low, the furnace keepers' wages ranging from $2.88 to $3.60 per week.

The Ebbw Vale company is credited with having turned out the first iron rail ever made in South Wales. That was in 1830, and at the company's offices a rail made for the Stockton & Darlington railroad more than 80 years ago may be seen. It is claimed that the Ebbw Vale plant is the only self-contained iron and steel works in Great Britain, since the company possesses its coal and native iron ore mines and native limestone and dolomite quarries. It owns 3300 acres of freehold land and, with its subsidiary companies, has in addition 11,000 acres of leasehold property. When its present blast-furnace plant, which includes nine stacks, are completed, the company will be in a position to produce 450,000 tons of pig iron per year. Last year the company produced 2,800,000 tons of coal; employed over 20,000 men; paid $18,195,843 in wages and over $729,975 in imperial taxation. A 15 per cent dividend recently was declared.

The most important extension consists of two new blast furnaces which will cost about $4,866,650 and increase the prewar output approximately 50 per cent. During the war the labor difficulty was largely overcome by

FIG. 1—NOS. 1, 2 AND 3 BLAST FURNACES AT THE VICTORIA PLANT OF THE EBBW VALE STEEL, IRON & COAL CO., MONMOUTHSHIRE, SOUTH WALES. THE HOT METAL IS CAST IN OPEN PIG BEDS

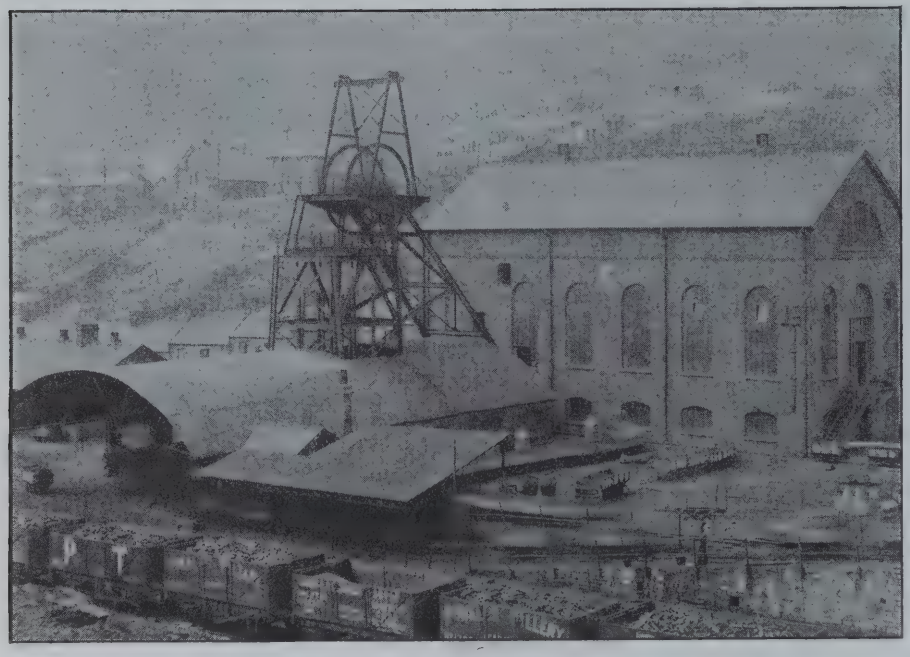

FIG. 2—HOISTING EQUIPMENT AT THE PRINCE OF WALES COLLIERY, EBBW VALE

employing about 3000 girls. Provision also was made for dependents, and approximately $827,305 was spent for this purpose. In addition to the Welsh lands there are about 1400 acres of ore mines at Irthlingborough, Northamptonshire, proved to contain a bed of ore at a depth of 80 feet below the surface which averages 9 feet in thickness. When calcined it yields a product averaging 46 to 48 per cent of metallic iron. The acquisition of this iron-ore mine has rendered the company independent of foreign ore which formerly was obtained from the north and south of Spain and from Algeria. The Northampton bed is computed to contain about 50,000,000 tons and is sufficient to serve all requirements for a considerable number of years. The ore production at this mine normally is about 2000 tons per 24 hours, and this would be maintained but for the unfortunate shortage of ore cars, from which all British trades are suffering at the present time. The necessary limestone is obtained from the company's quarries situated within 5 miles of the works on the crown of the neighboring range of hills. There is an area of at least 150 acres of limestone the depth of the stone being about 450 feet, and the supply of material of first class quality is practically inexhaustible.

Controls Extensive Coal Mines

The plant is surrounded by coal mines. The company can mine 6,000,000 tons per year when working at maximum production. Among the coal properties are the Prince of Wales pit, in the center of Ebbw Vale; the Waunllwydd, which is near by; the Marina, which is 2 miles south of the works; the Graig-Fawr and the Red Ash pits; the Abercarn pit, the name of which is unhappily familiar throughout Wales as the scene of a terrible explosion in 1878 when 280 persons lost their lives; and the Cwm Carn colliery, which is electrically equipped throughout. Associated with the company under the same directorate is the group of pits owned by the Powells Tillery Co., in the Abertillery district; and also the Taly-Wayn pit and various pits owned by Messrs. John Lancaster & Co., which were acquired within the past few years. A new pit is being sunk at Aberbeeg. To meet the dolomite requirements of steel manufacture a quarry at Risca, containing valuable quantities of first class dolomite rock, has been purchased.

An ample water supply is obtained from 2000 acres of gathering grounds north of the works. A reservoir, which will increase the storage capacity to 250,000,000 gallons, is at present in course of construction. The water is suitable for the boilers, and there is an arrangement with the local authorities by which the company's supplies can be drawn upon for public use when required.

One Stack Used as a Spare

At the blast-furnace plant four stacks are in operation, the oldest of these being 60 feet high with a 17-foot bosh and a 9-foot hearth. The practice followed is to operate three of the stacks while the fourth is being repaired. The total production is 2400 tons per week. The blowing engine is a beam-type unit and is one of the largest of its kind ever built in Great Britain, the blowing cylinders being 12 feet in diameter with a piston stroke of 12 feet. In spite of its age the blower continues to give good service. A more modern plant is situated at Victoria, about a mile down the valley. The plant includes two furnaces, 60 feet high, with 18-foot boshes and 10½-foot hearths, each furnace having a weekly output of 1100 tons. The third furnace which was built in 1902 is 75 feet high and is equipped with an 18½-foot bosh and an 11-foot hearth.

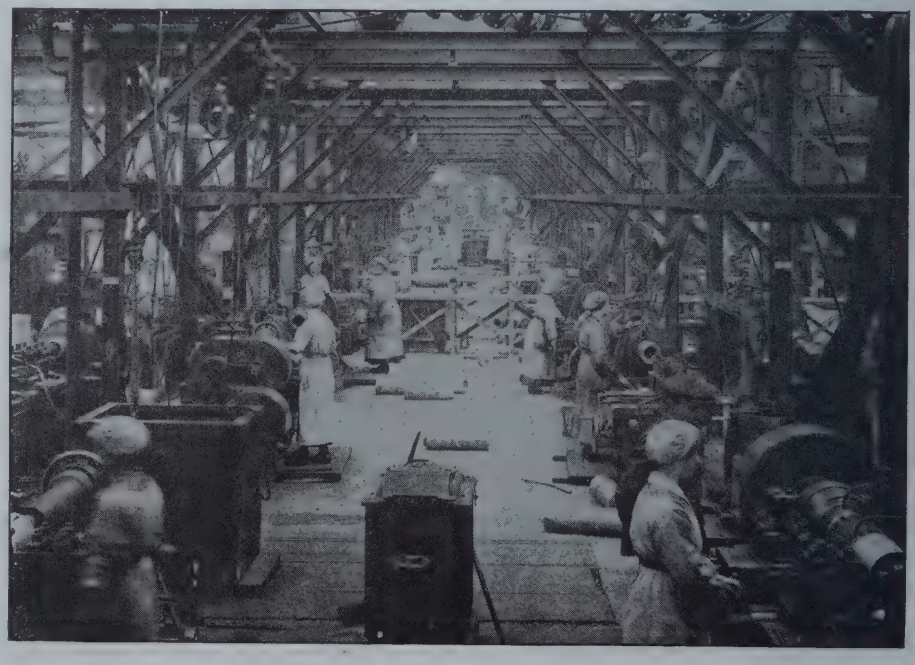

FIG. 3—INTERIOR OF THE PROJECTILE DEPARTMENT WHICH, IN 1918, PRODUCED 1000 SHELLS PER WEEK

This furnace is blown with 10 tuyeres and the blowing equipment is modern throughout. The furnace is served by a row of large bins for storing the raw material. The stock is transferred through an underground tunnel to the skips which charge it into the top of the furnace. The hoisting apparatus was built by the Brown Hoisting Machinery Co., Cleveland. The capacity of this furnace is 2200 tons per week. The gas from the furnace is passed through a Halberg-Beth type cleaning plant, prior to its delivery to the stoves and boilers.

The blowing equipment includes two compound, quarter-crank engines of American type, one built by Richardson, Westgarth & Co., Ltd., Hartlepool, Eng., and the other by Galloway, Ltd., Manchester, Eng. They are capable of blowing 20 pounds pressure per square inch. A third engine is of the Kitson type and in addition there is a Parsons-type, parallel-blow, turbo-blower. The latter two engines deliver the air at 10 pounds per square inch pressure.

FIG. 5—BESSEMER DEPARTMENT INCLUDES FOUR 25-TON CONVERTERS, AND ONE 750-TON AND ONE 250-TON MIXER

Collieries Will Be Electrified

The furnace gases are led to a power station where they are used for generating electricity. Part of the current is used at the steel plant, and part at the Ebbw Vale group of collieries. Arrangements for electrifying all of the collieries connected with the company's property and connecting the system throughout by means of ring mains now are being made. The generating equipment includes two 5000-kilowatt and two 2000-kilowatt turbo-generators which supply alternating current at 2200 volts; and a 1500-kilowatt generator which supplies direct current for lighting, crane operation, and various subsidiary requirements throughout the works. These generators, however, are being displaced by rotary converters which will use current from the more economical source. The boilers are fired chiefly with blast-furnace and coke-oven gas. An auxiliary installation, however, includes coal-fired boilers.

The current used for public lighting in the district is provided by this installation, the local urban council buying light from the company. Electricity is available for street lighting, general household and domestic purposes.

The coke plant before the war included 100 by-product ovens of the type designed by the Koppers' Coke Oven & By-product Co., Sheffield, Eng., but 50 additional ovens lately have been added and now are being placed in operation. Another battery of 100 ovens on a second site is in course of construction. All these ovens are built conveniently near the blast furnaces. Still another battery of 100 ovens is built near the Maune pitts. The company recently dismantled 150 ovens of the same type, which originally occupied the site of the latest erection. The ovens are served by washeries at Ebbow Vale, Marine and Abertillery. The company's entire output of small coal is coked, the total production now being from 8000 to 9000 tons per week.

The by-product plant is of the latest type adapted to the recovery of ammonium sulphate, tar and benzol. During the war large quantities of toluol were obtained from this plant. Connected with the by-product plant is a department for the manufacture of sulphuric acid. The surplus gas from the new ovens is led to the boilers adjoining the generating station, where it serves to augment the main gas supply.

FIG. 4—PART OF THE GENERATING EQUIPMENT AT THE VICTORIA PLANT

Steel Mill Equipment

The bulk of the pig iron produced at the furnaces is conveyed in ladles of 30 tons capacity to the steel plant which is midway between the two groups of furnaces. The bessemer

works include one 750-ton and one 250-ton mixer, both of which are heated by means of producer gas; and four converters each of 25 tons capacity. The department is served by two 50-ton overhead cranes. The casting pits are arranged on either side of the casting crane track which is parallel to the general line of the shop building. Approximately 100 tons of steel are poured in 24 hours. The ingots are removed from their molds by an electrically-driven overhead stripper built by Wellman, Seaver & Head, Ltd., now known as Wellman, Smith, Owen Engineering Corp., London, and are charged into soaking pits below the level of the mill floor by means of two 5-ton overhead cranes. As a rule, the ingots weigh 2½ tons.

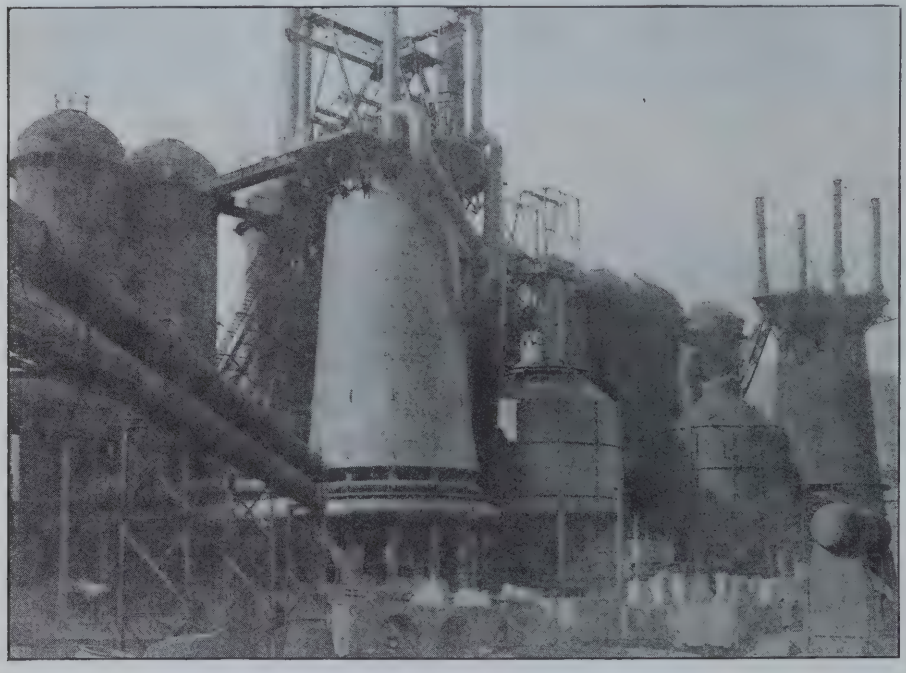

FIG. 6—NOS. 4 AND 5 STACKS AT THE VICTORIA PLANT ARE NOW IN THE COURSE OF CONSTRUCTION. THE FURNACE LINES CONFORM CLOSELY TO AMERICAN PRACTICE

The blooming department which is built parallel to the steelmaking plant includes a 40-inch, two-high reversing mill. A 36-inch roughing train, and a 30-inch finishing train of the two-high type, rolls the steel into rails, 4 and 2-inch billets, and sheet and tin bars ranging in width up to 12 inches.

Utilizes Steam Drive

The mills are steam driven and are well situated for loading purposes, the cooling beds being built on a level with the railway cars. The numerous railway lines intersecting the company's property embraces a mileage larger than some British railways. About 30 locomotives are necessary for intermill switching. Direct plant communication with the main railway lines, which lead to Newport and elsewhere, are to be had. The works are situated at a height of about 1000 feet above sea level, 21 miles by rail from Newport, the well-known Monmouthshire seaport. This facilitates the coasting of cars from the works to the sea, a matter of great importance, where large tonnages, a fair proportion of which is for export, have to be handled. Foreign ores, brought by sea, are unloaded at the company's wharves situated at the mouth of the River Usk at Newport. They are conveyed from there in the company's drop-bottom hopper cars to the blast furnaces and are dumped directly into the bins at a height of approximately 50 feet above the furnace yard.

A ropeway haulage system is used for conveying coal to the storage bunkers, a distance of three-quarters of a mile from a point close to the railway company's system. Another ropeway recently has been utilized for delivering ore to the furnace bins.

The steam required for plant operation is obtained from a battery of Lancashire coal-fired boilers, as well as from boilers served with waste gases from the soaking pits. These boilers, however, now are being displaced by modern water-tube boilers which are fired mechanically with coal from a system of storage bins. All cranes and part of the auxiliary equipment in the steel works are electrically operated. A large part of the sheet-bar production is utilized in a neighboring sheet-mill plant which rolls approximately 5000 tons of sheets per week.

Four Siemens-Martin type open-hearth furnaces of 25 tons capacity utilize the large quantity of scrap produced in the works. The steel from these furnaces is rolled on a two-high, reversing, 28-inch roughing and finishing mill into spring steel, plates, light-colliery rails, tube steel, rounds, and miscellaneous sections. Production usually averages from 800 to 1000 tons per week. When necessary this mill can be served from the blooming mill previously mentioned.

Sheet Mill Practice

South of the main steelworks and near the blooming mill department is a modern sheet-mill plant which was completed in 1913. The plant has a weekly output of 500 to 600 tons of light sheets. While rolling heavy gages during the war, production averaged 1000 tons a week. Sheets up to 60 inches wide of varying lengths can be rolled. The main trains consist of two sets of three hot rolls and one set of cold rolls, placed on each side of the center drive. The mill is operated by a 1000-horsepower, electric motor made by the British Westinghouse Co., Ltd. The motor operates at 185 revolutions per minute and by means of reduction gears, drives the mills at 30 revolutions per minute. The motor flywheel with its shaft weighs 180 tons. The drive is equipped with an automatic slip regulator which permits the motor to slow down under the impact of heavy peak loads, the load being taken by the flywheel. The shears are built to cut sheets in lengths up to 12 feet. After leaving the rolls the sheets are passed into a continuous-type annealing furnace. The plant is equipped with galvanizing and corrugating units, the product of which was in large demand prior to the war. The Great Western railway runs alongside the dispatching warehouse.

The production of springs for railway cars and locomotives has been an important item. At Pont-Newydd near Newport there is a small plant for manufacturing weldless tubes by the Mannesmann process.

The company has specialized on the production of ingot molds which have constituted a large proportion of the 500 tons of the weekly foundry output. Castings up to 40 tons and ingot molds up to 18 tons are made. The cranes used in the foundry are electrically operated. During the war a special shop was equipped for the production of 18-pound shells and this was followed by the manufacture of 60-pound, high-explosive shells and 8-inch shells, the total production of the latter being 1000 shells per week. This work was discontinued after the signing of the armistice.

As showing the varied character of the company's productions mention may be made of the two large works for making firebricks and ordinary building

bricks. The raw material comes from the used linings of blast furnaces and from clay rejected from the old iron ore workings operated many years ago. In Sirhowy at the head of the adjoining valley the company also operates a brickworks which utilizes the bricks from a blast furnace dismantled 20 years ago.

The new blast furnaces now being erected at Victoria embody the latest design. They are 85 feet high with boshes 22½ feet and hearths 14 feet in diameter. The charging apparatus is the product of the Brown Hoisting Machinery Co., Cleveland. Each furnace is equipped with five 90-foot stoves. The blowing equipment includes three turboblowers each capable of delivering 40,000 cubic feet of free air per minute at 25 pounds pressure. The gas-cleaning plant is being enlarged to deal with the gas from these furnaces, and additional generating equipment is being installed in order to utilize the surplus gases. These furnaces will be among the largest in the United Kingdom. The dust catchers are 36 feet in diameter. The storage-bin system which is in line with the existing plant is being extended to serve the new furnaces. It is believed each of these furnaces will have an ore smelting capacity of 2500 tons per week, a large increase over present conditions.

An important auxiliary of the furnaces is a pig-casting machine now approaching completion. The molten metal is transferred in ladles from the furnace to the pig machine where it is poured into a master trough. The latter directs it into traveling molds. The pigs are cooled under water prior to their discharge into railroad cars. It is believed this is the first introduction into England of this type of pig machine which was built by Heyl & Patterson, Pittsburgh. One of the new blast furnaces is ready to blow in now and it is expected the other will be in operation by the end of the year.

New Plant Construction

The character of the ore from the Irthlingborough mines will necessitate changing over to the basic process. To meet this requirement two additional 25-ton converters have been built in the bessemer department. A special plant has been provided for calcining, cementing and preparing the dolomite mixture. It has been found necessary to provide special apparatus for manufacturing dolomite brick for the lining of the vessels.

A ramming machine of the Lilleshall company's design is being installed for the purpose of fabricating the convertor bottoms. It is likely that a complete alternation of the rolling-mill department will become necessary. This now is under consideration. One change, perhaps, will be the substitution of electric power for steam except for the main units. These, no doubt, will continue to be operated by steam owing to the fact that greater economies can be affected by conveying power to the outlying portion of the company's property.

The tube plant during the war turned out 100 tons of weldless tubes per week. The company also manufactures a three-link weldless car coupling from a billet by means of Pilot's drop-forging process. Each coupling shows a breaking strain of 100 tons. Approximately 1000 sets of couplings are produced per week. This is the first time that the old method of producing the car coupling has been superseded in Great Britain by mechanical process.

At present the company is building a modern plant with equipment made by Ingersoll-Rand Co. at its limestone quarries for drilling shot holes for blasting purposes. Limestone is handled by means of steam shovels and from the crushing plant is loaded mechanically and conveyed to the works. The crusher, which was constructed by Hadfields, Ltd., Sheffield, Eng., and is said to be the largest unit of its type in Great Britain. It is anticipated that this plant will increase the output of stone to about 1000 tons per 8-hour shift.

A commodious canteen, where hot meals may be had at a moderate cost, was built recently by the company. It is fitted with the latest electrical cooking appliances and is under the control of a works committee. A large area near the works has been set apart for recreation.

Applying Electric Drive to Steel Mills

In a written discussion of the paper on the electrification of reversing steel mills presented by Wilfred Sykes at the recent general meeting of the American Iron and Steel institute, David B. Rushmore, General Electric Co., Schenectady, N. Y., declares that in the future, the present age will stand out distinctly for the enormous rate of progress of the development of what we call industry, the transformation of raw materials into the products that man wants for ultimate consumption, and the use of energy in other forms than manpower for the transformations thus brought about.

Unless we have taken especial pains to see it but few of us realize the importance of the fact that we are drawing our natural sources of energy for all of the products of industry from horsepower hours of energy; that every locomotive, every rail and every part of industry contains a certain number of horsepower hours of energy, and that without them civilization could not exist on the plane on which it does.

In applying electric power to the steel mills there necessarily has been, as in everything else, an evolution. The steel industry is made up of men desiring results and reliability, and accustomed in their minds to rapid changes in methods. If there is one word that applies to this condition it is "progress." Steelmakers have developed the habit of mind of rapid progress which involves throwing away the old and replacing it with the better. Engineers, presidents and operators all have contributed very largely to this condition.

Electrical manufacturers in the main industrial fields in which they work have been very fortunate in having the active and effective cooperation of the men in the industries, and as the necessity on the part of the electrical manufacturer for determining with accuracy and precision the facts concerning the application of electrical machinery has made itself apparent, he has had a very able and close co-operation from men in the industries.

The future of electrical machinery and its application to steel mills is very great. Motors are fairly well developed. Progress is being made continuously. The forms used in some of the mills require a very complete understanding of the electrical phenomena involved. The greatest opportunity for development in electrical machinery, as well as in human beings, is in the function of automatic control, so that the machinery runs, after it is once started in operation, stimulated by the load conditions and not by externally introduced forces of man. Progress along this line is rapid and the field of the future is very great.

With a view to relieving traffic congestion caused by a shortage of cars, the British ministry of transport is pressing the return of railroad material from France, according to a bulletin in *Commerce Reports*. At present cars are being returned at the rate of 500 a week and it is expected this number will be increased to 900 shortly, which would mean the return of all such material to the British isles in six months. Some of this railroad equipment came from the railway companies and will be returned. Locomotives and trucks are being allocated to the railroads according to priority of need.

Public's Interest is Paramount

Problem Before Americans is to Forestall Use of Autocratic Power by Either Labor or Capital, President of the Society of Industrial Engineers Declares—No Panacea for Labor Disputes—Urges Intelligence in Management

BY L. W. WALLACE

FROM time immemorial there have been labor problems, and it is our conviction that, since labor problems have always existed, they will continue to arise as long as humanity is constituted as it is. Therefore, I do not anticipate that at this time, or at any further period there will be evolved a panacea that will forever solve any and all problems that may arise between employer and employe. This is no more possible than that a plan can be evolved whereby there will be no more wars between nations. Indeed plans can be formulated and principles can be laid down which will greatly reduce the probability of labor disputes and which will eliminate the likelihood of many wars. Some form of industrial democracy on one hand and a league of nations on the other unquestionably will be an agent of great value and influence, but those agents within and of themselves will not eliminate labor troubles, nor make impossible future wars.

In recent weeks we have heard much about the efficacy of industrial democracy, of shop committees, of senate and house plan, of collective bargaining, as the panaceas for all labor problems. During the same period, we have had striking examples of the inadequacy of all these plans. Industrial democracy is a misnomer unless fairly and honestly applied. Collective bargaining is a great danger if wrongly applied and is used as an instrument of autocratic power.

There is no panacea, as industrial democracy, profit sharing, committee system, open shop, closed shop or collective bargaining. None of these agencies will accomplish or avail much unless there be behind them and disseminated through every fiber and thread, and spirit of fairness, honesty and justice. If these principles be present, there will be no labor trouble. And again, if they be present, it does not matter much what plan is used. This accounts for many striking examples of the successful management of labor through each of the plans named. Because these successful examples can be pointed out is the reason for the confusion in the minds of many, whereas if a close analysis be made, it would be found that the wholesome conditions existing in each case were not due to the plan in vogue, but to the fact that the employer and the employe, each in turn, was a believer in and a practiser of the cardinal virtues of honesty, fairness and justice. The unfortunate thing is that many employes, many employers, many associations of employes, and many labor organizations have violated and ignored these principles. Through the utter disregard of the principles great damage has been done, and, to quote: "Great powers have been used arbitrarily and autocratically, to exact unmerited profit or compensation by both capital and labor. This policy of exacting profit rather than rendering service has wasted enormous stores of human and natural resources, and has put in places of authority those who seek selfish advantage regardless of the interests of the community."

Must Curb Autocratic Power

The problem before the American public is to evolve those plans and to inaugurate those policies that will make such use of arbitrary and autocratic power a grave offense against the community, and to make it impossible for any such arbitrary power to evoke its wrath against the will and against the welfare of the masses. Such plans should provide severe and sure punishment for the autocratic employer or autocratic labor leader who wilfully violates the principles of honesty, fairness and justice, and by such violations brings hardships, despair and heartaches upon the masses. One is just as guilty as the other and we have had glaring examples of the evils of the financial trust and of the labor trust. Both are equally culpable, and both should be dealt with in like manner.

Many of the abuses have grown up through ignorance of cause and effect. Poor management, incompetent supervision, excessive equipment, large inventories, poor equipment, inadequate sales policies and other causes have resulted in reduced income and a loss of net profits. Ignorance of the causes leads to a misinterpretation of the reason for the effects. In arriving at a solution incompetency in management again shows itself; faulty analyses and incorrect conclusions follow. Wages are cut, demands increased, working conditions made less desirable; all of which is a disregard of the principles of honesty, fairness and justice, the result being strained relationships, strikes, bloodshed, destruction of property, no one being permanently benefited.

Ignorance of cause and effect on the part of labor leads to many misinterpretations and faulty conclusions, such as to believe that to limit production is to benefit the worker, to decrease the length of the workday is conducive to the prosperity and the wellbeing of society and of labor, to oppose the training of the worker, to place all workers in a given trade on a par, regardless of capacity or ability, to demand compensation for which no adequate service has been rendered and to deny the right of individual choice of employment. These policies inevitably lead to reduction of production, increased cost, to suspicion, to the disregard of the rights of property, rights of individuals and rights of society.

It is the function and province of the industrial engineer to make the correct analysis, to predict effects through known causes. It is purely the mission of the industrial engineer of wide experience, of great foresight and of unselfish motive to see to it:

FIRST: That every action is based upon the principles of honesty, fairness and justice to the employe, the employer and the public.

SECOND: To so formulate the plan of action as to eliminate all unfair privilege of the employer and employe and to make it possible for each to fulfill its responsibilities to the community.

THIRD: To so organize the plant or industry as to make it exceedingly difficult for an incompetent to hold a position of authority or to exert autocratic control.

It is exceedingly difficult to formulate the particular steps to be taken to accomplish this commission. In fact it is our thought that no definite and tangible plan of procedure can be formulated which will fit every requirement or occasion. Each plant, each industry, each problem must be aproached in a different manner. But to each must be applied the fundamental principles of

---

From a paper presented at the Cleveland Conference of the Society of Industrial Engineers, Oct. 29-31. The author, L. W. Wallace, is president of the society, and general manager of the Red Cross Institute for the Blind, Baltimore, Md.

honesty, fairness and justice. Any plan of procedure that will insure the observance and enforcement of these principles is justified, and should be applied.

It is the industrial expert who must finally work out these problems. He is the specialist who understands causes and effect. He is the one to make an unbiased and detailed diagnosis and to prescribe the treatment. His treatment may at times be severe, may never be the same for any two cases. It must always be honestly and fairly given, and to be for the good of the employer, the employe and the community. And if the industrial expert is to have the great influence desired and required his conduct, his professional actions and attainments must be such as to merit the confidence and respect of the society in general, as is the case with the medical expert. The industrial expert has just as an important a mission as has the medical, and at the present time, a more critical one, perhaps. So it behooves him to watch closely, move cautiously and to act wisely in all matters.

How to Increase Production

The golden age of the industrial expert is here. The great problem of the world is production. The world is crying for increased production at a reduced price. The cry comes at a time when there is a great labor shortage brought about through the exigencies of war. This cry comes at a time when there is a lowered labor production due to lowered vitality, to a lowered morale and to a magnified spirit of unrest. This cry comes at a time when material required for production is scarce or cannot be easily obtained because of the results and influences of the war. This cry comes at a time when there is chaos in the physical, in the mental, in the spiritual, in the financial and in the material realms of industry.

The answer to the present situation is to increase the rate and to reduce the cost of production. To do so is to make it possible for human labor, scarce, inefficient and chaotic though it may be to produce more than ever before. To do so is to have human labor count for more than ever, in spite of shorter hours and higher wages.

It requires the services, the wisdom and the foresight of the industrial expert to accomplish this. The problem of the industrial expert is to raise the standard of intelligence, loyalty and skill of the workman. This means a detailed study and analysis of the human element that is to be dealt with. It means a clear understanding of the mental attitude, spiritual conception, physical and mental endowments, and the trade skill and appitude of the men. To this knowledge there must be added a detailed and careful analysis of the requirements of the job. Then the appitude and desires of the man must be fitted to the requirements of the job. With this done, a good start has been made toward the realization of efficient and full production. But there remains a very significant factor to be considered, and that is the mental attitude of the worker. You can fit a customer with a pair of shoes or a suit of clothes, yet if you "short change" him or violate any of his rights as a man, or fail to treat him as a human being you do not get a satisfied customer, nor do you obtain satisfactory results. Likewise, you may have intelligent workmen, you may carefully fit them to the job, but if you "short change" them by an adequate wage, or deny them the ordinary rights and privileges of human beings, nothing but disaster will result.

Aside from the purely labor aspects of the present industrial problem, the industrial engineer has a great apportunity. The scarcity of labor must be overcome by increased efficiency of management, of production, of transportation and of consumption. This means that scientific principles must be applied to the problems of management, that old and crude methods of management must be eliminated, that where things have been done by brawn they must be done by machinery, that the lathe that used to do must be scrapped and only those used that will give the largest output in the minimum of time and of cost. Labor-saving devices of every character must be developed and used. To transport material by man power cannot be, in its place, there must be gravity conveyors, automatic hoists, trolley lines.

Idle machinery is not to be tolerated. An 8 or 10-hour production period per day for equipment and plant is intolerable, it must be a 24-hour schedule. Millions of idle capital in raw and finished stores must not be. Quick movement, large turnovers, can only answer. To burn 10 tons of coal when only seven is required will not meet the problem. To have scrappage of 30 per cent when 10 per cent is attainable must cease.

Much Study Involved

It is the industrial engineer who must make the analysis, develop the plans and apply the methods that are required to accomplish these things and to meet the demand for more production at a cheaper cost in the face of high wages and shorter hours. It can be done and it is the only solution to the present industrial situation but it will require concentrated effort, long hours, deep thinking, and careful investigation.

All the problems cannot be solved by an individual engineer because they are too vast, too far-reaching, hence there is large work for the profession to do. United action must be had. The Society of Industrial Engineers offers that medium, and through it many problems must be worked out.

In the field of industrial research much can be done. We do not know all there is to know about the art of cutting metals, of the possibility of gravity conveying, of factory arrangement and construction. The scientific analysis of the mechanical, manual and mental requirements of typical jobs have not been largely worked out. Neither has the methods of selecting the worker for the job been developed to the degree that the conditions demand. These, and many other problems are open to investigation and to research.

The foreign element in American industry is a very grave matter. Much of the present unrest and apprehension is due to this element. A great amount of tact and of profound wisdom will be required to direct this phase of our industrial life into right channels.

Favor Sponsor Plan

Announcement recently was made by the United States bureau of standards of the result of balloting on the future procedure in formulating industrial safety codes. One of the plans proposed provided for the preparation of codes under the leadership of the bureau of standards with the co-operative effort of all interested organizations and under the general supervision of a representative conference committee. The other plan provided for preparing the safety codes by appropriate sponsor organizations under the auspices of the American engineering standards committee as enlarged under a revised constitution.

In conformity with a report of a committee consisting of C. A. Adams, H. W. Forster and E. B. Rosa, ballots were distributed for voting on the two plans. The vote resulted in a decided preference for the second plan. Of those voting in this manner, 75 per cent indicated a desire to join the American engineering standards committee.

The bureau of standards is calling another conference to be held in Washington on or about Dec. 5, 1919.

A merchant wire mill, which draws a diversified line of products, usually carries from 4000 to 5000 pounds of rods in assorted sizes and specifications and requires an accurate system of handling to prevent stocks becoming mixed.

Belgians Receive Foreign Orders

Ten Locomotives for Chinese Government Among Business Taken by Plants Now Rapidly Recovering—Shortage of Coal and Coke, However, Handicaps Entire Industry—Only 545 Out of 2246 Coke Ovens in Operation

BY FRANCIS MILTOUN

French Correspondent of The Iron Trade Review

BELGIUM'S iron and steel industry is making considerable progress toward recovery, all factors considered. The Rodermont plant at Haine-Saint Pierre and the "Metallurgie" at Nivelles and Tubize have received an order in common for ten locomotives for China.

The Metallurgique du Hainaut at Coullet and La Louviere has received an order for a large tonnage of ship plates from the Cockerill yards at Hoboken, presumably owing to the fact that the Cockerill plant at Seraing is not yet in a position to supply the needs of its shipbuilding subsidiary. The same companies have also received an order for rolling stock from the French Orleans railroad.

The Hainaut plants are thus getting outside business which the most optimistic would hardly have thought possible a few months ago. Belgium's trade ambassadors are doing good work. The Chatelineau Thy-Chateau and Marcinelle plants have already been able to light a good proportion of their blast furnaces and set up their rolling mills.

Statistics of Belgian foreign commerce for May and June indicate a very satisfactory situation. It is noted that imports of raw material have greatly increased, as have also the exports of finished products. In May iron ore was imported to the extent of 35,900 tons, and in June the imports increased to 42,052 tons. Imports of pig iron increased from 10,600 to 12,389 tons. Exports of plates increased from 600 to 944 tons, merchant bars from 1000 to 3037 tons and nails from 100 tons to 131 tons. Slight though the figures seem to be, the rate of progress may be accounted satisfactory and many foreign orders in hand are an indication that only the inability to produce in quantity will keep Belgium in the background as an exporter of iron and steel for some months. There is a certainty of a place for Belgium iron and steel in the world's markets. With labor abundant and wages 25 per cent lower than in France and England no one can foresee the possibility of Belgian manufacturers not being able to meet any European competition which may develop, at least after the German mark establishes itself at a level more nearly approaching par.

* * *

Coke and Coal Lacking

Eighteen blast furnaces were in operation in Belgium on Oct. 1, and others ready for operation were only awaiting the arrival in sufficient quantity of coke. Before the war 54 blast furnaces were in full operation. Twenty-five were in the province of Hainaut, 21 in the province of Liege, and eight in Brabant and Luxemburg.

It is officially stated that the lighting of additional coke ovens is seriously hampered by lack of suitable coking coal. France, however, has agreed to furnish 120,000 tons of coking coal forthwith, which will relieve the situation.

On June 1, 1914, the coke ovens of Belgium were distributed as follows: 784 in the Borinage; 486 at Charleroi; 708 at Liege, and 576 in central Belgium. In June, 1919, they were distributed as follows: 666 in the Borinage; 426 at Charleroi; 578 at Liege, and 576 in central Beligum. The following are lighted: 334 in the Borinage; 77 at Charleroi; 77 at Liege, and 155 in central Belgium, of the total, 2246 ovens, all of which are ready for operation, but 545 ovens are actually in operation.

The loss is considerable, taking into account the immediate need of developing Belgium's resources. In May, 1919, ovens in the Borinage produced 29,272 tons, compared with 58,038 tons in 1914; central Belgium produced 16,937 tons, against 50,403; Charleroi produced 6732 tons, against 56,926; Liege produced 5980 tons, against 76,699. The total in May was 58,921 tons as compared with 245,966 in the same month in May, 1914.

* * *

Zinc Industry Picking Up

Belgium was to a large extent dependent on outside sources of supply for its zinc ore, and on foreign consumers for the sale of the zinc. During 10 years previous to 1914 Belgium produced 21.6 per cent of the world's supply of zinc manufactures, exportation being largely in the form of zinc sheets. Despite geographical and geological disadvantages Belgium was able to make the showing she did by reason of having cheap coal and labor.

It is generally considered in Belgium that the industry is sufficiently remunerative to warrant as great a development as possible. Of the eight zinc manufacturing plants in the Liege district three are in operation.

During 1913, 500,000 tons of ore were treated, producing 204,000 tons of zinc sheets of a value of 225,000,000 francs. In 1918, while Belgium was still under German occupation and control, production fell to 8000 tons. The principal source of ore treated in Belgium was Australian, but there is a possibility of obtaining ore from Mexico in the near future.

* * *

Plan Standardization

An effort toward standardizing specifications is being made by 14 steel plants of Belgium. The subject is being studied to determine the profiles to be adopted for standard shapes and rails, and their weights. What is more interesting still is the possible division of business among the firms interested. This is aiming at reduction in production costs and the unification of wages throughout the districts where the firms are located.

* * *

Improving Workmen's Lodgings

Belgium has formed a permanent committee for studying means to be adopted for furnishing dwellings at low rentals for the metallurgical workers of the valley of the Meuse. The need is great for good housing accommodation. In the six most important communes of the Liege district it was found that 4503 persons were lodged in 1079 houses, which is a far better showing than in many industrial centers of France or Great Britain. In 24 communes it was found that liquor was sold in 28 per cent of the buildings occupied by workingmen.

This is the fourth article of a series on the industrial situation in Belgium written by the Paris correspondent of THE IRON TRADE REVIEW after a tour of investigation through that country.

Standardizing Works Methods

System in Management as Well as in Mechanical Operations is of Great Advantage in Eliminating Friction and in Increasing Production—Useful Charts, Developed by Practical Experience, Are Presented

BY M. H. POTTER

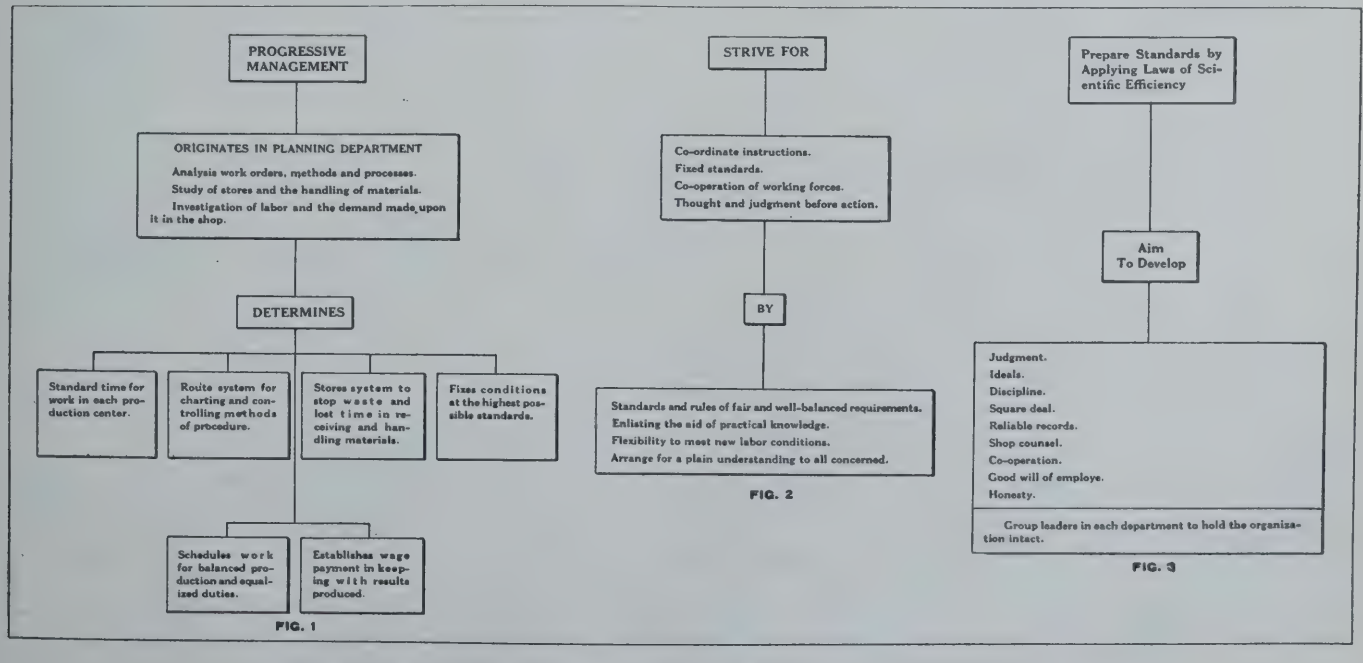
SUCCESSFUL management must aim not only for maximum production at minimum cost but also must maintain a helpful relationship with labor.

Manufacturing standards as here outlined determine the principles of scientific management. No definite laws can be laid down, but the principles, if practically applied, will soon bring about the desired results.

It is necessary when installing a new system of production to consider one department at a time and systematize it thoroughly. In this way it is possible to maintain production under the old method and gradually develop the new.

Fig. 1 shows a plan of progressive management as developed in the standardization of a plant. In the average plant, a general scheme for securing maximum results often is determined on as a standard for the management, but the methods for attaining such results vary greatly. Fig. 2 sets forth the mediums through which efficient plant management may be secured. While the principles outlined apply to any practical industrial undertaking, the manner of securing results will be altered by circumstances. It is for the practical executive, trained in his particular line of work, to determine which is the most important plan from the viewpoint of his own organization.

THIS is the second article of a series on industrial management written for THE IRON TRADE REVIEW *by Mr. Potter. The author shows how much of the success of mechanical operations depends on the system employed for the handling of men, and how standardization may be applied to the duties of various departments, executives and employes to obtain the best results from the standardization of shop practice. In subsequent articles Mr. Potter will deal with other features of successful industrial management.*



Must Develop Foremen

The planning of practical standardization must begin where the business begins, on the receipt of orders, and must follow through the plant, involving both personnel, material and equipment. There will be certain fixed ideals which the system must develop if a co-operative, co-ordinate working organization is to be maintained and if labor troubles and labor turnover are to be minimized. Furthermore it must be the aim of the system to develop leaders in every department, who may at some future time become foremen and superintendents. Fig. 3 further illustrates this feature of progressive plant standardization.

Means for establishing plant standards are illustrated in Fig. 4. Too much attention cannot be devoted to determining the duties of each subexecutive and in setting new standards for him to work to. One of the greatest advantages of the standardization of duties and responsibilities, is to balance the requirements of each executive and the work of each employe. It is also an advantage in developing departmental specialists, men who know one job and know it thoroughly.

Figs. 5, 6 and 7 show the departments concerned with the establishment and maintenance of standardization, and the subdivision of the various departments. The three principal divisions are control, manufacture, and inspection.

The division and subdivision of the various departments is important and should be done carefully in order that standards be set for every important point of the organization and

PLANS FOR PROGRESSIVE MANAGEMENT AS DEVELOPED BY STANDARDIZATION

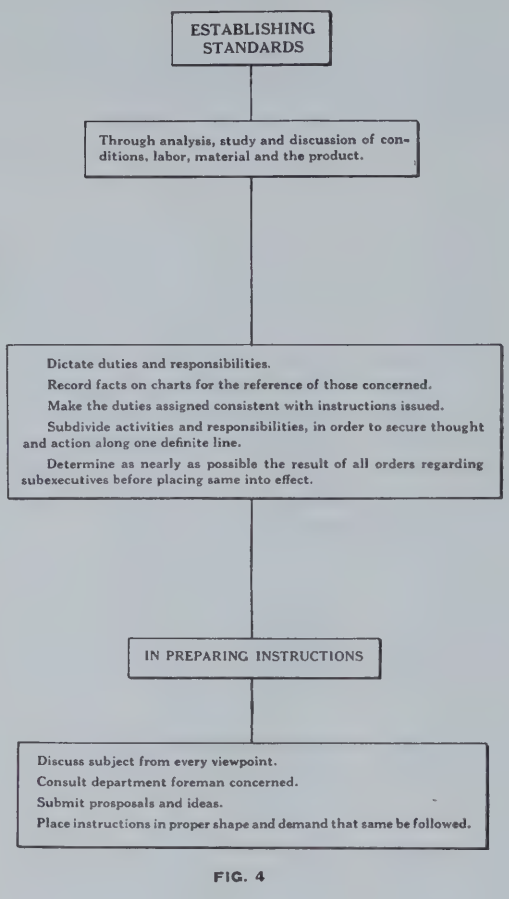


FIG. 4

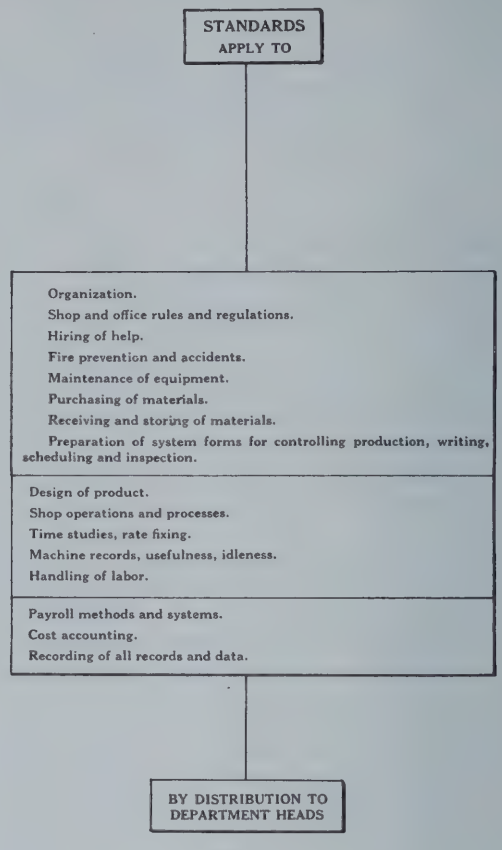

FIG. 5

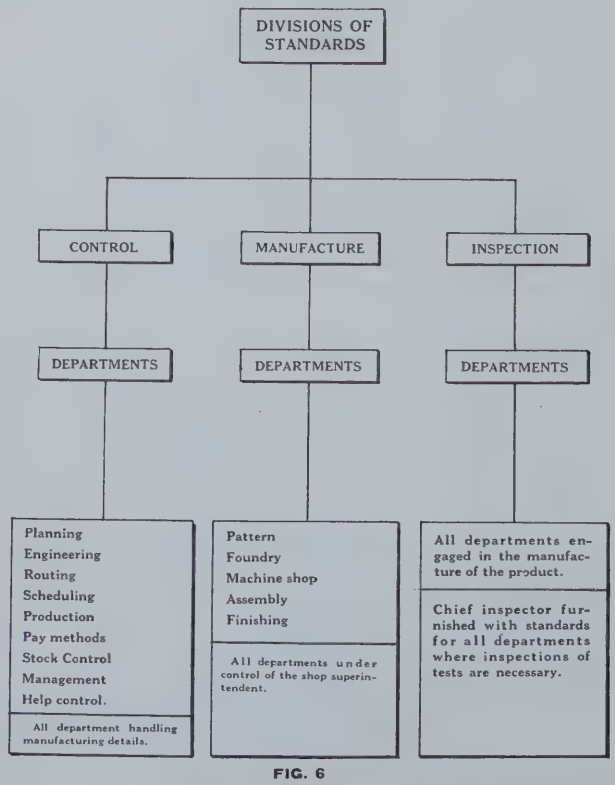

FIG. 6

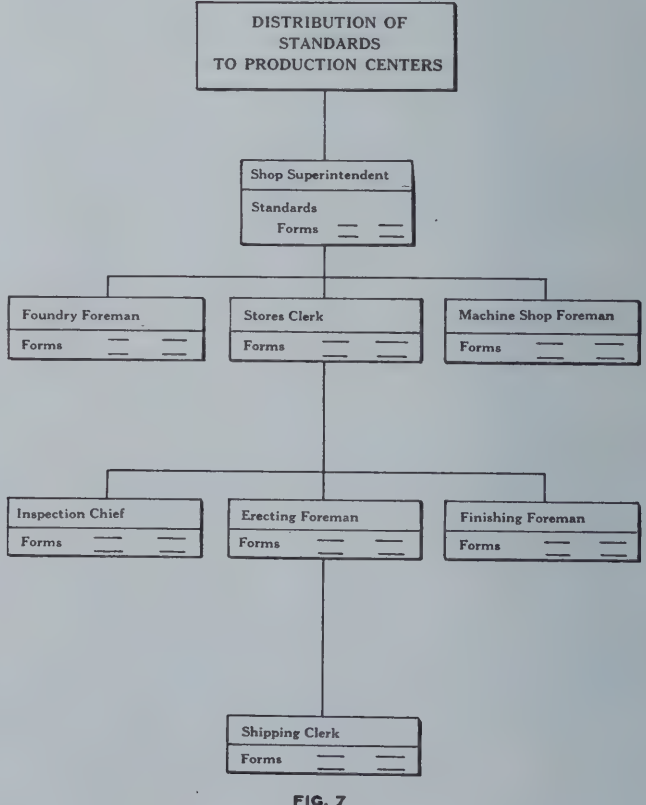

FIG. 7

MEANS FOR ESTABLISHING PLANT STANDARDS, AND THE RELATION OF DEPARTMENTS CONCERNED IN THEIR MAINTENANCE

that no subject be neglected. The forms covering standards should be numbered, a complete set of standards for each department being bound and indexed for reference.

Management Relieved of Details

Manufacturing standards are a definite and uniform means of distributing valuable information through the shop, relieving the management of details. By means of standardization the manager, superintendent and foremen have every detail under control. Plant executives are enabled to tabulate information regarding the business, to circulate it among the workmen in the various departments, and to see that the standards are followed. Furthermore, the executives are not so directly connected with the operation of the plant, and if one should drop out of the organization another might readily take up his duties. Established standards for records also are valuable. In fact, as standards are determined and put into practice many new applications will suggest themselves.

After the divisions and subdivisions of departments have been determined on the manager should consider the subjects to be covered by the standards, taking up one department at a time. In large plants it is important to index standards according to department and subject, and also to list various individuals who should receive the instructions. A careful record should be made of the details concerning the determining of subjects for standards.

Certain standards will apply to all departments and these should be separated from the special or individual standards which apply to but one department. It is a good plan to list standards of a general nature in one form in order to eliminate duplication and to assist in simplifying handbooks of shop standards. Special standards will require special and individual forms.

The application of this rule may vary in different instances. For example, the machine shop of a jobbing shop will fix standards for certain machine operations, which will be determined by the particular machines in the shop. The work of a jobbing shop will vary so that no set standards can be fixed. In a manufacturing plant, however, the standards will deal with the article manufactured.

Careful Analysis First Need

Standards as applied to processes of manufacture should be adopted after careful study and analysis. There is no reason why the best method of procedure should not be definitely recorded; and strict adherence to such standards should be demanded. This will increase uniformity of product.

In establishing standards as outlined in the charts it is important to consult the foreman who is to be responsible for putting them in effect. His views are worthy of consideration from the practical standpoint of wording the standards so that the workmen may readily understand them, and derive the fullest benefit from their use.

FIG. 8—GENERAL STANDARD FOR SHOP FOREMEN
An aid in preventing disputes, attending to routine details and in governing the quality of the product

Standards dealing with the supervision and the clerical routine of the plant will necessarily include many forms and cards. A specimen set should be included in the book of standards. Charts and diagrams will assist in making clear the use of the various standards and their relation to the plant as a whole.

Care should be taken not to incorporate in the foreman's or subexecutive's book of standards such charts and diagrams as will tend to divert his thought or action from the particular department with which he is concerned. At the same time neglect to make clear the relationship of his department with those with which it is directly connected will limit the real value of standardization.

Much Depends on Planning Department

If a careful study of the organization, the plant and the product is made prior to the attempt to fix shop standards the final result will be far better than otherwise. The labor element, and the desired standard of the product will have a direct bearing on the determination of standards capable of reducing the cost of manufacture. It is pointed out in the accompanying charts that progressive management has its origin in the planning department. While this is true, the fact must not be lost sight of that the planning must be separated from the execution and that it is only through the best practical planning that maximum results can be secured.

Furthermore, effective planning, especially in small industrial plants, must deal with more than one particular branch of management. The management must tie together several connected functional branches of management and cover all to the extent required by one. If this policy is not followed then the small plant which attempts to include all forms and branches of scientific management will be more of a recording center than a production center.

The management must determine the elements of scientific management which in his particular case may be corelated, and then work out its own plan. This is not extremely difficult if careful analysis is made and facts and figures are recorded and tabulated in charts and diagrams drawn to represent the work.

The principles of progressive management must be understood before their laws can be applied, but on the other hand such understanding often results in their rejection. This is due, in many instances, to the fact that the management fails to realize and appreciate how these laws apply to its particular case. It does not analyze sufficiently its particular case, workmen, product and the make-up of its organization.

"Dry Drawing" is a term used for drawing No. 20 or coarser wire through lime. The process is used for producing a bright-steel finish and is a much cheaper method of drawing than the wet wire-drawing process.

Pyrometry in Blast Furnace Work

Knowing the Temperature of the Slag and of the Metal it is Possible to Predict Analysis of Following Cast—Results of Temperature Measuring Tests at 32 Blast Furnaces

BY P. H. ROYSTER AND T. L. JOSEPH

FOR a number of years the United States bureau of mines has been investigating certain problems relating to the blast furnace. In the course of these investigations it was desirable to measure, with the optical pyrometer, the temperatures occurring in the hearth of the furnace. The data given in this paper were obtained at 32 blast furnaces operated by 17 companies; 20 of these furnaces were making iron, eight ferromanganese, and five spiegeleisen.

The blast furnace was, by long odds, the earliest piece of industrial apparatus operating above 1400 degrees Cent. It is a furnace, moreover, whose operation is believed to be extremely susceptible to small changes in hearth temperature. Blast furnace legend, in fact, may claim for itself the invention of the first high-temperature pyrometer; that is, if other conditions are the same, high silicon and low sulphur in the metal indicate a high hearth temperature and a drop in silicon while a rise in sulphur, not attributable to other causes, indicates a fall in hearth temperature.

A cloud of uncertainty often hangs over much that goes into and comes out of a blast furnace. Complete analyses of slag are not often made and gas analyses are almost rare, but the writers are not aware of any furnace now operating at which silicon and sulphur is not run on each cast, reported immediately, scrutinized carefully, and discussed earnestly. The furnace operator has found this theorem so satisfactory a guide to furnace operation that he has had no cause to worry over his inability to set down his knowledge of the temperature of his hearth in terms of such and so many degrees centigrade on the gas-thermometer scale. It is easy to understand, therefore, why no attempt at pyrometric control has been made, although instruments able to measure the temperatures encountered have been available for two decades.

Silicon-Sulphur Theorem is Indefinite

It was the writer's purpose in making the temperature measurements reported in this paper to establish, on as definite a quantitative basis as possible, the relation between the temperature in the furnace hearth and the analysis of the metal made. The silicon-sulphur theorem is unfortunately rather indefinite. The silicon, for example, is alleged to depend not only on the temperature but also on the slag composition and volume, the size of the furnace, the tonnage made per day, and the character of the charge. These factors are in doubt in that each can mean one or more of several things. The temperature of the hearth may mean the temperature of the metal or of the slag in the hearth, or it may mean the temperature of the solid stock in the combustion zone or of the products of combustion arising from that zone. By the composition of the slag one usually means its "basicity." This again doesn't meant anything in particular; it may refer to the percentage of lime or of bases, or to the ratio of lime to silica, of bases to silica, of lime to acids, or of bases to acids. The size of the furnace may mean its hearth diameter, its bosh diameter, or its volume; the "character of the stock" may mean anything.

A summary of the temperature measurements made and some of the operating data obtained from the furnace records for 20 iron furnaces are given in Table I. Temperatures measured with a set of Morse-type optical pyrometers are given in the second, third and fourth columns. Under the caption "Tuyere Temperatures," are given the temperature readings observed when the pyrometer was sighted through the tuyere stock and along the axis of the blowpipe, through the tuyere and into the furnace. These temperatures are cor-

Abstract of a paper presented at the one hundred and twenty-first meeting of the American Institute of Mining and Metallurgical Engineers, Chicago, Sept. 22-26. P. H. Royster is assistant physicist and T. L. Joseph is assistant metallurgical chemist, United States bureau of mines.

rected, as well as was practicable, for the absorption of the glass screen in the tuyere sight. The slag and metal temperatures are those observed when the pyrometer was sighted on the surface of the slag and metal streams in their respective runners at flush and at cast. To the observed readings has been applied an appropriate emissivity correction. The figures in the last four columns were taken from the furnace records and have their usual significance. The fuel consumption is given in terms of pounds of carbon in place of the usual pounds of coke per ton of metal.

Determining Temperature

A casual examination of the figures in Table I reveals little to support the theorem that the temperature of the furnace can be determined from the silicon or sulphur in the metal or from any simple relation based on metal and slag analyses. The silicon varies from 0.92 to 2.40 per cent, the tuyere temperature from 1595 to 1862 degrees Cent., the slag temperature from 1437 to 1543 degrees Cent., and the metal temperature from 1426 to 1473 degrees Cent. The range of variation found in this limited number of furnaces is: Silicon, 1.48 per cent; tuyere temperature, 267 degrees Cent.; slag temperature, 106 degrees, and metal temperature, 47 degrees. The silicon in the hottest metal is 1.14 per cent and in the coldest metal 1.05 per cent; the silicon in the metal corresponding to the hottest slag is 1.70 per cent, and in the metal accompanying the coldest slag it is 1.05. The metal made by the furnace having the highest tuyere temperature carries 1.27 per cent silicon. The furnace showing the coldest tuyeres, however, made metal with the lowest silicon; that is, furnace 9, tuyere temperature 1595 degrees and silicon 0.92 per cent.

The 20 furnaces were arranged in the order of the increasing silicon content of the metal and were divided into four groups. The operating quantities for these furnaces were averaged by groups and the results are shown in Table III. It is rather difficult to establish any basis for the silicon-sulphur theorem from these data. The three temperatures that might possibly indicate hearth temperature are included in this table as well as the three expressions that might indicate the basicity of the slag; for the most part none of these six quantities vary markedly with the silicon in the metal. Group I has average basicity and a high hearth temperature; group IV has average hearth temperature and a low basicity; groups II and III have both average hearth temperature and average basicity.

In order to look at these data in the other direction, the furnaces were rearranged in the order of decreasing tuyere temperatures, and averaged in four groups. The results of this arrangement, as given in Table II, show that the slag is uniformly 45 degrees hotter than the metal and that the metal temperature is closely proportional to the tuyere temperatures, the metal temperature rising 8 degrees for every 100 degree increase in tuyere temperature. In this case group IV, with the coldest hearth, shows the highest percentage of silicon.

Calculation of Silicon in Metal

With the aid of more or less complete data on a number of furnaces, it is usually impossible to miss a relation existing between the various quantities once preconceived theories have been discarded. In the present case it can be shown that the silicon in the metal can be calculated from the following equation with an average error of 10 points of silicon and a maximum error of 20 points.

If S = per cent of silicon in metal;
t = temperature of slag, degrees Cent.,
T = tons of metal made in 24 hours;
D = hearth diameter, in feet;
F = pounds of coke per ton of metal;
M = per cent of silica in the coke,
then

$$S = \frac{FM}{47.7} \quad 0.238 + 0.143 \frac{T}{D^2} + 0.0012 \ (t - 1500) \qquad (1)$$

There are insufficient data from the first six furnaces to enable one to compare the actual results with the equation. For the remaining 14 furnaces sufficient data of sorts are available, and the silicon has been calculated from this equation; the results are shown in Table IV.

Calculating Silicon Values

In Fig. 1 the calculated and the actual values of the silicon are shown diagrammatically. It is rather difficult to attribute the agreement solely to coincidence; in fact, it is definitely evident from Table IV and Fig. 1 that the equation is an approximation of the true relation. It must not be concluded, however, that the equation can give the answer to the problem with any finality. It can be regarded as nothing more than the best quantitative expression that has so far been offered for predicting the silicon in the metal.

The interpretation of the equation 1 is rather simple. FM is the pounds of silica per ton of metal in the form of coke ash. This quantity, divided by 47.7, indicates the silicon the metal would carry if all the silica in the coke ash were reduced to silicon and entered the metal and if none of the silica from the ore or from the stone were reduced. Actually, the silica required to produce the silicon in the average metal, for these 14 furnaces, is about 54 per cent of the silica in the coke ash. The

Table III

Furnaces Grouped According to Silicon Content

Group	I	II	III	IV
Furnaces included	5, 6, 9, 14, 20	4, 8, 12, 13, 15	7, 10, 11, 16, 19	1, 2, 3, 14, 20
Silicon in metal	1.02	1.23	1.49	1.96
Sulphur in metal	0.038	0.034	0.033	0.031
Tuyere temperature, degrees C.	1656	1720	1732	1737
Slag temperature, degrees C.	1498	1505	1493	1539

$CaO + MgO/SiO_2 + Al_2O_3$	1.04	1.01	1.01	0.86
Viscosity of slag	480	814	1048	690

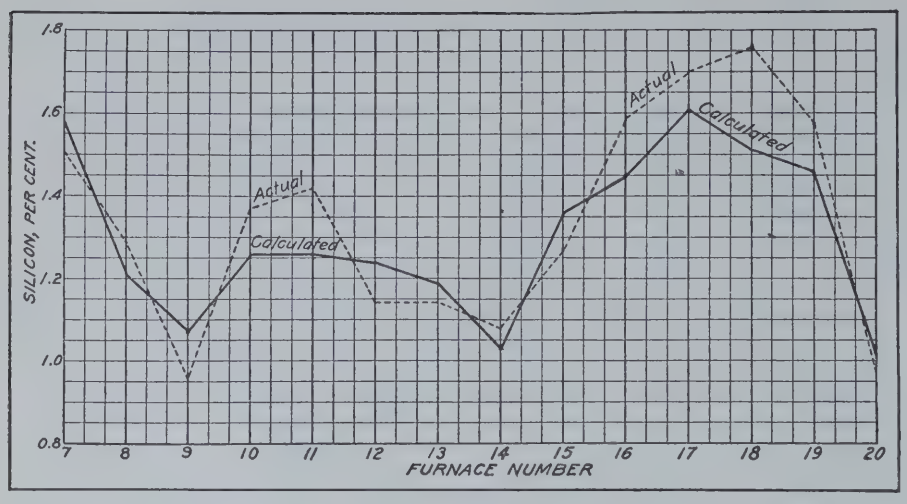

FIG. 1—COMPARISON OF CALCULATED AND ACTUAL CONTENT OF SILICON IN METAL

values for the individual furnaces vary from 47.4 to 66.5 per cent. The furnace "recovers" therefore something better than 50 per cent of the silicon in the coke ash. This silicon recovery varies largely, and almost exclusively, with the tons of metal made per square foot of hearth area. In addition, but to a much less important extent, it varies with the temperature of the slag. An increase of 100 degrees in slag temperature increases the silicon about 0.06 per cent. Since the silicon is thus so slightly affected by the slag temperature, it is obviously impossible practically to determine the slag temperature from the silicon in the metal.

Furnaces have been operated many years on the assumption that the silicon in the metal is a hearth thermometer, and it is undeniable that a cold furnace i. e., a furnace producing low-silicon metal) can be cured by increasing the coke charge per ton of metal. Equation 1 shows that the silicon can be raised by increasing the coke consumption, by virtue of the fact that such an increase in coke consumption increases the amount of silicon in the coke ash, quite independent of any change it might produce in the temperature of the hearth.

Sulphur in the Metal as a Pyrometer

If s = per cent sulphur in metal;
S = per cent sulphur in slag;
t = temperature of metal, in degrees centigrate;
B = ratio $CaO + MgO \div Al_2O_3 + SiO_2$

it can be shown that the empirical equation

$$s = 0.074 + 0.0183\ S - 0.00061\ (t - 1400) - 0.037\ B \qquad (2)$$

agrees with the facts shown in Table 1 within an average error of 0.0045 per cent sulphur. Unlike the expression found for the silicon in the metal, this relation between sulphur and the related operating quantities agrees in a general way with the usual ideas held by furnacemen. The values of the actual sulphur and of the calculated sulphur in the metal for the first 18 furnaces are given in Table V and are shown diagrammatically in Fig. 2.

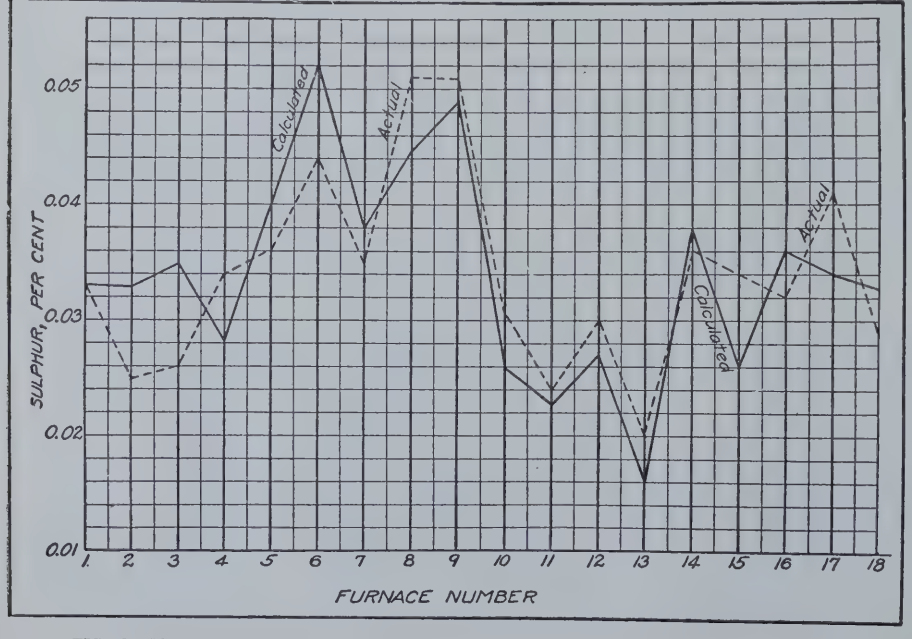

FIG. 2—COMPARISON OF CALCULATED AND ACTUAL CONTENT OF SULPHUR IN METAL

The sulphur is lowered by increasing the ratio of bases to acids, by raising the temperature of the metal, and by lowering the sulphur in the slag. This is the old story of sulphur control but for the first time in quantitative form, and substantiated by a certain amount of proof. The ratio of bases to acids is used as an independent variable here merely because it gives more concordant results than the ratio either of bases to silica, or of lime to silica. In the same way the temperature of the metal is used in preference to the temperature either of the slag or of the tuyeres, because the agreement is better. It must be remembered that both equations 1 and 2 are offered merely as empirical equations found by trial to agree with the observed facts with the consistency shown in Figs. 1 and 2. There will be ample time to theorize about these relations when their truth has been satisfactorily established. It may be of interest to notice, however, that of the three proposed expressions for the "basicity" of the slag the ratio of bases to acids seems to be the most significant.

The sharply defined effect of metal temperature on the sulphur in the metal suggests immediately the use of equation 2 for determining this temperature. If the equation is rewritten

$$t = 1521 + 30\ S - 61\ B - 1666\ s \qquad (3)$$

the temperature of the metal can be directly computed. Since from Table III the slag temperature averages 45 degrees hotter than the metal an approximation to the slag temperature can also be made. This has been done and the results are given in Table VI. It is observed that the maximum discrepancy between the observed and the calculated temperatures is 16 degrees and that the average discrepancy is 7.4 degrees. As the calculated value involves all the errors in chemical analyses for S in the metal, and for CaO, MgO, Al_2O_3, SiO_2, and S in the slag, the agreement is remarkably close. Moreover, the uncertainty in the pyrometer readings on the metal is easily 7 degrees. For any ordinary purpose, calculation gives perfectly satisfactory metal temperatures but the calculated slag temperatures may be 50 degrees in error; the average error for slag temperature is 19.5 degrees. As was shown by Table II a change of 8 degrees corresponds, in a general sort of way, with a 100-degree change in tuyere temperature. Hence it would be expected, and it is found to be true, that an attempt to trace back from

the sulphur in the metal to the tuyere temperature fails.

The facts presented and discussed previously appear to point to a number of conclusions many of which are contrary to what has heretofore been accepted, and which may be of importance to furnace operators. In summary form they may be stated:

1. The silicon in the metal is not dependent on the chemical composition of the slag; the temperature of the hearth; the silica content of the ore; the viscosity of the slag; the blast temperature.

2. The silicon in the metal is dependent on the silica in the coke ash; the speed of operation expressed as tons of metal per day per square foot of hearth area; the slag temperature, but to an almost negligible extent.

3. It is impossible, practically, to estimate the temperature of the combustion zone, of the metal, or of the slag from any simple expression involving silicon content of the metal.

4. The sulphur in the metal is not, in general, lower with high-silicon metal.

5. The sulphur in the metal is dependent on the sulphur in the slag; the temperature of the metal; the ratio of bases to acid.

6. The temperature of the metal can be calculated from the sulphur in the slag, the sulphur in the metal, and the ratio of bases to acids in the slag. The maximum error in this calculation is 16 degrees Cent. and the average error is 7.5 degrees. This error may easily be attributed to errors in chemical analyses, in pyrometric measurements, to both, or to the inaccuracy of the equation from which the temperatures were calculated.

7. The temperature of the slag can be calculated from the same variables with a maximum variation of 50 degrees and with an average error of 19.5 degrees.

To the extent that the furnace operator is satisfied with the production of metal that meets the silicon and sulphur specification, the pyrometer has little to offer. Knowing the temperature of the slag and of the metal it is possible to predict the analysis of the following cast.

There is more to the operation of the blast furnace, however, than controlling the silicon and sulphur content of the metal. The real furnace problem is the production of a given tonnage of metal in the shortest possible time and with the least expenditure of materials. The preceding discussion has not touched that problem. The existence of certain temperatures in the hearth has been shown and their effect has been discussed. A complete pyrometic study of the blast furnace should go further than this, it should attempt to find out the reason for the temperatures observed. Every furnaceman is trying to keep his coke consumption at a minimum; the mark of that minimum, the sign which says he shall not go further, is a cold hearth. It has been shown that a reduction in coke lowers the silicon in the metal without indicating a drop in temperature. There is a possibility, therefore—the writers insist, however, that it is only a possibility—that some furnacemen have stopped on the high side of the minimum from fear of low-silicon iron. It is where a serious attempt is made for a low-coke campaign that the pyrometer promises to be most useful. Take the case of furnaces 15 and 16 in Table I, which were burning 1518 and 1502 pounds of carbon per ton of metal. The pyrometer readings show that there was no danger here of a cold hearth. The metal and slag temperatures are above the average, and the tuyere temperatures are, respectively, the highest and the third highest observed.

Manganese oxide, like silica, is reduced at a higher temperature than iron oxide. It is generally believed, therefore, that a blast furnace making high-silicon pig, spiegeleisen, or ferromanganese must operate with a hotter hearth than a furnace making basic iron. The following figures will show

Table V

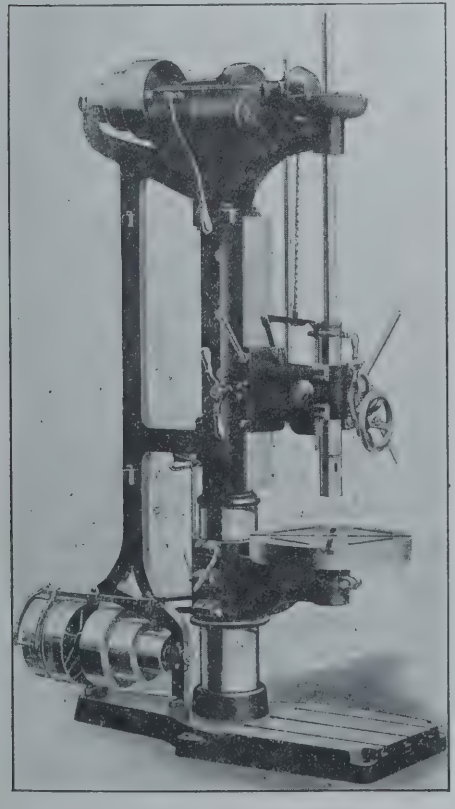
how the temperatures in the manganese alloy furnaces compare with the temperatures in the iron furnaces discussed above.

Furnace	Tuyere Temperature, Average, Degrees C.	Slag Temperature, Average Degrees C.	Metal Temperature, Average, Degrees C.
Iron	1706	1498	1455
Spiegeleisen	1597	1427	1392
Ferromanganese ..	1550	1426	1386

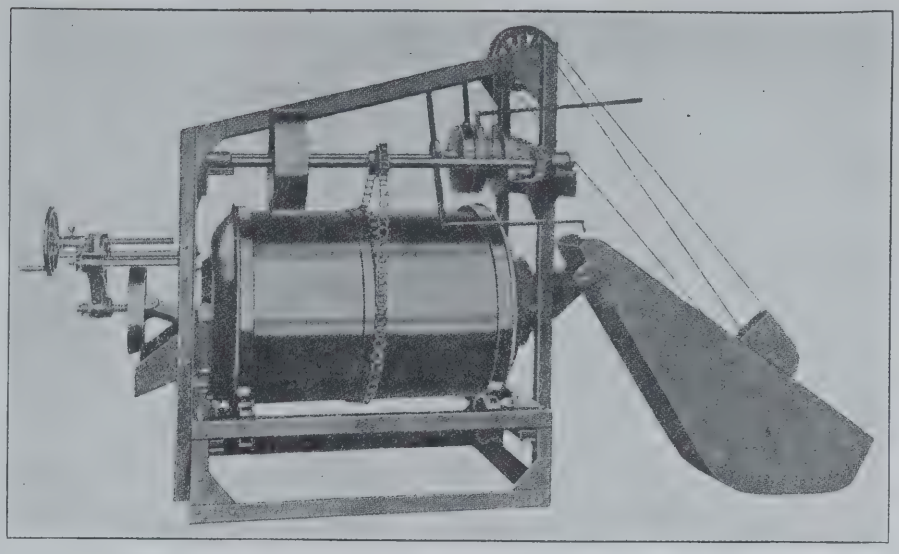
It was concluded as a result of the bureau's investigation of manganese furnaces that an improvement in practice would result from the use of less coke and from increasing the ratio of bases to silica in the slag. As an illustration of the use of the pyrometer in furnace control, the following figures may be of interest. The writers observed the operation of a furnace making ferromanganese for 12 days. Certain of the daily operating quantities are shown in Table 7. The charging of this furnace was done on the basis of the silicon in the metal and of the operator's judgment of the hearth temperature. The ratio of bases to silica was irregular, but in general much too low. It was only on the fourth and twelfth days that it was anything near what it should have been. On these two days the "basicity" was 1.52 and the manganese in the slag was 4.9. The coke consumption was in every case much too high, its effect being to increase the slag volume, lower the basicity, and increase the manganese lost in the slag. The coke consumption on the twelfth day was but 82 per cent of the coke used on the fourth day, but the results were much better, the per cent manganese in the slag being equally low and the slag volume lower. The failure of the silicon thermometric theorem to give the true temperatures or to serve practically as a guide to good operation is evident throughout. Bearing in mind that the average metal temperature in ferromanganese practice is 1386 degrees, it will be seen that this was a hot furnace. On the eighth day, the metal was extremely hot (1514 degrees Cent.) and yet the silicon had dropped over night from 1.78 per cent to 0.40 per cent. The operator, fearing a cold hearth, put on extra coke that day, which took about 24 hours to pass down the stack, running up the coke consumption on the ninth day to the remarkable figure of 10,326 pounds per ton but did not raise the silicon. The tons of metal made on the ninth day was only 38 compared with 47 on the eighth day and an average of about 50 tons per day for the first seven days. It can be shown that it cost the furnace profits about $3000 on the ninth day to conclude that the furnace was getting cold because the silicon dropped from 1.78 per cent to 0.40 per cent.

Invents Safety Brake for Traveling Cranes

For use in connection with overhead traveling cranes, Aaron Heisler, Pittsburgh, has invented and patented a new safety device which he claims will prevent wheeled cranes or the crane structures from traveling



AIR OPERATED DEVICE FOR PREVENTING ACCIDENTS ON OVERHEAD TRAVELING CRANES DUE TO RUNNING PAST SAFE LIMITS



too far upon the supporting rails. As shown in the accompanying illustrations, the safety feature is a sliding bumper which upon contact with another crane or with the end walls of the crane runway applies a brake to the motor shaft.

When the bumper strikes an object in the path of its travel, it moves a wire cable attached to a bellcrank lever, which in turn opens a valve in the air line connecting an air reservoir with a brake cylinder. A rack mounted on the piston of the brake cylinder actuates a pinion on a right and left-threaded shaft of a clasp brake on the crane motor shaft. To release the brake, air is discharged from the brake cylinder through a valve controlled by the cab operator. In order to prevent sudden shock the cable is provided with an air cushioning cylinder which tends to absorb the jar.

To apply the device to the crane it is necessary to install an air tank and pump, piping and necessary fixtures, and a separate motor which, the inventor says, need not be of high power. Fig. 1 is a side view of the crane with the appliance attached. It shows the air tank surmounted by the motor and pump,, the brake cylinder, bell crank and clasp brake. Near the top of the crane is the air cushioning cylinder and the brake wheel. Fig. 2 is an end view of the carriage showing the safety bumper and the cable attached to it. Fig. 3 shows the principal of the brake wheel which is operated by the rack on the piston rod.

UPRIGHT DRILL WITH GEARED FEEDS

TUMBLING BARREL WHICH IS EQUIPPED WITH POWER LOADING DEVICE

Develops Sliding Head Drilling Machine

Selective speeds and feeds of wide range and positive geared feeds are salient features of the sliding head drilling machine shown in the accompanying illustration, which is a recent development of the Sibley Machine Co., South Bend, Ind. The base is ribbed and provided with three T-slots for strapping work in place. When the work is clamped directly to the base, the platen is readily swung aside.

The head and spindle are balanced by a weight in the column suspended by a chain which runs over large diameter sheaves. All gears are enclosed. Belt guards can be furnished as special equipment.

A novel feature of this machine is that all bearings are fitted with split die-cast bushings made of antifriction metal. As these bushings are located in machined seats, all that is required when undue wear develops is to replace the bushings thus assuring correct alignment. The driving pulleys and the 3-step cones are designed to accommodate wide-faced belts thus assuring ample power at all times. The long range of the head and spindle travel permits the use of large jigs. The back gears are of the sliding type, fully encased and operated by one lever. The spindle is equipped with ball thrust bearings.

The geared feed permits of four changes and a neutral position. The feed changes are obtained by moving a knob, located in the center of the hand wheel, in connection with a sliding spline, four feeds being provided for each spindle speed. The initial drive of the feed shaft is from the upper cone shaft through the medium of spur gears and 2:1 spiral gears. This arrangement is said to be compact and due to the fact that the gears run in oil, they are properly lubricated at all times. The spindle quill is actuated by a rack and spur gear, the spur gear shaft being driven through the medium of a worm gear and worm. The worm runs in an oil pocket and is thus self lubricating. An adjustable automatic stop is provided for tripping the power feed at any predetermined point. Quick return of the spindle is had by means of a 3-arm spider at the left of the operator. For hand feeding, a wheel of large diameter is provided.

New Tumbling Barrel Has Power Loader

A tumbling barrel recently developed by the Ideal Concrete Machinery Co., Cincinnati, loads automatically from the ground level and discharges the work directly into buckets or buggies without stopping the rotation of the barrel. To prevent over tumbling or insufficient tumbling, the operator can reach in and take out a sample of the work at any time without interrupting the process.

During the tumbling operation the plug, as shown in the accompanying illustration, is in and closes the barrel. When in this position the hinged chute hangs straight down in the drum so as not to interfere with the tumbling. To discharge, the screw is turned by means of the handwheel which withdraws the plug and brings the chute to the discharge position. A worm of 1½-inch angle iron placed in the inside of the barrel cleans the barrel when discharging.

Barrels are supplied with either a

solid shell, a shell perforated to screen out sand or sawdust or a shell equipped with axial slots to dispose of trimmings. The shell is of ¾-inch steel plate rolled to size and butt welded, while the drum heads are ⅞-inch castings protected from wear by steel bands shrunk around the running track. Chilled iron rollers 12 inches in diameter carry the drum. The power loader skip is raised by power transmitted through a 14-inch contracting band hoist. An automatic stop prevents the loading skip from being hoisted too late. Where an exhaust barrel is desired, the exhaust is taken care of by means of the hollow trunnion in the discharge plug to which a flexible steel tubing is attached. This type of barrel also can be adapted to wet tumbling.

To Sell Equipment

The Delta Equipment Co., 140-142 North Third street, Philadelphia, has just been organized to deal in electrical and steam equipment and new and used machine tools. George B. McClennen and P. J. McBride, both for seven years associated with Frank Toomey, Inc., and Andrew I. Mehan are the organizers. The establishment of the new company follows the purchase of the Delta Electric Engineering Co., which for some time past has been dealing in electric motors and generators. The business of the old company will be continued and broadened to include new and used boilers and other steam equipment and machine tools. In view of his past experience Mr. McClennen will be in direct charge of the machine tool department, while Mr. McBride, who for many years has dealt particularly with steam and electrical equipment, will devote his special attention to the other lines to be handled.

Better Letters Discussed at Convention

That higher standards of business will be attained by higher standards of business letters and the growing importance of letter writing as a phase of modern business, were the salient points brought out at the third annual convention of the Better Letters association, held at Hotel Cleveland, Cleveland, Nov. 20 and 21. More than 100 persons attended the sessions, 80 per cent of whom represented industrial institutions.

Papers read at the convention included: "Historical Sketch of the Better Letters Association," by H. N. Rasely, Norton Co., Worcester, Mass.; "The Business Letter—Its Importance to the Commercial World," by Sidney S. Wilson, Willoughby, O.; "Sales Messages or Letters as the Direct Method of Approach to the Buying Public," by M. G. Webber, Fisk Rubber Co., Chicopee Falls, Mass., and others.

Sidney S. Wilson, president Sidney S. Wilson Co., Willoughby, O., was elected president of the association; H. N. Rasely of the Norton Co., was re-elected secretary, and the following were made directors: R. B. Newton, Wilson & Co., Chicago; John P. Opdycke, New York; Douglas Johnson, Wilmington, Del.; Charles R. Wiers, Larkin Co., Buffalo; L. A. McQueen, B. F. Goodrich Co., Akron, O.; Dr. F. W. Dignan, LaSalle Extension university, Chicago; and E. P. Cramer, Goodyear Tire & Rubber Co., Akron, O. A permanent organization was formed at the meeting. W. O. Rutherford, Akron, O., is the retiring president of the association.

New Industries Springing up in Michigan

Detroit, Nov. 26.—Among the dozen or more industrial organizations which have procured sites in the 4200-acre townsite of Marysville, Mich., being developed by C. Harold Wills and John R. Lee, former officials of the Ford Motor Co., are the Holmes Foundry Co.; Port Huron Engine & Thresher Co., and the General Aluminum & Brass Co.

The Holmes Foundry Co. will be in operation by the end of the year with one of the largest gray iron foundries in the country. The engine and thresher company is preparing for an extensive export business and already is making large shipments of machinery to Argentina.

Announcement of the plans of the Wills-Lee organization will be made public soon. This new concern is planning to produce motor cars in large numbers under the direction of Mr. Wills.

The automobile trade school of the Flint Industrial Fellowship league has established classes in tool designing which are proving successful in meeting the shortage of skilled workers. Organization of the classes was perfected by George T. Merrill, supervisor of tools for the Dort Motor Car Co., and G. J. Doll, master mechanic, and H. E. Thompson, chief tool designer of Buick Motor Co. plant No. 31. The course is divided into two sections, one for designing and the other for practical toolmaking. The school is open to workmen of any factory.

Reduced Output

In Refractories Expected Because of Coal Strike—Ask Higher Prices

Pittsburgh, Nov. 22.—No material improvement has taken place in the shipments of refractories to steel plants and blast furnaces. A marked curtailment of production appears to be immediately ahead because of this condition and the fact that a number of manufacturers who do not own their own coal mines are beginning to get near the end of their reserve stocks. Most of the larger manufacturers have kept their plants going right through the steel strike notwithstanding that the steel manufacturers have been ordering only such supplies as they absolutely required and the result is that the former now are carrying pretty substantial stocks. Consumers are poorly supplied with refractory brick, but lacking the common labor necessary to handle them, they are ordering or specifying only for occasional carloads. No change is noted in prices, but the indications are that the next change will be toward higher levels due to the fact that the two reductions made since the signing of the armistice have carried selling figures in many instances below producing costs and there are no signs yet of any material decline in prices of raw material. It is reported that some makers of magnesite brick already have sought higher prices but this tendency is not general, although shipments of western magnesite east are much restricted by a scarcity of cars, etc.

May Not Return Roads for Year

Senate Not Likely to Begin Discussion of Measure Until After Jan. 1, While Long Debate Over Reimbursement is Indicated—Government Refuses to Buy Material "to Keep Down Private Interests' Debt"

WASHINGTON, Nov. 25.—While opponents and supporters of the league of nations covenant and the peace treaty are divided as to whether or not these documents are dead as the result of the refusal of the senate to ratify them, it is the hope of many members of congress that when it convenes in regular session next Monday it will be possible to take up immediately important domestic legislation not reached during the special session which ended last Wednesday night. The senate was occupied almost entirely with the discussion of the league and the treaty, the primary reason for the calling of the session. The house made more progress, and enacted some measures which the senate hopes to take up soon after the new session begins. This is particularly true of the bill to return the railroads to their private owners and the bill for the upbuilding of an American merchant marine.

May Retain Railroads for Year

Considerable doubt exists, however, that the senate will be able to pass the railroad bill before the first of the year, when it was proposed the railroads should go back to private operation. As a result the opinion prevails that government operation of the railroads will be continued until July 1, 1920, if not for another year. This belief is heightened by reason of the fact that the President last week vetoed the bill restoring rate-making powers to the interstate commerce commission and removing the President's power to initiate rates while the railroads are under railroad control.

Retention of government control over the railroads for another six months, it is pointed out, will give the senate time to consider carefully a railroad regulation bill and to prepare legislation to deal with the labor situation among the railroads and the basic industries. While it has been denied that the senate committee on interstate commerce will withdraw the antistrike clause from its railroad bill, the report persists that this will be done and that if this and other labor legislation is taken up it will be done through a separate measure. In view of the fact that the house, which last week passed the Esch bill restoring the railroads to private ownership, removed from that measure its original labor legislation and inserted instead a mild proposal for voluntary conciliation, it is believed it would not be possible for the conference to agree on the antistrike clause even if it passed the senate. Because of this it has been thought more probable that an attempt to pass such legislation will be made in a separate bill so as not to delay passage of the railroad bill or bring about a hopeless deadlock.

Government May Take $400,000,000

The house, following previous action by the senate, passed the bill for reimbursement to the United States of approximately $400,000,000 from the railroads for new equipment, including cars and locomotives, bought by the government during federal control. The measure enables the President to make the necessary arrangements to finance the equipment, and relieves the government of a considerable obligation that will be taken over by the car equipment trust that is provided for in the bill.

The provisions of the arrangement which are permitted will be that title to all these engines and cars will be given to a corporation which is to be formed with the approval of the railroad administration, and the bankers have agreed to take enough of the trust certificates to provide the United States with $200,000,000 of cash, which otherwise the government would not have. It is expected that the United States will be reimbursed immediately in cash and will have obligations of the car trust corporation secured by the collateral of the engines and cars, so that the government will be repaid the entire debt of approximately $400,000,000 by the time the car trust matures.

Will Buy Minimum of Material

It is evident that the government, even if it does maintain control of the railroads after the first of the year, does not intend to buy any more material than it will absolutely need. When the government turns the railroads back to private management it desires that the debt owing it shall be as small as possible. On the other hand, if the measure providing for the return of the lines is liberal, it is reported the carriers will be prepared to come into the market on a large scale for equipment, and particularly for rails. The house bill differs in some important respects from the senate bill which has been reported, but both measures are accepted as doing justice on the whole to the railroads, and because of this large buying under private operation is expected.

The merchant marine bill passed by the house expresses the same general principles as the bill of the senate committee on commerce, both providing for private ownership and operation of an American fleet, and it is believed the senate soon after the next session will be able to pass a merchant marine measure, and that the two bodies can agree on legislation that will be approved by both branches of congress and accepted by the President.

Control of Dye Imports Extended

Both the senate and house last week passed a resolution extending government control of dye imports through the war trade board until Jan. 15. The measure is directed at proposed German importations. In discussing the bill, Senator Penrose, who introduced it, said the finance committee had unanimously decided that none of the special tariff bills should be taken up until the peace treaty is disposed of and, if administration forces are unsuccessful in efforts to call the treaty up in the senate at the next session, it is likely the bills soon will be taken up after the senate convenes. The bills include proposals for levying duties on importations of magnesite, zinc, tungsten, etc. A subcommittee of the finance committee has completed hearings on the measures carrying duties on zinc and tungsten.

The special senate committee which will present to the senate recommendations for the adoption of a budget system by congress will hold hearings beginning the second week of December. The committee is bipartisan and is headed by Senator

Medill McCormick, Illinois. It proposes to inquire into the budget system developed by foreign countries and by states of this country. The hearings probably will continue for about two weeks.

All Ready for Basing Point Inquiry

WASHINGTON, Nov. 25.—Everything is ready for the steel price basing point hearing before the federal trade commission here next Tuesday morning at 10 o'clock. Letters containing views of individual manufacturers and consumers, chiefly the latter, the majority of whom appear to be against the trade custom, are continuing to arrive, but will not affect arrangements which have been made to go forward with the investigation. Letters also are arriving indicating a large attendance of the representatives of various interests.

The inquiry will not be legal in any aspect in the early stages, the hearing being informal, but orderly and with all of the commissioners participating. Individuals will be given opportunity to be heard and to question. While the commissioners will be interested in hearing all views, it is likely that at first they will pay particular attention to that phase of the question which deals with jurisdiction. They have not made up their minds that they have jurisdiction and this will be determined before they decide whether a formal complaint should be issued.

So far all the parties directly concerned have signified their intention to have representatives present. This includes John S. Miller, of counsel for the Western Association of Rolled Steel Consumers, which instituted the proceedings, and counsel for the United States Steel Corp., the Steel & Tube Co. of America, the Inland Steel Co. and the Interstate Iron & Steel Co., parties defendant.

Among those expecting to be present are A. H. Chamberlain, secretary, the American Iron, Steel and Heavy Hardware association; Albert C. Taylor, secretary, the Eastern Bar Iron association; George I. McIlvaine, secretary, the Association of Tin Plate Manufacturers and the National Pipe and Supplies association; W. E. Dunn, secretary, the Southern Metal Trades association; Cravath & Henderson, attorneys, the Bethlehem Steel Corp.; L. E. Block, G. H. Jones, and H. P. Platt, the Inland Steel Co.; W. L. King, Jones & Laughlin Steel Co.; the Chattanooga Manufacturers' association; F. & G. Taylor Co., Philadelphia; L. D. Perry, the Central Iron & Steel Co.; Richard Jones Jr., the Republic Iron & Steel Co.; Lieut. Col. L. D. Miller, of the war department; James Bowron, the Gulf States Steel Co.; J. E. Frederick, the Kokomo Steel & Wire Co., and the Crawfordsville Wire & Nail Co.; Chadbourne, Babbitt & Wallace, attorneys, the Midvale Steel & Ordnance Co.; C. O. Hadley, the Alan Wood Iron & Steel Co.; W. H. Donner, the Donner Steel Co.; John M. Remsen, Stark Rolling Mill Co.; W. W. Corlett, the United States Steel Corp.; Charles M. Thorp, the Weirton Steel Co.; F. W. Beach, the Mansfield Sheet & Tin Plate Co.; W. O. Collings, Kansas City, Mo.; Charles L. Ortenfeldt, the Oscar Daniel Co.; C. R. Robinson, the Lackawanna Steel Co.; R. W. Poteet, the Stanley Works, New Britain, Conn.; John Donnan, secretary-treasurer, the Southern Hardware Jobbers association; W. J. Echman, the M. B. Farrier Lumber Co.; H. F. Knapp, the Carnegie Steel Co.; Chester W. Cuthell, the Birmingham Steel Corp.; L. A. Manchester, the Youngstown Sheet & Tube Co.; L. E. Thomas, the Reading Iron Co.; E. L. Herndon, the Eastern Steel Co.; J. G. Deericks, the Pittsburgh Steel Co.; Charles W. Howard, the Chattanooga chamber of commerce, and Newman, Poppenhusen, Stern & Johnston, the Interstate Iron & Steel Co.

Canada's Export Steel Trade Growing

Washington, Nov. 25.—Canadian foreign trade in iron and steel products in the year ending Sept. 30, 1919, surpassed that in the previous year by $22,476,943, according to Consul General Foster at Ottawa. Total imports in 1919 were $1,235,830 less than in 1918 while total exports were greater by $21,241,113. While figures are not available showing to what extent the United States participated in this iron and steel business, statistics for the total foreign trade show that of the $886,134,000 imports, which were $12,500,000 less than in 1918, the United States furnished $701,000,000, or $38,500,000 less than in the previous year. On exports, Canada's business this year was $1,201,801,000 in comparison with $157,000,000 more a year ago. In this the United States received $433,337,000, or $13,000,000 more than in 1918.

Surplus Property Worth $1,152,328,305 Sold

Washington, Nov. 25.—Credit sales of surplus property to France and the liberated countries made by the liquidation commission of the war department to Nov. 5 aggregated $550,328,305, not including sales to corporations and individuals in Europe. Sales in the United States reported to Nov. 8 total $602,000,000, or 9.5 per cent more than the total sales in Europe. The total for United States covers sales of real estate and improvements and includes $123,245,240 in sales made prior to the establishment of the office of the director of sales. The grand total of sales is $1,152,328,305.

The value of 22,596 contracts, reported liquidated to Nov. 1 was $2,091,426,000 as compared with $2,128,795,000 reported previously. This reduction of $37,000,000 is due to corrections in official reports.

Strike Retards Shipments of Steel to Canada

Washington, Nov. 25.—Shipments of steel to Canada have fallen off as a result of the steel strike, according to Felix S. Johnson, American consul at Kingston, in a report to the bureau of foreign and domestic commerce. Despite the shortage of steel for sheets, Canadian manufacturers have kept the price down, he said. One manufacturer is planning additions to his factory to provide for a 50 per cent increase in production of sheets. This will tend to lessen the normal quantity of sheets imported, he asserted, but until the additions are effected the present situation is embarrassed by the strike. Many jobbers have sheets contracted for at low prices, he said, and this will continue to have the tendency of keeping prices down.

March Describes Work of Industries Board

Washington, Nov. 25.—Importance of the work of the war industries board and other organizations dealing with the manufacture and procurement of supplies during the war is emphasized in the annual report of Gen. Peyton C. March, chief of staff of the army. The report describes the development of the board and methods used in planning and executing the military program during the war.

General March says that it was only because of the assistance of the allies that this country was given time to mobilize its forces. The country can never again expect to prepare for defense against the attack of a powerful enemy under such favorable conditions. The conclusion drawn is that the United States

should never be caught in such a state of unpreparedness.

To Sell Surplus Tools to Domestic Trade

Washington, Nov. 25.—The war department has reversed its policy of refraining from disrupting the market by disposing of its surplus stocks to the domestic trade. According to a statement, issued last week by the war department, surplus stocks of government-owned machine tools will now be sold to domestic users. The statement follows:

Attention has recently been invited to the pressure that is being brought by members of the National Machine Tool Builders' association upon members of congress to have the legislative branch of the government direct the war department to attempt to market as large a part as possible of its surplus of machine tools in European countries.

The war department has a large stock of surplus machine tools. It is attempting to market these tools to the best advantage of the government, and, with this object in view, is offering machine tools for sale both at home and abroad.

By contract, it sold to Belgian manufacturers more than 2500 machine tools. It is negotiating with the French government for the sale of an additional large number of tools.

But there is a strong demand on the part of American users for certain types of tools of which the war department has a stock. The department stands ready to sell its surplus to these domestic users.

Belgium's Imports

Washington, Nov. 25.—Belgium's imports of iron and steel during the first seven months of 1919 have been announced by the research division of the bureau of foreign and domestic commerce as follows: Pig iron, 68,206 tons; scrap, 20,660 tons; ingots, blooms and billets, 26,122 tons; tin plate, 5911 tons. No figures are available showing what portion of these tonnages was imported from the United States.

Tells of Flood Damage to Furnaces in 1862

A picturesque story of the great flood in the Lehigh river in 1862 which wrought much destruction to the blast furnace plants located along the course of the stream is told by H. Firmstone, of Longdale, Va., in a communication to Richard Peters Jr., of Rogers, Brown & Co., Philadelphia. Mr. Firmstone's attention had been directed to the interesting article entitled "Eastern Pennsylvania Rich in Romance of Iron," in the special convention issue of THE IRON TRADE REVIEW, of Sept. 25 of which Mr. Peters was the author. He refers reminiscently to the plant of the Glendon Iron Co., at Easton, Pa., which his family had operated for some years.

"Referring to the picture in the oval on page 115, entitled 'Original Plant of Glendon Iron Co., near Easton, Pa., as it appeared about 1870,' I wish to say that I had entirely forgotten the existence of this picture until it appeared in your article, when I at once recollected that my father had this picture taken after the great flood in the Lehigh river in the late spring or early summer of 1862, to show the destruction wrought by it on the works. At that time it was well recognized that there was more drift deposited on the flat where the Glendon Iron Works were situated than at any other place on the river. In that flood, all the dams on the upper part of the Lehigh, between Mauch Chunk and White Haven, were washed out, and almost every bridge, both county and railroad, from there to Easton, was swept away. I can very well recall, as a boy, the appearance of the flat at Glendon completely covered, sometimes to a depth of 30 feet, with bridges, houses, saw-logs and drift of every description. The boilers at the old works, as shown by the picture, were supported on cast iron columns, and the picture was taken especially to show where one set of columns had been knocked down by a canal boat. One end of the set of boilers can be seen resting on the columns, the other on the ground. Just in front is the canal boat, partly hidden by a pile of anthracite coal stocked from the canal boats, the crib work along the canal being shown in the foreground.

"At the time of the flood there were three furnaces at Glendon, only one of which was in blast (No. 1). That is the one on the left of the picture, showing the brick tunnel-head, all the furnaces at that time having open tops. No. 2 furnace is behind the right hand chimney in the picture, shedded over, while No. 3 furnace is behind the lefthand chimney and is likewise shedded over. The debris was not cleared away until late in the fall of 1862, when things were got ready and No. 1 furnace was successfully blown out.

"As your note in reference to the picture states, the engine house was circular and of red brick, and stood between No. 2 and No. 3 furnace, and the hemispherical blast receiver formed its top. At that time, all stock for these works was received by canal."

Opens Warehouse

The American Iron Products Co., Inc., 107 Liberty street, New York, has rented a large iron and steel warehouse at Bush Terminal, Brooklyn, N. Y., from which it will make stock deliveries to steamers for export and which it expects will enable it to enter the domestic field as an iron and steel jobber, beginning January, 1920.

Radiator Company Buys Boston Site

One of the largest transactions in waterfront real estate at Boston during the year is that just announced, wherein the American Radiator Co. acquires a large tract for the construction of a factory and warehouse. The new factory will cost over $1,500,000 and will cover 95,000 square feet. This is to be the first of several units. The output of the new plant will be between 40,000 and 50,000 tons per year.

Sintering Plant Starts

The new sintering plant of the Carnegie Steel Co. at Farrell, Pa., was placed in operation Nov. 19. The plant cost $275,000 and is one of the most modern in the country, its daily output being 300 tons. Bartlett & Snow, of Cleveland, had charge of the construction. The plant is electrically driven. O. J. H. Hartsuff is general superintendent.

Officers Elected

At a meeting of organization of the Replogle Steel Co., the following were elected directors: J. Leonard Replogle, chairman; W. H. Brevoort, Harry Payne Whitney, Mortimer L. Schiff, T. Coleman du Pont, Carl Schmidlapp, Charles MacNeill, L. W. Baldwin, and Harry F. Sinclair.

Strike is Called Off

Chicago, Nov. 18.—The strike at the plant of the Standard Steel Car Co., Hammond, Ind., which was virtually over early in September has been called off officially by the international representatives of the trades involved. None of the demands of the strikers was met.

Furnaces Resume

The Riverside Steel Casting Co., Newark, N. J., has completed and placed in operation a new 8-ton acid open-hearth furnace. In addition, this company has a 5-ton acid open-hearth furnace which has been in operation for several years.

The Maytag Co., Newton, Iowa, maker of washing machines, is erecting a large up-to-date foundry. G. W. Smith is works manager.

No Compromise With Radicalism

National Founders Association Calls For Vigorous Combating of Extreme Demands of Organized Labor—Rock Island Arsenal Plan of Operation is Analyzed—Americanization Problem of Aliens Are Considered

INDUSTRIAL unrest in this country during the past year, and the tendency toward radicalism among labor leaders have failed to shake the faith of the leaders of the foundry industry in the future of democratic institutions in this country or of their industry and this fact was reflected strongly at the annual convention of the National Founders' association, held at the Hotel Astor, New York, Nov. 19 and 20. As long as there are men at Washington who, when aroused, will take action to defend the government, speakers at the convention held, the country is safe, for the majority of its people are for the maintenance of law and order. At the same time, the convention felt that the present wave of radicalism and unrest would not be nearly as acute had the government from the first shown a firm hand. To the psychological effects of the circumstances under which the Adamson bill became a law were traced many of the radical demands of labor. Employers generally were cautioned at the convention against any compromise with labor unions as the lesser of two evils and it was shown how the course of labor unionism in recent years has been characterized by intimidation, murder, law-breaking and violence of all kinds and the recent declaration of the American Federation of Labor in support of the coal miners' union, and the declaration of President Gompers of that body that an antistrike law would not be obeyed, were pointed out as indications that any general recognition of the labor unions would be the first step in a headlong plunge toward sovietism in this country. Satisfaction was expressed at the convention over the fact that the recent steel strike was the means of bringing squarely before the public the question of the open and closed shop.

Condemns the Radicalism of Organized Labor

GEORGE F. MONAGHAN, general counsel of the National Founders' association, delivered an impressive address on the subject of "Industrial Unrest." As long as there are in Washington men, who when aroused, have the courage to take action such as that which has been taken in Washington recently, Mr. Monaghan said, the country's future is safe. A feature of the present industrial unrest, Mr. Monaghan said, is the character of the men who are preaching radicalism. The ranks of those who are working for syndicalism and sovietism in this country include men of brilliant minds who are in the ranks of the journalists and college professors. He read extracts from the recent productions of the radical writers to show their insidious character when brought to the attention of the average worker, and Mr. Monaghan deplored the fact that very little work is being done to offset the arguments of the radicals. He ventured the statement that the average employer in debate against the average socialist, would be worsted in 15 minutes, due to the fact that the latter is more skilled in the use of the arguments advanced by his side.

The fallacy of collective bargaining, which was the rock upon which the industrial conference at Washington split, said Mr. Monaghan, must be at once apparent to anyone who has an understanding of the factors involved, and who has followed the record of labor unionism in this country. That contracts with the American Federation of Labor are valueless, he said, is proved by the developments in the coal strike, and in the longshoremen's and printers' strikes in New York. As the declaration of independence was the prelude to the constitution, Mr. Monaghan said, so the general recognition of the American Federation of Labor would be the prelude to sovietism. To those who in the present troublous times would choose the unions as the lesser of two evils, Mr. Monaghan pointed out the record of trade unionism, covering continued intimidation, sabotage and murder, Harry Orchards' confessions, the developments in the McNamara trial, the refusal of Gompers to obey the injunction in the Buck Stove & Range Co. case, the declaration of the American Federation of Labor officials of sympathy with the mine workers, the declaration of Gompers that he would refuse to obey any antistrike law. He emphatically declared his objection to placing a crown of conservatism on the American Federation of Labor.

William H. Van Dervoort, president, Root & Van Dervoort Engineering Co., Moline, Ill., formerly treasurer of the National Metal Trades association, in an address entitled "Government Competition in Industry" told of an investigation of the system in vogue at the Rock Island arsenal. Although the workers there do not select their foremen and have nothing to do with the management of the plant as has been alleged, he said, they maintain a sales organization in Washington whose duty it is to see that there always is enough work at the arsenal to keep the men there employed. In making up bids on government work, it is customary to make no allowance for a profit. Each employe gets a month's vacation with pay, which, with legal holidays and Sundays, make a total of 43 days off per year. In making up bids, the arsenal, although representing an investment of $35,000,000, is not required to make any allowance for depreciation, and materials are figured at cost, although where materials have been bought at prices which are higher than the prevailing market, they are brought down by the action of the board of officers, in order to lower bids. The Rock

National Officers

President—William H. Barr, Lumen Bearing Co., Buffalo.

Vice President—J. Goslin, Joubert & Goslin Machine & Foundry Co., Birmingham, Ala.

Commissioner—A. E. McClintock, Chicago.

Secretary—J. M. Taylor, Chicago.

Treasurer—Chicago Trust Co., Chicago.

Island arsenal, Mr. Van Dervoort said, is about 90 per cent organized.

The situation at the Rock Island arsenal, Mr. Van Dervoort said, paved the way for efforts to unionize the shops in that district, but this movement met with little success. To further relations between employer and employe, Mr. Van Dervoort recommended the use of mass meetings upon necessary occasions, to give the employer an opportunity to state what is in his mind and to tell what is in the minds of his employes. Such meetings, he said, give an opportunity for submitting matters to a referendum of the employes, thus promoting co-operation between them and the management. Mr. Van Dervoort spoke of the necessity for proper remuneration of employes, saying that it is an object of his company to see that the condition of the workers is improved from year to year, and that remuneration is made as great as possible.

Says British Leaders Excel

Prof. J. Laurence Laughlin, economic advisor of the National Industrial conference board, in comparing British and American labor problems, characterized British labor leaders as being intellectually and culturally superior to the labor leaders of the United States. In England, labor is homogenous and is more highly organized than in this country. He estimated that labor in Great Britain is 40 per cent organized, whereas it is only 10 to 15 per cent organized here. The views of labor are more advanced in England than here, Professor Laughlin said, but while there is more socialism there, British workmen have a more widespread, inbred respect for law and order than the workers here. It is characteristic of British workers at this time that they expect, somewhere and through some agency outside of themselves, to get luxuries, and this outside influence generally is the government. Hence, labor agitation in England is a matter of politics, and so-called "direct action" is taken in order to force the government, through violence, to secure for the men what they cannot obtain legally. One characteristic feature of the wave of radicalism in England is the emergence of the theory of key industries and key groups of workers. The alliance between the coal miners and the railway and transport workers in Great Britain, Professor Laughlin said, was expected to prove invulnerable, but when the railway strike was called, the government and the general public united to break it, and he contended that any such alliance in this country similarly would be doomed to failure.

Professor Laughlin denied that British employers are in favor of general unionization of industry. This impression has resulted from the fact that the government, by skillful maneuvering, has been led to foster unionization on the theory that when dealing with union leaders, it must have the assurance that these leaders are representative of the great body of workmen and not a portion of it. Professor Laughlin deplored the psychological effects of the circumstances under which the Adamson law was passed and he stated that not coddling but quick and sharp impression of all disorder is essential in such situations as the present. If order is maintained, he said, strikes never amount to anything.

Deplored the Number System

Richard H. Waldo, manager of the Inter-racial conference, New York, spoke on the problems involved in Americanizing the foreign-speaking peoples in this country. His address was entitled, "The Man with a Number." He deplored the number system which is in use at a great many manufacturing establishments, saying it leads to many complications. Frequently, it has occurred that a man's identity has been lost because of the number system. He said that when leaving the country many men had been held up because they had paid their income tax as a number and were put to the necessity of proving their identity with that number. The numbering system represses individuality, and does not tend toward the fostering of loyalty. Mr. Waldo urged

District Committeemen Chosen For the Coming Year

First District

Enoch Shenton, chairman, Wm. Highton & Sons Co., Nashua, N. H.

C. E. Chesney, vice chairman, General Electric Co., Pittsfield, Mass.

Charles L. Taylor, Taylor & Fenn Co., Hartford, Conn.

H. B. Johnson, General Fire Extinguisher Co., Providence, R. I.

Fred F. Stockwell, Barbour-Stockwell Co., Cambridgeport, Mass.

Second District

H. P. Macdonald, chairman, Snead & Co. Iron Works, Jersey City, N. J.

Louis P. Willsea, vice chairman, the Willsea Works, Rochester, N. Y.

George C. Forgeot, Worthington Pump & Machinery Corp., Buffalo, N. Y.

James Eastwood, Benjamin Eastwood Co., Paterson, N. J.

W. H. Thomas, Straight-Line Engine Co., Syracuse, N. Y.

Third District

J. Turner Moore, chairman, Reading Steel Casting Co., Reading, Pa.

Alex. Jarecki, vice chairman, Jarecki Mfg. Co., Erie, Pa.

J. P. Allen, Union Steel Casting Co., Pittsburgh, Pa.

Charles W. Asbury, Enterprise Mfg. Co. of Pennsylvania, Philadelphia, Pa.

David Boies, Spencer Heater Co., Scranton, Pa.

Fourth District

Samuel Blackburn, chairman, John B. Morris Foundry Co., Cincinnati, O.

C. W. Russell, vice chairman, Russell Wheel & Foundry Co., Detroit, Mich.

William M. Taylor, Chandler & Taylor Co., Indianapolis, Ind.

J. M. Bashline, Star Drilling Machine Co., Akron, O.

I. A. Wyant, Campbell, Wyant & Cannon Foundry Co., Muskegon, Mich.

Fifth District

John B. Strauch, chairman, More-Jones Brass & Metal Co., St. Louis.

A. H. Head, vice chairman, Waterloo Gasoline Engine Co., Waterloo, Iowa.

C. H. Cole, United Iron Works Co., Kansas City, Mo.

F. E. Place, Buda Co., Harvey, Ill.

Horace R. Culling, Carondelet Foundry Co., St. Louis.

Sixth District

Fred M. Prescott, chairman, the Prescott Co., Menominee, Mich.

John G. Osborne, vice chairman, Lakeside Malleable Castings Co., Racine, Wis.

L. R. Barrett, Vulcan Iron Works, Winnipeg, Can.

Oliver Crosby, American Hoist & Derrick Co., St. Paul, Minn.

F. L. Sivyer, Sivyer Steel Casting Co., Milwaukee, Wis.

Seventh District

H. Cockshutt, chairman, Cockshutt Plow Co., Brantford, Ont.

W. M. Gartshore, vice chairman, McClary Mfg. Co., London, Ont.

E. H. Jones, Canadian Yale & Towne, Ltd., St. Catharines, Ont.

M. P. White, Canadian Allis-Chalmers Co., Toronto, Ont.

C. L. Jobb, Canada Iron Foundries, Ltd., Montreal, Que.

Eighth District

Z. W. Wheland, chairman, the Wheland Co., Chattanooga, Tenn.

W. S. Mosher, vice chairman, Mosher Mfg. Co., Dallas, Tex.

W. D. Tynes, Hardie-Tynes Mfg. Co., Birmingham, Ala.

L. J. Black, Beaumont Iron Works Co., Beaumont, Tex.

George M. Morrow Jr., Birmingham Machine & Foundry Co., Birmingham, Ala.

Honorary Member

O. P. Briggs, Minneapolis, Minn.

the need for study of the personalities and individualities of racial groups as well as of individuals, and he thought that the application of the lessons learned from such a study would do much to settle the present undigested situation in this country. Investigations by the Inter-racial counsel, Mr. Waldo said, have shown that conditions in about 15 per cent of the plants of the country are very bad, while an additional 15 per cent is comprised of the closed union shops, thus leaving 70 per cent of the plants that are in good condition and beyond just criticism. He urged the necessity for maintaining good conditions at all plants, since the plants having bad conditions are pointed out as typical.

Mr. Waldo pled for adequate support of the foreign language press of the country, saying that the non-English speaking foreigner must depend on this press for the material upon which he bases his opinions. Of the 1232 foreign language publications in this country, he said there are 61 radical papers that ought to be suppressed, but he cited the failure of the German military authorities to suppress newspapers in Belgium as an example of the futility of trying to suppress the printing press. By far, the majority of the foreign language publications here are safe and conservative American newspapers, and they form the best media for reaching the foreign-speaking population. Unfortunately, Mr. Waldo said, these publications have not been adequately supported, plans are being worked out to remedy this condition.

James A. Emery, counsel of the national council for industrial defense, described at some length the Washington industrial conference. He stated there is no justification for the impression prevailing in some quarters that the failure of the conference was due to the bigotry of employers. It was the unreasonable and unamerican attitude of the American Federation of Labor, he said, that led to failure of the conference and he cited the refusal of President Gompers to reply to questions as to the resolution proposed by the American Federation of Labor, upon which the conference split. Mr. Emery expressed his gratification over the refusal of the employers' group to compromise with principles that are wrong, and he said that it should be a cardinal principle with employers that they never should give voice to anything but what they actually mean and that they should say it in a way that cannot be misinterpreted.

H. P. Bole, vice president of the Hydraulic Pressed Steel Co., Cleveland, described the industrial association in Cleveland, which affords opportunities for employers and employes to exchange their views upon a common ground.

L. R. Clausen, Deere & Co., Moline, Ill., delivered an impressive address on "The Right of Individual Contract." He attacked the principle of collective bargaining, saying that this principle tends to curb instinctive characteristics such as initiative, ambition, and the desire to own property. Each individual has certain inalienable constitutional rights, Mr. Clausen said, including life, liberty, the pursuit of happiness, the right to work and to obtain returns for his work and the right to bargain and contract individually. When men agree to bargain collectively, he said, they, in effect, surrender all of these rights, excepting the right to live. Mr. Clausen detailed the recent crisis at Waterloo, Iowa, where the American Federation of Labor conducted an aggressive campaign against open shops. This attempt, Mr. Clausen said, successfully was resisted by the employers at Waterloo, but not without a great deal of turmoil, and actual refusal of the constituted authorities to suppress disorder. One outcome of the struggle is that the employers of Waterloo now are hiring workers only on the basis of individual contracts. These contracts must be read carefully by the men before they sign them, and they provide that the employe will join no unions nor do anything to oppose the open shop principle while he is in the employ of the company. In other worrds, employers discriminate only against such workers as oppose the open shop. A feature of the system at Waterloo, Mr. Clausen said, is the interest of the employers in the welfare of the men. Records of pay are maintained constantly and every opportunity is extended to the workers to enable them to increase their pay and thus improve their condition. Where wages are not increased, the company at once conducts an investigation to determine the trouble, with the result that correctives generally are found

Professor Wells, of Sibley college, Cornell university, detailed plans which have been proposed at Cornell for furthering interest in foundry work as a profession, and it is proposed to give engineering students an opportunity during their vacations, to work in representative foundries. It further is proposed to provide a course which may be attended by foundry foremen and superintendents over brief periods.

M. P. White, Toronto, described the Ontario Foundrymen's association, which some time ago was organized to deal with labor, and its operation, he said, has been accompanied by highly successful results.

H. J. Boggis, chairman of the membership committee, reported 83 new members and a total membership at the present time of 652 plants.

A. E. McClintock, commissioner, detailed the association's resistance during the past year to the campaign of the molders' union under cover of its drive for an 8-hour day and 44-hour week with increased pay to extend the closed union shop. Mr. McClintock told of the difficulty in inducing boys to take up molding, with the result that while a great many laborers are being taught the art of machine molding, but few molders are being developed. Some members of the association, he said, are meeting this problem by employing one or more molders' instructors, whose duty it is to provide intensive training for recruits. It is a mistake, Mr. McClintock thought to leave the work of training molders to foremen who are overburdened with other work.

F. G. Smith, the Cleveland-Osborn Mfg. Co., Cleveland, was given an opportunity to tell about the newly organized Foundry Equipment Manufacturers' association. The foundry equipment manufacturers, Mr. Smith said, first came together at the call of the chamber of commerce of the United States, during the war, and it was decided to organize the association in order to make permanent the benefits of co-operation. Mr. Smith stated that a great deal of information of a helpful character concerning the operation of foundry equipment, has been gathered together and arranged in the form of bulletins and that with the consent of foundry operators, these bulletins will be distributed among the foundry foremen and superintendents. Mr. Smith explained that the foundrymen generally, will reap the benefit of the work of the Foundry Equipment Manufacturers' association, saying that all of the members are anxious to have all foundry equipment function efficiently. In undertaking such co-operation, Mr. Smith said, the manufacturers of foundry equipment are convinced there is going to be enough demand for all the product the manufacturers can turn out. Replying to Mr. Smith, President Barr gave the assurance that co-operation of this kind would be welcomed by the members of the National Founders' association and he tendered the Foundry Equipment Manufacturers' association the use of the National Founders' association's list of the more important foundries in this country.

Public to Work Out Labor Plan

No Distinctive Groups in New Industrial Conference Called by President Wilson —Present Strikes Will Not be Considered, But Attempt Will be Made to Devise Means for Averting Further Trouble

WASHINGTON, Nov. 25.—With the new industrial conference called by President Wilson to begin its sessions in Washington next Monday, considerable interest is being shown as to what it may accomplish in view of the failure of the first conference to agree on principles looking to industrial peace. In his letter to each of the 17 men whom he has invited to serve in the conference the President makes it plain that it shall not deal directly with any condition which exists today, but rather find "such ways as will avoid the repetition of these deplorable conditions."

It is evident that the President had in mind the fact that the breaking up of the first conference by the bolting of the labor group was due largely to the attempt to deal with existing troubles. It will be recalled that difficulties arose when the labor group attempted to have the conference adopt a resolution calling for arbitration of the steel strike. The labor group's resolution for collective bargaining, which was the immediate cause of the dissolution of the conference, was aimed to force the hands of steel employers and to make them accept the principle of the closed shop.

The new conference, it is proposed, not only shall avoid dealing direct with the steel or coal strike or other labor disturbances, but will be of a different character than the first one. Its makeup follows the suggestion of the public group of the first conference that there be only one body, thus eliminating distinctive lines.

May Follow War Labor Board's Plan

It remains to be seen, however, whether the new conference will accomplish any concrete results and whether it will be able to agree on common principles. By some it is maintained that organized labor's uncompromising spirit will make it impossible for the conference to determine on a plan that will be an effective force in industrial peace.

Reports are in circulation that the new body will seek to work out a scheme for the prevention of strikes and lockouts along the lines employed by the former war labor board. Creation of a body of this kind for peacetime purposes was recommended by the senate committee on education and labor in connection with the report of its investigation of the steel strike. The idea that the new conference might find a workable plan in the labor clause of the peace treaty has lost weight in view of the failure of the senate to ratify the treaty. Moreover, the labor clause was the object of vigorous opposition on both sides of the senate and a reservation has been adopted which practically nullifies it.

The general plan of the new conference, however, according to reports, will be the establishment of a new economic structure for capital and labor to meet the present urgent situation in industry and the creation of a national labor policy and adjustment board which would be given power to enforce the principles set up to do away with strikes and lockouts. There is some doubt, however, that the conference will strictly adhere to this plan because of opposition by organized labor. The board would not be invested with power for compulsory arbitration, but it would stand ready to serve either one or both bodies to a dispute and to make industrial investigations upon its own initiative, the outstanding aim being to serve the public. Its decision, according to those conceiving the idea, would not be legally binding, but would depend on public opinion to compel obedience.

The board would consist of three representatives of labor, three of capital and three of the public, and under it would be a series of industrial boards, apportioned according to the various industries, equally represented as between capital and labor. These boards would have original jurisdiction in all cases and be required to select an umpire from a list to be furnished by the labor policy board where there is disagreement, and the latter would be the source of appeal for interpretation of principles where dispute as to their meaning is existent.

Most of the men appointed to the board by the President are former federal and state officials. Some criticism has been heard that the list on the whole does not inspire confidence because it is not composed of practical men, experienced in industrial problems. Following are the members of the board:

Secretary of Labor William B. Wilson; T. W. Gregory, New York, formerly attorney general under the present administration; George W. Wickersham, New York, attorney general under the Taft administration; Oscar C. Straus, New York, former secretary of commerce; Henry M. Robinson, Pasadena, Cal., former member of the shipping board; Prof. Frank W. Taussig, Cotuit, Mass., former chairman of the tariff commission; Samuel W. McCall, Boston, former governor of Massachusetts; Herbert Hoover, New York, former food administrator; Martin H. Glynn, Albany, N. Y., former governor of New York; Henry C. Stuart, Elk Garden, Va., former governor of Virginia; Dr. W. C. Thompson, Columbus, O., president Ohio State university; Richard Hooker, Springfield, Mass., *Springfield Republican;* George T. Slade, St. Paul, Minn., railroad man; Julius Rosenwald, Chicago, Sears-Roebuck Co.; O. B. Young, New York, lawyer; Dr. H. J. Waters, Manhattan, Kan., agricultural economist, and Stanley King, Boston, shoe manufacturer, and former assistant to Secretary of War Baker in overseeing war contracts.

Hardly had President Wilson made known the names of the delegates whom he had selected for the new conference than organized labor protested against the personnel. The protest is based on the grounds that the conference chiefly represents capital and corporations, although the personnel, except in two or three instances, does not represent such interests. On the other hand it includes men who have strongly supported organized labor. This is what Frank Morrison, secretary of the American Federation of Labor, has to say about the new conference:

"Big business, investing capital, corporation executives, all the elements opposed to organized labor, will be protected by the members of the new conference. The interests of all groups and individuals except the wage-earners will be carefully safeguarded by these gentlemen in their conference work. That is all I have to say."

President Gompers, of the federation, may issue a statement along similar lines.

LABOR NOTES

Employes of the Chicago Ship Building Co., South Chicago, who went on strike just one hour after demanding increased wages and shortened workdays have returned to their places on former terms after being out 10 days. Orders from headquarters of their union sent them back

without explanation of why the strike was called off.

Automobile bodymakers in New York City have gone out on strike after having passed resolutions for a 44-hour week instead of 48 hours and for a wage increase of 15 per cent for workers receiving $35 or less a week and 10 per cent for those receiving more than $35.

The Clinton-Wright Wire Co. of Worcester, Mass., has adopted a program for the medical care of its employes. Dr. C. J. Byrne has been selected as chief surgeon and medical director. The company will have four hospitals, one at the Morgan, the National, the Wright and the Spencer divisions of the company.

Employes of the Westinghouse Electric & Mfg. Co. have opened a co-operative store where they can buy provisions at cost. A large storeroom has been secured at 709 Braddock avenue, East Pittsburgh, just opposite the general works of the company. The scheme is managed entirely by a committee of employes and is endorsed by the management of the company which has placed with the committee its facilities for placing orders with a standing credit where provisions can be purchased at a low cost.

Judge Charles P. Orr of the United States district court at Pittsburgh has decided that coal miners out on strike could not faithfully take the oath of allegiance and remain on strike in opposition to the express desires of the President and refused naturalization to several last week, among them a number who had served in the army during the war.

German Steel Earnings at Low Ebb

(*Special Correspondence*)

BIRMINGHAM, Eng.—Several German iron and steel companies lately have issued their returns of financial results for the year ending June 30 and it is possible to deduct therefrom some inference as to the measure of prosperity realized during the period. The full story is not told, because a portion of the output is distributed through the German Steel syndicate, which has to do with the sale of semifinished steel, railway material, joists and other shapes. All the companies referred to were in former times very well known in Great Britain as big exporters of iron and steel to that company.

Company Absorbs Reserve Fund

It will be noticed that in some cases dividends are being paid out of reserve. The Gutehoffnungs Hutte, of Oberhausen, has a syndicate allotment of 281,000 tons of steel. This company's accounts show that the gross profits earned in 1918-19 are only sufficient to defray the normal rate of depreciation, but by the absorption of the special reserve fund and the balance brought forward it is possible to propose a dividend at the rate of 6 per cent, as compared with 20 per cent in 1917-18.

The Rhenish Steel Works, whose share in the syndicate is 271,000 tons per annum shows gross profits on the prewar basis of conversion of £400,000, but the whole of this sum is required for depreciation. It is intended, however, to pay a dividend of 6 per cent as contrasted with 12½ per cent in the previous year, by the appropriation of the special reserve fund and its addition to the balance brought forward.

The Bochum association for mining and cast steel manufacture has an allotment of 205,000 tons. The directors find it necessary to devote the whole of the gross profits, amounting to £400,000, as compared with £975,000 in the preceding year, to depreciation, the provision for this purpose in 1917-18 having been £375,000. The balance brought forward, however, will permit of the distribution of a dividend of 5 per cent, as against 22½ per cent in the previous year.

The Hoesch Iron & Steel Works Co., of Dortmund, which has an apportionment of 170,000 tons, reports gross profits of £403,000, as contrasted with £1,381,000 in 1917-18. After setting aside £275,000 for depreciation, as against £350,000 in the former year, the accounts show a total loss of £887,000 on the prewar basis of conversion, whereas in the previous year it was possible to pay a dividend at the rate of 39 per cent. The special reserve fund has been drawn upon to the extent of £462,000, partly to cover the loss, while the remainder of the deficit has been carried forward.

In one or two exceptional cases, however, divisible profits have been earned in the past financial year. The Rochling Iron & Steel Works is able to distribute 5 per cent, as compared with 7½ per cent in 1917-18, and the Zypen and Wissen Steel Co. proposes to pay 10 per cent, but in the preceding year the rate was 25 per cent. On the other hand, one of the greatest colliery undertakings —the Harpen Mining Co. which has an allotment of 7,788,000 tons of coal in the Westphalian Coal Syndicate—has incurred a loss of £45,000, as compared with net profits of £770,000 in 1917-18. Nevertheless, the company intends to distribute 5 per cent as against 12 per cent in the previous year, out of the balance forward and by appropriations from the special reserve fund.

Statistics are reaching Great Britain with regard to recent production in the iron trade. The pig iron output was reduced from 576,000 tons in July to 569,000 tons and the average daily output from 18,579 to 18,348 tons. In the same period, the average daily steel output was reduced from 29,494 to 27,294 tons. This, however, shows a decided improvement over the critical month of February, when the pig iron output fell to 409,000 tons, the lowest production since Germany became a great iron producing country.

In her distressed condition, Germany finds some consolation in the restoration of her foreign trade. The *Frankfurter Zeitung* states that Britain is one of the first enemy states to import large quantities of iron goods from Solingen. There are plenty of signs that Germany is greatly hampered in her recovery by a fuel shortage.

Syndicate Provisionally Renewed

Already steps have been taken to make greater use than ever of her famous exporting syndicates. The great Stahlwerksverband syndicate has been provisionally renewed until March 1, 1920, mainly as a result of government intervention aimed at keeping down prices. The syndicate largely lost its reason for existence during and after the war, when the demand for iron and steel far exceeded the supply, so making its former anticompetition policy superfluous. But ultimately the Verband will probably be replaced by a syndicate embracing only the Rhenish-Westphalian steel works, though the Siegerland works, hitherto outside the Verband, will be later invited to join, and the Saar works will be invited to enter into a cartel agreement. The Machine Tool association has created a new organization for standardizing conditions of delivery, and so facilitating exports and home sales. A further tendency is toward combination between the chemical and metallurgical industries, as allied interests.

Men of the Iron Trade

Personal News of a Business Character Regarding the Men of Affairs of the Industry

R. C. ALLEN, recently elected vice president of the Lake Superior Iron Ore association, Cleveland, is a geologist and engineer of broad training and experience. After graduating from the University of Wisconsin in 1905, he spent three years in graduate study and field work for the United States geological survey and private interests in the West, Canada, and the Lake Superior iron ranges. From 1908 to 1913 he was special lecturer in mining geology in the University of Michigan, 1909-1919 state geologist of Michigan, 1913-19 appraiser of mines for the state of Michigan and technical advisor to the Michigan securities commission. During the war he served the government as a member of the tax advisory board, as chief mine valuer and head of the division of natural resources in the United States treasury.

In recent years Mr. Allen has devoted his attention chiefly to the economics of mining with special work in taxation and the theory and practice of valuation of mining property. He is a member of the special committees of the National Tax association and the American Institute of Mining and Metallurgical Engineers on the taxation of mines. The election of Mr. Allen as the vice president of the Lake Superior Iron Ore association is coincident with the broadening of the work of that organization in several directions, particularly in matters pertaining to federal and state taxation.

Mr. Allen is a fellow of the Geological Society of America, member of the American Institute of Mining and Metallurgical Engineers, Lake Superior Mining institute, various other scientific and professional organizations, and is the author of numerous publications on geologic subjects.

Comly B. Shoemaker Jr., has been appointed assistant superintendent of the Roe Puddling department of the Reading Iron Co., Reading, Pa.

O. K. Carpenter, formerly with the Bayonne Steel Casting Co., Bayonne, N. J., now is superintendent of the Millbury Steel Foundry Co., Millbury, Mass.

Paul E. Noe recently was made sales representative in the Cincinnati district for the McInnes Steel Co., Ltd., Corry, Pa. Mr. Noe has quarters at 220 Southern avenue, Cincinnati.

Frank T. Bentley, traffic manager of the Illinois Steel Co., Chicago, was the speaker at a luncheon meeting of the Cleveland Traffic club, Hollenden hotel, held Nov. 20. His subject was: "Railroads and Industrial Traffic Conditions as They Exist Today."

Capt. John Francis, who has been in command of the ordnance department at the United States armory, Springfield, Mass., for the past 17 months, has been transferred to Seven-Pines ordnance department, near Richmond, Va. He has been connected with the Springfield armory ordnance department 18 years and rose from a private.

R. C. ALLEN

G. W. Norris has resigned his position in the pricing department of the Youngstown Sheet & Tube Co. to accept a responsible place in the Cleveland office of the Liberty Steel Products Co.

J. Allen Dillon has been appointed manager of sales in charge of the new office established at 50 East Forty-second street, New York City, by the Pittsburgh Screw & Bolt Co., Pittsburgh.

H. K. Pollard has resigned as sales manager of the Bayonne Steel Casting Co., Bayonne, N. J., effective Dec. 1, to become sales manager of the Deemer Steel Casting Co., Newcastle, Del.

W. R. Dawson has been placed in charge of the branch sales office established in the Bowman building, Third avenue and Ross street, Pittsburgh, by the American Chain Co., New York.

William H. Haward has severed his connection with the sales department of the Youngstown Sheet & Tube Co., Youngstown, O., and has become connected with the Youngstown Boiler & Tank Co., that city, in an official capacity.

Rodney D. Chipp, formerly general manager of the Vulcan Tradings Co., New York, has been appointed to manage the New York office at 120 Liberty street, established by the Forbes-Perkins Co., 84 State street, Boston.

P. J. Walsh has resigned as mine inspector of the ninth bituminous district with headquarters in Connellsville, Pa., and has become general superintendent of mines for the Consolidated Coal & Coke Co., Uniontown, Pa.

William Wood, who was a government inspector during the war at the Rowe Calk & Chain Co., Plantsville, Conn., recently was made manager of the Diamond Chain Co., York, Pa., a subsidiary of the Rowe Calk & Chain Co., Southington, Conn.

Leonard Crooke, formerly with the Koppers Co., Pittsburgh; Lackawanna Steel Co., Buffalo, and the Central Iron & Coal Co., Holt, Ala., has been made general manager of the Montgomery Coal Washing & Mfg. Co., Birmingham, Ala.

P. G. Taylor, formerly with the Union Match Co., Chicago, and the Western Electric Co., Pittsburgh, has been named assistant treasurer of the Savage Arms Corp., Sharon, Pa. He will have charge of accounting in the general office.

Men of the Iron Trade

Personal News of a Business Character Regarding the Men of Affairs of the Industry

GEORGE R. WETTEN and Arvid E. Nissen have become affiliated with the force of the Hess Steel Corp., Baltimore. Mr. Wetten, until recently, was roll designer for the Cyclops Steel Co., Titusville, Pa., and formerly was identified with the Atlas Crucible Steel Co., Dunkirk, N. Y., and the Carbon Steel Co., Pittsburgh. While with the Cyclops company, he designed its new 12-inch mill for rolling carbon and high speed steels and work similar to this will be done by him for the Hess corporation. Mr. Nissen, who becomes assistant superintendent of the melting shop for the Hess corporation, formerly was with the Taylor-Wharton Iron & Steel Co., Highbridge, N. J., as assistant metallurgist. Prior to that he was employed in the open-hearth department of the Illinois Steel Co., Gary, Ind.

Arthur R. Jones, formerly in the Chicago general office of the Interstate Iron & Steel Co., 104 South Michigan avenue, Chicago, has been transferred to Milwaukee to take charge of the recently established office there in the First Wisconsin National bank building. Mr. Jones is assisted by Charles Belik, who also was in the Chicago office formerly.

Charles B. Ellis has become the general manager of sales of the Colorado Vanadium Corp., 30 Church street, New York. The company is just getting its mines at Sawpit, Colo., on a production basis. Mr. Ellis for about 15 years was associated with J. Leonard Replogle as secretary and assistant in Cambria Steel Co. and American Vanadium Co.

Richard M. Van Gaasbeek, head of the department of foundry, Pratt institute, Brooklyn, N. Y., was the speaker at a recent luncheon of the Gray Iron club of New York. Mr. Van Gaasbeek discussed the needs and possibilities for training foundry workers and urged the necessity for employers to co-operate and advise with the schools in their efforts to be of service to them in the training of men already employed and in attracting new men to the industry.

W. T. Hays, who has been general superintendent of the Dominion Steel Foundry Co., Ltd., Hamilton, Ont., for the past four years, recently was transferred to the company's new plant at Vatervliet, N. Y., known as the Adirondack Steel Foundries Corp., where he now is located as works manager. C. W. Sherman, president of the Hamilton company, serves the Vatervliet company in the same capacity. Prior to locating in Canada, Mr. Hays was for five years general superintendent of the Scullin Steel Co., St. Louis.

Arthur B. Mead has been appointed district sales manager for Peter A. Frasse & Co., Inc., 417-421 Canal street, New York, to cover Philadelphia, middle Pennsylvania, southern New Jersey, all of Virginia, Delaware and Maryland. His headquarters will be at 625 Arch street, the address of the Philadelphia office and warehouse. For several years Mr. Mead has been a member of the sales organization in the general offices of the company. Much larger stocks of electric and open hearth tool and alloy steels, polished drill rods, seamless steel tubing, etc., will be carried.

Dr. Clifford B. Connelley, formerly dean of the school of applied sciences, Carnegie Institute of Technology, Pittsburgh, who has been acting commissioner of the Pennsylvania state department of labor and industry, now has been given the full title of this office. Col. John P. Jackson, whose place Doctor Connelley was filling, resigned to enter the military service, but the resignation could not be accepted under the laws of the state while he was in the service. With the acceptance of Colonel Jackson's resignation, Governor Sproul announced the appointment of Doctor Connelley.

Duncan G. Stanblough, general superintendent of the Packard Motor Car Co., Detroit, spoke on ways and means to take care of the present industrial situation in the country before the Executive Club of Employment Managers, of Worcester branch, National Metal Trades association, and the Employers' Association of Worcester county, in Worcester, Nov. 17. The following day he spoke before the Springfield branch, N. M. T. A., and the Employers' Association of Hampden County, in Springfield, Mass.

Clarence E. Mason, for more than 25 years connected with the sales force of the Graton & Knight Mfg. Co., Worcester, Mass., has resigned.

George N. Jeppson, secretary and works manager of the Norton Co., Worcester, Mass., has been elected president of the Skandia Credit union, of that city.

E. M. Kinney, of the General Electric Co., Schenectady, N. Y., was the speaker at the regular monthly meeting of the Engineers Society of Western Pennsylvania, held in the Union Arcade auditorium, Pittsburgh, on Tuesday evening, Nov. 18. His subject was "Radio Apparatus for Aircraft and Ground Stations."

Oscar P. Wadock has resigned as district manager in Chicago for the Jas. Clark Jr., Electric Co., after a 12-year connection, to engage in the manufacture of electric drills, hammers, grinders, etc. He is president and treasurer of the Wodack Electric Tool Corp., 23-27 South Jefferson street, Chicago.

Russell W. Stovel, who recently returned from France, where as a lieutenant-colonel of engineers, he served as chief of the terminal facilities division of the army transport service, has been appointed a consulting engineer of Westinghouse, Church, Kerr & Co., Inc., New York City. He devoted his entire time to the company's electrical and mechanical work. He was graduated from McGill university in 1897 with the degree of electrical engineer. In 1898, he entered the employ of Westinghouse, Church, Kerr & Co. He soon was made assistant engineer and then successively, engineer in charge, mechanical engineer and managing engineer. In 1914, he resigned to become managing engineer for Gibbs & Hill, New York, consulting engineers. He entered military service in October, 1917, and arrived in France, Nov. 8, 1917. He is a member of the American Institute of Electrical Engineers and the American Society of Mechanical Engineers.

Men of the Machinery Trade

Personal News of a Business Character Regarding the Men of Affairs of the Industry

PAUL M. LINCOLN, who for many years has been commercial engineer of the Westinghouse Electric & Mfg. Co., East Pittsburgh, Pa., resigned recently to enter the consulting engineering field and has taken active charge of motor application engineering for the Lincoln Electric Co., Cleveland. Mr. Lincoln is credited with having designed and installed the first hydroelectric power plant at Niagara Falls, and subsequently directed its operation for six years. He developed the first high voltage transmission lines and is considered an authority on this subject. Among his inventions is a synchronizer for paralleling large electric alternators. He was elected president of the American Institute of Electrical Engineers in 1914.

His work with the Lincoln company will involve the entire problem of motor drive for machinery, particularly the determination of proper type, characteristics and size of motors best adapted for the service.

Theodore C. Greene, employment manager of the Graton & Knight Mfg. Co., Worcester, Mass., has resigned.

Alexander C. Brown, president of the Brown Hoisting Machinery Co., of Cleveland, has been elected president of the northeastern Ohio division of the National Safety council.

B. H. Lundahl has been appointed manager of the Detroit office of the Link Belt Co. L. W. Longan will continue in charge of drive chain sales in the Detroit district.

C. H. Brennen, formerly purchasing agent for the Hupp Motor Car Corp., Detroit, has become associated with Everitt Bros., Detroit, auto body builders.

Carl Edward Johansson, inventor of the Swedish gaging system, largely instrumental in the development of quantity production of motor cars, was a recent visitor in Detroit, as guest of the Charles A. Strelinger Co., machine and tool dealer. Mr. Johansson now is visiting in America for the first time since he left this country 35 years ago and gave a most interesting talk on his experiences since that time. He explained his latest achievement—a set of gage blocks which are said to be divided to the one-millionth part of an inch within an accuracy of two ten-millionths of an inch.

Capt. Percival Dodge has been appointed sales manager of the Denby Motor Truck Co., Detroit. Five years ago he entered the plant of the Denby company as a mechanic.

Charles D. Hastings, formerly vice president and general manager, has been elected president of the Hupp Motor Car Corp., Detroit, succeeding J. Walter Drake, who becomes chairman of the board.

PAUL M. LINCOLN

William T. Norton, formerly of the Republic Motor Truck Co., Alma, Mich., has been appointed assistant chief engineer of the engineering branch of the motor transport corps of the United States army.

George B. McClennen, who for the past seven years has been identified with the machine tool department of Frank Toomey, Inc., Philadelphia, resigned recently, as did P. J. McBride, who in the same period was in the steam and electrical department. They with Andrew I. Mehan have purchased the Delta Electric Engineering Co., and have changed the name to the Delta Equipment Co., 140-142 North Third street, Philadelphia.

R. H. Brown has been placed in charge of the Dallas, Tex., branch office in the Sam Houston Life building, of the Ingersoll-Rand Co., New York. He formerly was in the company's St. Louis office, and now will cover the Texas and Oklahoma territories.

William H. Nash, of the Timken-Detroit Axle Co., Detroit, becomes sales manager of the Beaver Mfg. Co., Milwaukee, Dec. 1. The company manufactures gas engines. He has been identified with the automotive industry in Detroit for 10 years.

E. A. Goodwin, formerly of Detroit, has been appointed advertising manager of the newly organized Bollstrom Motors, Inc., St. Louis, Mich. The company, capitalized at $300,000, will manufacture a 4-wheel drive motor truck in a building now being erected.

Robert F. Herrick, Milton, Mass., president of the Reed-Prentice Co., Worcester, Mass., who has been touring Europe with his son, has sailed from Liverpool for Brazil and will visit Rio de Janeiro and other South American cities to investigate business conditions before returning to the United States.

Fred W. Duemler, formerly with the Uniflow Boiler Co., Philadelphia, now is manager of sales in the Philadelphia, Pittsburgh and Chicago districts for the Bigelow Co., New Haven, Conn., manufacturer of fire tube and water tube boilers. His headquarters are at 515 Commercial Trust building, Philadelphia.

L. C. Griffin, Baltimore, has been advanced to the position of district manager, with headquarters in Philadelphia, of the Norton Co., Worcester, Mass. Walter Strong, Philadelphia, has succeeded Mr. Griffin as district manager in Baltimore and F. P. Hayes Jr., takes Mr. Strong's place in Philadelphia.

Shops Unite

Steel Fabricators Make Wartime Organization a Permanent Body

The National Steel Fabricators association, formed during the war for the purpose of assisting the government in its war program, became a permanent peacetime organization at a meeting held at the William Penn hotel, Pittsburgh, Nov. 20. Representatives of about 88 fabricating shops attended the meeting and the vote was unanimous in favor of continuing the organization as a permanent body.

An executive committee which will be the governing board of the organization was chosen with Thomas Earle of the Bethlehem Steel Bridge Corp., Bethlehem, Pa., as chairman. Other members of the committee are George P. Bard of the Petroleum Iron Works, Sharon, Pa.; C. J. McIntosh of the Federal Bridge Co., Waukesha, Wis.; G. A. Tretter of the Virginia Bridge & Iron Co., Roanoke, Va.; H. A. Fitch of the Kansas City Construction Co., Kansas City, Mo.; Paul Willis of the Kenwood Bridge Co., Chicago; C. G. Conley of the Mt. Vernon Bridge Co., Mt. Vernon, O.; Clyde MacCornack of the Phoenix Bridge Co., Phoenixville, Pa., and C. M. Denise of the McClintic-Marshall Co., Pittsburgh. Lewis D. Rights of the Shoemaker-Satterthwait Co., Pottstown, Pa., was chosen secretary-treasurer of the organization.

Meetings of the association will be annual affairs at which the problems of this branch of the steel industry will come in for formal and informal discussion. At the organization meeting there was some discussion of the labor situation and of the "fabrication in transit" matter.

Ship Steel by River

Birmingham, Ala., Nov. 25.—The largest shipment of fabricated steel so far made by way of the Warrior river from Birmingham to the plant of the Chickasaw Shipbuilding & Car Co., Mobile, recently was started. Ten carloads of fabricated steel were shipped by rail to Tuscaloosa, 60 miles south of Birmingham, and then placed aboard barges bound for Mobile. The Chickasaw company has taken over the Fairfield works at Birmingham, both being subsidiaries of the Tennessee Coal, Iron & Railroad Co. The Warrior river is to be used extensively in the hauling of steel. Terminals are to be built at Short Creek, within 30 miles of the Fairfield works, a corporation having been formed for that purpose. The river traffic now is almost exclusively coal, which is going down in quantity from mines of the DeBardeleben Coal Co. at Sipsey and Payne Bend. Steel tow boats, steel steamers and barges are being added to the transportation equipment by the government.

Oppose Basing Point

Birmingham, Ala., Nov. 25.—The state of Alabama, through Governor Kilby and Attorney General Smith, has filed a protest with the federal trade commission against the Pittsburgh basing point system. The protest is on the grounds of unlawful restraint of trade and price discrimination, contrary to the provisions of the antitrust act. The Birmingham Civic association is leading the protest from this state, having joined with the Western Association of Iron and Steel consumers some time ago.

Offers Steel Tonnage

Bids are being called for by the office of the zone supply office, war department, 461 Eighth avenue, New York on a large quantity of iron and steel products at the army supply base at Kearny, N. J. This material has been overseas and is now in open storage, so it is stated it is in a rusty condition. In the material offered for bids f.o.b. Kearny, are 1265 tons of flat, round and square steel bars, 7118 net tons of assorted I-beams, 4803 net tons of corrugated roofing sheets, not galvanized, and 480,935 square feet of expanded metal.

Inland Buys More Land

Chicago, Nov. 18.—The Inland Steel Co. has just purchased about 580 acres south of Indiana Harbor as a site for mill expansion. Part of the land has lake frontage, and most of it is marsh which must be filled before being suitable for building purposes. The company recently bought 350 acres at the edge of the city of Indiana Harbor which will be improved with homes for workers, housing conditions demanding attention before further plant expansion can be undertaken.

The Moak Machine & Tool Co., Port Huron, Mich., has opened a new gray casting foundry. E. H. Moak is general manager.

Obituaries

IRA B. HUBBARD, superintendent of the Hubbard Machine Co., Worcester, Mass., of which he was the founder, dropped dead from heart disease in the office of the Tilton Woolen Mills, Tilton, N. H., Nov. 20, aged 69 years.

Daniel T. Russell, for many years vice president of the Lackawanna Coal Co., Buffalo, is dead at his home in Buffalo.

John H. Bannan, for the past 10 years superintendent of the Chapman Valve Mfg. Co., Indian Orchard, Mass., died of pneumonia at his home in that town, Nov. 15, aged 59 years.

William H. Field, head of the William H. Field Co., Boston, builder of woodworking machinery, died suddenly, Nov. 14, aged 61 years. He was the son of William F. Field, who established the business.

Lacy S. McKeever, 58, treasurer and director of the Pittsburgh Testing Laboratory, died at his home in Pittsburgh, Nov. 18. He was born in Westmoreland county, Pa., and came to Pittsburgh about 30 years ago. He had been connected with the Pittsburgh Testing Laboratory for a number of years and also was secretary and treasurer of the Sterling Varnish Co.

J. J. Fisher, a director of the Parkersburgh Iron & Steel Co., Parkersburg, W. Va., and a conspicuous figure in the oil industry, died at his home in Pittsburgh, Nov. 12. He was 81 years old and a native of Pittsburgh.

Charles Burgess, identified for 50 years with the iron and steel industry, died at his home in Titusville, Pa., Nov. 18. He was born in England Oct. 2, 1841, and when a young man he became interested in the iron and steel business. He came to this country in 1866, locating in Pittsburgh and forming a company for the purpose of manufacturing steel under the firm name of Burgess, Aston & Co. In 1870 Mr. Burgess moved to Portsmouth, O., where he started the Burgess Steel & Iron Works. He went to Titusville, Pa., 14 years later and started the Cyclops Steel Co., which he operated for 32 years until March 1, 1916, when he sold it to Carl F. Boker & Sons.

Live Information Which Records the Expansion of Various Lines of Productive Enterprise

THE firm of Hamilton & Hansell, Inc., 13 Park Row, New York City, henceforth will devote its entire business to metallurgical and general engineering work. Development of foreign patents and enterprises will be conducted on a larger scale and a separate company, namely, the American Transmarine Co., has been formed to take over all the general export and import business not relating to engineering. For the past five years, Hamilton & Hansell, Inc., has been licensee and builder of the American Rennerfelt electric furnace for ferrous and nonferrous work. It also has designed a number of electric reduction and electro-chemical plants and work of this character will receive more attention in the future. Contracts closed recently include a 1000-pound furnace for special iron for the A. M. Byers Co., Pittsburgh; a special furnace for glazing fuzed silica for the General Ceramics Co., Perth Amboy, N. J.; a 4-ton furnace for tool steel for export to Sweden; a 300-pound furnace for aluminum alloys for the Bauch Machine Tool Co., Springfield, Mass., and two 1000-pound furnaces for high speed steel for cast tools for the United States High Speed Steel & Tool Corp., Albany, N. Y.

* * *

FORMED by Norman Tilly, 2670 North Sichel street, Los Angeles, and others, the Tilly Brass Mfg. Co. is to manufacture brass products at 145 Llewellyn street, that city.

* * *

CONTRACTS have been closed by the Osborne Casting Co., Layard avenue, Racine, Wis., for extensions and additions to its present plant which will practically double its capacity for 1920.

* * *

WITH its main office and eastern plant at Brooklyn, and a branch plant at Toledo, O., the Doehler Die Casting Co. has purchased a 7-acre tract in Chicago on which a new concrete structure will be erected. The company manufactures die castings in white metal, aluminum and brass alloys, bronze and aluminum backed babbitt line bearings. The new building of the company in Chicago will be completed about Jan. 1.

* * *

THE Superior Brass Foundry Co., Milwaukee, which was recently incorporated with $50,000 capital, by Philip Loeher, Frank Schedler and H. H. Wheeler, has taken over a shop building at 282 Lapham street, and is converting it into a brass and bronze casting shop.

* * *

ADDITIONS to the plant of the Wabash Foundry Co., Wabash, Ind., manufacturer of gray iron castings, have been completed, according to advices from the company. Improvements include installation of a large cupola, traveling cranes and molding machines. No additional improvements are contemplated at this time.

* * *

COMPLETION of an addition now being erected to the plant of the Apex Appliance Co., Chicago, will enable the company to manufacture from four to five times the number of machines it is manufacturing at present, according to O. H. Ehrhardt, secretary. The building will be 2 stories. Some new equipment has been obtained but more will be purchased.

* * *

THE Horizontal Hydraulic Hoist Co., established in Milwaukee several years ago, has transferred its plant and offices to Detroit. The company has been reincorporated in Michigan with a capital stock of $100,000, and the Wisconsin charter dissolved. Edward R. Bacon remains with the Michigan corporation as president and general manager.

* * *

UNDER the laws of Ohio, the Nichols Electric Co., 123-124 North Kenton (formerly Mill) street, Dayton, O., has been incorporated at $30,000, to conduct a wholesale electrical supply business. It now represents the following companies: J. H. Parker & Son, Bryant Electric Co., Ivanhoe Regent Works, Detroit Insulated Wire Co., Bryan Marsh Co., Monarch Electric & Wire Co., National Metal Molding Co., Barkelew Electric Mfg. Co., Chicago Fuse Co. and the Square D. Co. Officers are President and treasurer, M. W. Nichols; vice president, G. D. Carver; secretary, N. J. Meyers, all of whom formerly were connected with the Wm. Hall Electric Co., Dayton, for several years.

* * *

BY the merging of the George S. Good Fire Brick Co., Clearfield Clay Working Co. and the Clearfield County Mining Co., with a capital of $1,155,000, the Crescent Refractories Co., Lock Haven, Pa., has been formed. The officers are: President, A. P. Perley, Williamsport; H. T. Janney, Clarence L. Peaslee and J. B. Graham, Williamsport; and J. M. McKinney, Curwensville.

* * *

CONTRACTORS have started work on the erection of a new plant for the Walker Vehicle Co., 531 West Thirty-ninth street, Chicago. The building will be 1-story and contain about 100,000 square feet of floor space. The present plant of the company will be retained. Title to 20 acres at the new location has been taken by the company to provide for future growth.

* * *

WORK has been started on the first building of the 10 that are to comprise the new plant of the Stevens-Duryea Co., maker of automobiles, on the former Willimansett driving park in Willimansett, Mass. The first unit will be of brick and steel, one story, 300 x 320 feet. The company is planning to start in the spring the erection of 200 houses for workmen employed at the plant.

* * *

FOR the purpose of electro-galvanizing and enameling electric conduit, the Canadian Allis-Chalmers, Ltd., Toronto, Ont., is erecting a new 1-story plant, 65 x 150 feet. Electric monorail cranes will operate over the pickling and plating tanks. Three plating dynamos, each of 5000 amperes and other modern equipment will be installed. In addition to equipment used in zinc plating, baking furnaces and appliances for black enameling of conduit in all sizes will be installed. Approximately 12,000,000 feet of conduit per year will be produced.

Live Information Which Records the Expansion of Various Lines of Productive Enterprise

CONSTRUCTION of a new warehouse for Edgar T. Ward's Sons Co., 3604 South Morgan street, Chicago, steel merchants, has commenced, on a site recently acquired at 1455 West Thirty-seventh street, that city. The site has a total ground area of 52,685 square feet and the 3-story building to be completed as early as possible, will contain an aggregate of 77,000 square feet of floor space. The front of the building will be finished in face brick with terra cotta trimmings. A 10,000-pound capacity elevator will be installed as will all modern features of building construction. At the rear of the lot, a garage to contain 900 square feet will be erected. Vice President Jas. S. Winn of the company has been in charge of the necessary negotiations and S. Scott Joy is the architect who is supervising the work being done by E. W. Sproul Co.

* * *

STOCK deliveries will be made to steamers for export by the American Iron Products Co., Inc., 107 Liberty street, New York, from a large iron and steel warehouse, which it recently rented at Bush terminal, Brooklyn, N. Y. This company also expects to enter the domestic field as an iron and steel jobber shortly after the first of the year.

* * *

WITH new equipment throughout, the Clifford-Jacobs Forging Co., Urbana, Ill., an unincorporated company recently formed, expects to be on a production basis early in January. Its plant is 40 x 250 feet in size and will specialize in heavy forging. Hammer equipment ranges from 1500 to 4000 pounds. W. E. C. Clifford and D. B. Jacobs are the organizers. Mr. Jacobs has had a forging experience dating back 25 years and Mr. Clifford formerly was connected with the First National bank, Champaign, Ill.

* * *

ORGANIZED by Oscar P. Wodack, the Wodack Electric Tool Corp., 23-27 South Jefferson street, Chicago, will manufacture portable electric drills and grinders. It succeeds the Electric Tool Repair & Maintenance Co., which has been repairing and rebuilding electric tools of all kinds for the past three years. Mr. Wodack recently resigned as district manager for the Jas. Clark Jr., Electric Co., with which he has been affiliated for 12 years. A. K. Wodack is vice president of the new company and Albert T. Lochner is secretary and superintendent.

* * *

ERECTION of a new plant is under way for the Appleton Electric Co., Chicago, which when completed will provide 140,000 square feet of floor space. The building will be four stories and basement, and will cover an area of 45,000 square feet. When completed, modern equipment will be installed and it is expected the improvement will enable the company to greatly increase its production of conduit fittings. A power house will be erected as a separate unit of the plant. Officers of the company are: President, A. I. Appleton; vice president, F. H. Merrill, and secretary, J. V. Painter.

* * *

ALUMINUM vibrator plates and castings are to be manufactured by the Springfield Aluminum Plate & Casting Co., Springfield, O., recently organized. Those interested include William Jordan, E. A. Parker and Frank Hook, all formerly affiliated with the American Seeding Machine Co. Mr. Jordan was assistant to the foundry manager; Mr. Parker was foreman in the pattern and experimental department and Mr. Hook was head of the vibrator plate production department. Quarters for the new company have been established in the Duplex building, Springfield, but the construction of a new plant is contemplated at an early date.

* * *

ALTHOUGH the old American & British Mfg. Co., Providence, R. I., and Bridgeport, Conn., has voted to dissolve, the business will be continued under a reorganization plan under the name of the American & British Mfg. Corp. The new corporation makes guns, ammunition, steam and oil engines, automobile and marine motors and operates the former plant of the Corliss Steam Engine Works, Providence, and the American Ordnance works, Bridgeport. The old company went into the hands of a receiver five or six years ago but continued the business until recently when a reorganization was effected whereby the American & British Securities Co. succeeded the International Power Co. as the holding company.

* * *

PRESENT plant capacity of the Herschell-Spillman Motor Co., North Tonawanda, N. Y., of 45 4-cylinder motors per day is being increased to 100. Equipment and buildings also will be provided for an additional production of 100 6-cylinder engines per day. For this purpose a 4-story building of reinforced concrete and brick construction is being erected. It will be 70 x 160 feet and the J. W. Cowper Co., Buffalo, expects to have it completed by Dec. 15. It is stated that orders for approximately $500,000 worth of machinery, machine tools and equipment are being released for early delivery. The engines are supplied to passenger car and truck manufacturers.

* * *

CAHILL & DOUGLAS, consulting electric engineers and steam generating plant contractors, Gross building, Milwaukee, have started work on a large number of power plant improvement and enlargement jobs in Milwaukee and other Wisconsin cities. The various projects are: Briggs & Stratton Co., Milwaukee, 100 per cent increase in steam generating equipment; Mueller & Sons Box Co., Milwaukee, new prime mover and general electrification of plant; Port Washington, Wis., $35,000 addition to municipal plant; Nunn, Bush & Weldon Shoe Co., Milwaukee, future generating capacity; Koehring Machine Co., Milwaukee, power plant enlargement; Racine Auto Tire Co., Racine, Wis., steam heating plant enlargement and new steel stack; Phoenix Chair Co., Sheboygan, Wis., additional 100-horsepower, direct current unit; Chicago, Racine & Milwaukee Line, Milwaukee, remodeling of boiler plant and steam heating transmission system; Isaac Barnett Woolen Mills, Milwaukee, extension of boiler plant and dye house.

Live Information Which Records the Expansion of Various Lines of Productive Enterprise

ERECTION of a foundry, 100 x 200 feet, to be devoted to the manufacture of gray iron, is planned by the Haywood Foundry Co., Indianapolis, to be organized shortly. The building will be of brick and steel construction and will be equipped modernly, with traveling crane and monorail delivery of material from the cupola to the side bays. Provision will be made for the installation of two cupolas, but only one will be put in. The personnel of the organization will consist of the stockholders of the Haywood Tire & Equipment Co., Indianapolis.

* * *

THE Aetna Steel Castings Co., Cleveland, has advised that it has increased its capital stock in order to finance the purchase and equipping of a plant at Lorain, O. The company plans to install a 5-ton open-hearth furnace in the Lorain plant, which it is expected; will be ready for occupation about Feb. 1. The Lorain plant will take care of the overflow business of the company's main plant at Cleveland.

* * *

IN ORDER to care for its rapidly increasing business the Youngstown Boiler & Tank Co., Youngstown, O., recently increased its capital from $50,000 to $100,000. Although the company plans the erection of additional buildings which will triple the size of its plant, according to J. P. Keene, president, it is not in the market for additional equipment as all has been contracted for.

* * *

THE Raymond Engineering Corp., Puck building, 309 Lafayette street, New York City, manufacturer of typewriters, photograph motors, power tire pumps, automobile and tractor parts, etc., has purchased a 15-acre site at Farmingdale, L. I. Work will commence immediately on the first two units of a $500,000 plant and these will be followed by other units next summer. The company recently closed contracts aggregating in excess of $2,500,000.

* * *

WESTINGHOUSE, CHURCH, KERR & CO., New York, have begun construction of a portion of the plant to comprise a new gray iron foundry and other buildings for the George D. Roper Co., Rockford, Ill., which took over the plant of the Eclipse Gas Stove Co. Westinghouse, Church, Kerr & Co. are constructing also a new electric steel foundry for Pettibone, Mulliken Co., Chicago.

* * *

THE Forbes-Perkins Co. has been organized with a capital of $1,500,000 to engage in foreign trade. The home office of the company is at 84 State street, Boston. A branch house has been opened at 120 Liberty street, New York. Members of the firm are W. Cameron Forbes, Charles E. Perkins and John F. Perkins. The New York office will be under the management of Rodney D. Chipp, now general manager of the Vulcan Tradings Co.

* * *

THE Superior Steel Castings Co., Benton Harbor, Mich., contemplates erection of a malleable iron unit to its steel foundry. The main building will be 130 x 440 feet, with wings, 60 x 80 feet and 60 x 100 feet. Buildings and equipment will cost approximately $200,000. Construction work will be started at once and the building is expected to be ready for occupation about April 1. W. R. Gilmore, vice president and general manager, advises the company is in the market for equipment for this plant.

* * *

THE McClintic-Marshall Co., Pittsburgh, has purchased the Bole property consisting of 100 acres just east of the Leetsdale, Pa., station. Officials of the company state that no immediate use is to be made of the land and that the purchase was made solely for the purpose of being able to make extensions at its Leetsdale plant in case they are necessary. The property adjoins the site of the Leetsdale plant of the company. It is understood that the consideration of the sale was $300,000.

* * *

REAL estate, plant and machinery owned by the Knox Motors Co., Springfield, Mass., has been conveyed to the Militor Corp., New York, which will operate it for the making of motorcycles. Part of the premises are reserved for two years by the Knox Motors Co. to continue its own business there. The remainder of the plant will be used by the new owner. At the end of two years it will take over all the plant for its own use exclusively. The corporation also specializes in a four-wheel drive truck.

* * *

CAPITALIZED at $200,000, the Jackson Stove & Stamping Co., Jackson, Mich., recently was organized to manufacture oil heating and oil cooking stoves, steel ovens, baking ovens, etc., and has purchased the real estate, buildings and machinery of the Novelty Mfg. Co. and the Boeck Stove Co. The new concern expects to start operations Nov. 1. Officers of the company are: President, E. Barton Hall; vice president, B. M. Young; treasurer and general manager, W. V. Sherwood; secretary, Edgar Wells, and factory manager, Frank L. Hurd.

* * *

THE Kewaskum Aluminum Co., organized with $150,000 capital by local interests at Kewaskum, Wis., has elected the following officers: President, A. L. Rosenheimer; vice president, Dr. N. E. Hausmann; secretary, B. H. Rosenheimer; treasurer, A. L. Rosenheimer Jr. A 2½-acre site has been purchased for the new plant, the first unit of which, 60 x 200 feet, will be erected during the winter. Temporary quarters have been leased and are being equipped. Albert Hron, formerly with the West Bend Aluminum Co., West Bend, Wis., has been engaged as works manager.

* * *

ORGANIZED for the purpose of manufacturing woven wire fencing, steel fence posts, farm and lawn gates and fence weaving machinery, the Columbus Wire Fence Co., Columbus, O., contemplates the erection of a modern brick and steel factory building, 66 x 120 feet. It will require a milling machine and lathe among other equipment and three variable speed 5-horsepower motors. Its capital is $50,000 and S. G. Shaw is president and manager; G. W. Moore is secretary and treasurer. Present office and factory is located at 827 Reynolds avenue, Columbus.

October Exports Show Growth

Sterling Exchange Drops to New Low But Rebounds Later—Hope of Recovery to Par of European Exchanges Blocked by Three Strong Elements—Currencies Depreciated—General Financial News

BY JOHN W. HILL, FINANCIAL EDITOR

THE completely upset condition of the international trade and financial situation could not have been more forcibly emphasized than by the drop of the currency of the proud British empire to $3.99, or a discount of more than 18 per cent, which occurred last week. That sterling would go below $4 was predicted by eminent authorities last spring when the support was removed from the exchanges, and the climax came when the senate rejected the peace treaty.

Both the foreign exchanges and the stock market had been discounting the probable unfavorable action of the upper chamber of congress for some days. The most remarkable part of the whole transaction, however, was the fact that once the "bad news" was out, recovery began immediately and has continued since. The collapse of the exchanges had sent all European currencies to new low levels, and the rebound took them all up again, even including Germany. The rise has not been remarkable, however, and is not likely to become so soon for a number of outstanding reasons.

Treaty Defeat Reduces Credit Hopes

First, the defeat of the peace treaty has reduced to a minimum hopes that adequate credits may be arranged to permit Europe to meet the tremendous winter needs for food, clothing, and raw materials with which to start industries. Without the stabilizing basis for credits which the treaty would supply, comprehensive plans in this direction will be difficult of accomplishment. In addition the senate adjourned without having taken final action upon the Edge export financing bill. The upward move of exchange from the extreme low level, however, has been induced by the announcement that President Wilson is considering the advisability of summoning an international conference on the matter of European credits and foreign exchange. Ample credits of course would not be a permanent cure, but might correct the temporary situation and give Europeans an opportunity to regain industrial prosperity, in order to pay their debts when exchange is more favorable.

The next important factor working against the recovery of European exchanges resides in the enormous paper inflation existing abroad and the consequent vast depreciation of the currencies. It is estimated that Europe owes $290,000,000,000 in paper circulation and funded debts against which she has a gold reserve of $5,500,000,000 or little more than 2 per cent. From this it is plain that much of the solution of the problem of the bringing of European exchange up to par depends upon the vigor and effectiveness with which the nations attack the stupendous task of liquidating the debt of the war and deflating the extraordinary war debt. Without intensive work, supreme economy and enormous taxes, this will be impossible and little evidence has filtered across the Atlantic that Europe has begun the application of these remedies.

The third and probably the most important phase of the question is the great excess of exports over imports which the United States maintains. Until Europe can reduce purchases and boost sales to America exchange cannot recover. The excessive exchange premium has served to cut down exports to France and Italy, but even these countries cannot stop buying—their needs for food and fuel are too pressing. Neither is Europe increasing her exports to America rapidly, the $128,000,000 gain in imports in September represented a gain of only $23,000,000 from Europe.

That America is still the huge storehouse for the world, to which the rest of the nations must come for foods and supplies at whatever cost, for a time at least, is made apparent from the report of October foreign trade made public a few days ago. Exports at $631,910,972 were $320,000,000 over the same month of 1918 and $35,376,000 more than September. Exports however are almost $300,000,000 less than the June high mark. Imports were $415,665,676 against $246,764,906 for the same month one year ago, but $19,719,000 less than imports for September. The excess of exports for October were $216,245,296 against $161,150,000 for the previous month, which shows that the process of correcting the upset exchanges by reducing this country's excess of exports is having a rocky path.

The 10 months excess of exports shows a striking increase over last year, with $3,388 536,522 for the current year and the $2,491,646 683 for the corresponding months of last year.

The stock market after its recent sensational letdown following upon the advance of rediscount rates on government obligation collateral, apparently is now in a sounder position. Governor Harding of the federal reserve board in defending the board's action against critics who charged it with conniving with bear raiders declares that the board will not "sanction any policy which would require federal reserve banks to withhold credit demanded by commerce and industry for the processes of production and distribution in order to furnish cheap money for speculative purposes." The board not only has taken definite steps against the overextended stock market speculation but also is preparing to strike at the speculation in commodities, such as cotton, grain, etc., by preventing the employment of reserve bank credits for this purpose.

Hydraulic Pressed Steel to be Reorganized

President James H. Foster, of the Hydraulic Pressed Steel Co., Cleveland, has announced a plan, subject to the approval of the stockholders for the refinancing of the company and its subsidiaries upon a permanent basis for the purpose of taking care of increased business.

Under the plan the assets and liabilities of the Hydraulic Pressed Steel Co., Cleveland Welding & Mfg. Co., the Hydraulic Steel Craft Co., all of Cleveland, and the Canton Steel Sheet Co., of Canton, will be assumed by the new Hydraulic Steel Co., which will be incorporated. Under this arrangement holders of the common stock in the company will receive three shares of common stock of no par value in exchange for each share of common stock now owned.

To make possible the redemption of the $3,500,000 of notes and the outstanding preferred stock of the Hydraulic Pressed Steel and the Canton Sheet Steel Co., it is proposed to issue $6,000,000 of 7 per cent cumulative preferred stock and 200,000 shares of common stock of no par value. Proceeds from the sale of these stocks will be sufficient to retire the notes and also the two preferred stock issues and will give the

company ample additional working capital.

The preferred stock can be converted into common stock at any time between April 1, 1920, and April 1, 1921, at $45 a share and thereafter at $50 a share for the common stock. The common stock will be offered separately at $44 a share. The Hydraulic Steel Co. will have three plants in Cleveland and one in Canton comprising 123 acres of land, 60 acres of which are covered by buildings.

Replogle Steel Assets Are Put at $12,121,288

The assets of the newly organized Replogle Steel Co. total $12,121,288, including cash of $5,732,679, bills receivable of $233,571 and inventories of $1,111,267, according to a statement sent to the subscribers to 250,000 shares of stock of no par value of the new company. The assets given include the company's subsidiaries, the Wharton Steel Co. and the Wharton Northern railroad. The report shows the company owns blast furnaces with 1000 tons daily capacity and a concentrating mill of 2500 tons crude ore daily capacity, while total plant and equipment are valued at $4,236,001.

Mr. Replogle's letter is accompanied by a report of James Gayley, formerly vice president of the United States Steel Corp., showing that the Wharton property is fully assured of reserves of 100,000,000 tons of high grade ore. Mr. Gayley recommends the modernizing of two blast furnaces which should produce 30,000 tons of pig a month at a cost of $24.05 per ton. The cost is based on the present market value of 60 per cent ore, and coke at $8.50 a ton and should yield a net profit of $1,000,000 per annum on prices of pig iron prevailing in recent months. Mr. Gayley says the market value today of 60 per cent ore at Wharton, compared with Lake Superior ores, in Eastern markets is $7.80 per ton. He regards the company's estimate of profits of $4 per ton on the 450,000 tons per year as very conservative.

Steel Foundries Tax Less

For the year ended Sept. 30 the American Steel Foundries reports a surplus of $2,462,573 after charges and federal taxes, compared with a surplus of $2,606,723 for 1918. Net earnings before taxes in 1919 were $3,754,696 against $6,858,017 in 1918. A decrease of $2,700,000 in reserve for federal taxes this year to $1,243,113 is shown. The comparative income account follows:

	1919	1918
Net earnings	$3,731,696	$6,858,017
Depreciation	210,826	305,860
Balance	$3,540,870	$6,552,157
Other income	330,118	142,063
Total income	$3,870,988	$6,694,220
Charges	*165,302	117,497
Federal tax res.	1,243,113	3,970,000
Surplus	$2,462,573	$2,606,723

Fisher Ohio Body Elects

Fred J. Fisher, president of the Fisher Body Corp., Detroit, has been elected president of the Fisher Body Ohio Co., Cleveland. Charles F. Fisher has been chosen vice president of the company; — Mendelsohn treasurer and A. Mendelsohn secretary. Directors include E. F. Fisher and A. J. Fisher, of Detroit, and L. Fisher Sr., of Norwalk; Grovenor Hutchins, Hallgratten & Co., New York; John Sherwin and Joseph R. Kraus, the First National bank, Cleveland; Frank H. Ginn, member of the law firm of Tolles, Hoggsett, Ginn & Morley, Cleveland; Charles A. Otis, Richard Inglis and C. V. Crowther, of Otis & Co., and Norris J. Clarke, of the Lake Erie Bolt & Nut Co., all of Cleveland.

Buys Dominion Stock

Toronto, Ont., Nov. 25.—At a meeting of the board of the Dominion Steel Corp., at Montreal, it was decided that the Dominion Iron & Steel Co. would sell to a London syndicate 50,000 shares of common stock of the Dominion Steel Corp. at $70 per share. This is to be new stock to be acquired from the parent corporation.

President Mark Workman in making this announcement stated that the transaction was the culmination of plans which he had conceived when in England last spring with the object of extending the business by securing the co-operation of men influential in steel, coal and shipping circles. An advisory committee from the British Syndicate will be formed to cooperate with the Dominion Steel board in connection with British business, including such men as Viscount Furness, Sir William Beardmore, Sir Trevor Dawson, Sir Harry McGowan, Benjamin Talbot and Henry Steel, all of whom are outstanding figures in their respective

Lowered Supply

Shown in Various Coal Tar Products —Prices Are Firm

New York, Nov. 24.—The market on sulphate of ammonia continues strong, as supplies are increasingly difficult to obtain. Little contract business is being attempted, producers being well sold up over the next six or seven months and it is only on an occasional spot lot that buyers are attempting to figure. Spot domestic material may be quoted at $3.75 to $3.80; on futures prices are nominal. Export business, involving only spot sales, is small and is being done at $4.25 to $4.50, eastern seaboard. There is a good volume of export inquiry. Production is improving.

Coke Oven By-Products

Spot

Per Gallon at Producers' Plant

Pure benzol	$0.25 to .29
Toluol	.26 to .30
Solvent naphtha	.22 to .27

Per Pound at Producers' Plants

Phenol	nominal
Naphthalin, flake	0.06½ to .07½
Naphthalin, balls	0.08½ to .09½

Per 100 Pounds at Producers' Plants

Sulphate of ammonia	3.75 to 3.80

Contract

Pure benzol	$0.25 to .29
Toluol	.26 to .30
Solvent naphtha	.22 to .27

Per Pound at Producers' Plant

Phenol	nominal
Naphthalin, flake	0.06½ to .07½
Naphthalin, balls	0.08½ to .09½

Per 100 Pounds at Producers' Plants

Sulphate of ammonia	nominal

Naphthalin continues to move freely, although sales are falling off somewhat as the buying season for the drug trade comes to a close. The market still holds at 6½ to 7½ cents for flakes and 8½ to 9½ cents for balls. Phenol is in steady demand. The government price is 12 cents, f.o.b. eastern stores. Special grades of phenol are holding 3 and 4 cents higher.

No change has appeared on benzol though some interests are looking for an advance. Production largely is being applied on old contracts. As a result, little spot material is available. Contract business is not being offered freely. Pure benzol is quoted at 25 to 29 cents, and 90 per cent, 22 to 24 cents.

Toluol is unchanged at 26 to 30 cents. Demand remains steady and is not of large volume. Much the same can be said of solvent naphtha.

Tool Sellers Meet Active Demand

Some Buyers Who Cannot Wait for Deferred Deliveries Buy Used Equipment—Quickened Market is Noted in the East—Few Purchasers Await New Year Before Closing—Crane Demand is Limited

NOVEMBER'S closing week finds machine tool sellers in practically every district, busily engaged endeavoring to satisfy their customers' demands. Used machines find many takers among manufacturers who must have equipment and cannot wait for deferred deliveries. The approach of inventory-taking time and the condition of the labor market apparently are having but little effect upon the situation, although here and there a few companies state they will not buy until after Jan. 1.

In the East, a decided improvement in machine tool demand is in evidence. Three of the largest buyers are the American Car & Foundry Co., the General Electric Co., and the Otis Elevator Co. An unidentified list calls for $125,000 worth of miscellaneous equipment. If the Submarine Boat Co., Newark Terminal, N. J., obtains a certain contract, it will probably purchase additional equipment. The Palmer Electric Co., Cambridge, Mass., and the Greenville Steel Car Co., Greenville, Pa., both issued small lists.

In Pittsburgh, one item of importance is noted, namely the purchase of crane and hammer equipment by the Pittsburgh Knife & Forge Co., Coraopolis, Pa. Mill equipment will probably be bought by the Erie Crucible Steel Co., Erie, Pa., and the Atlas Crucible Steel Co., Dunkirk, N. Y.

Cleveland dealers are receiving numerous inquiries but like sellers elsewhere they report that requests mainly are for prices on one or two tools. The Jordan Motor Car Co., Cleveland, bought tool room equipment and soon will close on production machinery, dividing its business among several dealers. The Day Machinery Co., Buffalo, is endeavoring to locate eight machines. The Kent-Ownes Machine Co., Toledo, O., and the Carlton Machine Tool Co., Cincinnati, each have issued small lists. One inquiry at Cleveland of interest is for shipment to China, issued by the Yung Lee Soda Co., Ltd., Tang-Ku, Chili, China, and calls for three fair-sized tools with attachments.

While demand is undiminished in Chicago, buying is somewhat restricted. However, the Continental Machine Co., Chicago, Williams, White & Co., Moline, Ill., and the Ilg Electric Ventilating Co., Chicago, all made purchases. The Haskell & Barker Car Co., Michigan City, Ind., wants bending rolls for plates.

Canadian dealers are busy supplying present demand but expect their activity to increase after the first of the year, when many building projects now up will give attention to equipment needs. The Standard Equipment & Tool Works, Montreal, is in the market for four machines.

Cranes continue to move slowly in the United States, most of the current inquiries call for one or two. The Otis Elevator Co., bought one each for Harrison, N. J., and Quincy, Ill. One is to be purchased by the Standard Oil Co., for Toledo and the Concrete Steel Co., New York City, already has closed on two for Chicago. Prospective crane purchasers include the International Motors Co., New Brunswick, N. J., Westinghouse, Church, Kerr & Co., Sun Shipbuilding Co., Chester, Pa., and the Submarine Boat Co., Newark Terminal, N. J.

Machine Tools Active in East; Cranes Quiet

INCREASING activity is noted in the eastern machine tool market. Inquiries are coming out in better volume and buying is of a more substantial character. Among the larger buyers of the past week have been the American Car & Foundry Co., the General Electric Co., and the Otis Elevator Co. The purchases of the General Electric Co. now aggregate more than 100 machines, all for Schenectady, N. Y. A similar number still is to be bought. Business placed by the American Car & Foundry Co. includes a list of 10 or 12 fabricating tools. It is understood that there now is some question as to whether this company will buy at this time all of the equipment originally contemplated.

Although no exceptionally large lists were issued last week, several sizable inquiries came out, possibly the most notable of which involved about $125,000 worth of miscellaneous machines. The Submarine Boat Co., Newark Terminal, N. J., is contemplating the issuance of a large list of equipment, contingent, it is said, upon the receipt of a shipbuilding contract upon which it now is figuring. The Palmer Electric Co., Cambridge, Mass., is inquiring for a small list of tools. The Western Maryland railroad is in the market for several machines, including a small lathe and a grinder, for a repair shop. Some equipment is to be purchased by the Greenville Steel Car Co., Greenville, Pa., for a machine shop addition.

Although several sizable inquiries are pending, trading in the eastern crane market during the past week has been light, only a few scattered contracts being reported. One contract awarded is that placed by the Otis Elevator Co. with the Bedford Foundry & Machine Co., involving two 5-ton overhead cranes. One will have a span of 48 feet and will go to Harrison, N. J., and the other is to have a span of 50 feet and is to go to Quincy, Ill. The.

14-inch Mills at Work in the Ludlum Plant

ESTABLISHED LUDLUM 1854

The Great Demand

for LUDLUM HIGH SPEED STEEL has kept our mills constantly on-the-go.

The mills shown above are our 14-inch mills used for reducing LUDLUM TOOL STEEL to a size suitable for rerolling. This is but one of the many operations which Ludlum Steel must undergo before it becomes *consistently* uniform.

Constant operation has enabled us to pile up a reserve from which we can ship you promptly your requirements.

Shipments from warehouse stock at Watervliet, N. Y.; Detroit, Mich.; Chicago, Ill.; or Cambridge, Mass., handled thru our Branch Offices.

Standard Oil Co. is to close shortly on a 2½-ton grab-bucket crane with 20-foot span and 90-foot lift, for a power plant at Toledo, O. The Concrete Steel Co., 42 Broadway, New York City, is reported to have placed one each 10 and 7½-ton electric cranes with the Whiting Foundry & Equipment Co. for shipment to Chicago. Follansbee Bros. have bought a number of cranes for their plant at Follansbee, W. Va. The Pawling & Harnischfeger Co., Milwaukee, was awarded the smaller cranes and an Alliance, O., manufacturer is reported to have received the remainder.

The International Motors Co., New Brunswick, N. J., is in the market for a 5-ton overhead crane. Westinghouse, Church, Kerr & Co., 37 Wall street, New York City, are expected to be in the market soon for electric cranes for a fertilizer plant in Baltimore for Armour & Co. The report appearing in last week's issue that the Sun Shipbuilding Co., Chester, Pa., was in the market for approximately 12 cranes was in error. The Sun company had inquired for five 15-ton overhead cranes, one to have a span of 78½ feet and the remaining four to have spans of 115 feet. It is understood now, however, that the company is considering a revisal of its list. Some interest is being manifested by the trade at this time in the future plans of the Submarine Boat Co., Newark Terminal, N. J., which has just recently decided to build 9900-ton vessels. The company has been building 5500-ton ships for the shipping board, and although a number were canceled a short time ago, the company, nevertheless, plans to finish these also.

An interesting development in the locomotive crane market is the sale of late of several locomotive cranes at Hog island, Philadelphia, by the government. Further cranes are to be disposed of, it is stated. Inquiries are said to be fairly numerous for new equipment of this type; nevertheless few awards are being reported at this time.

Buying Postponed Until January

WHILE the market for machine tools continues active in the Chicago district, some indication is being met that the approach of inventory season is restricting buying. The effect of this position is not apparent in any diminution of demand, but some prospective buyers have said they would delay placing further orders until after the first of the year. This has affected some business already pending. The Nash Motors Co., Milwaukee, is preparing a list of production equipment which may be placed before long. The Continental Machine Co., 2002 Clybourn avenue, Chicago, is a manufacturing concern just formed for the manufacture of special machinery and general machine work, and has placed its equipment orders. Fairbanks, Morse & Co. is building additions to its plant at Beloit, Wis., for which it will require additional equipment. Williams, White & Co., Moline, Ill., builder of machine tools, has placed orders for considerable additions to its planer equipment. The Ilg Electric Ventilating Co. has begun to buy equipment for the new plant it is building at Chicago. The Samson Tractor Co., at Janesville, Wis., has ceased buying for the present, but is expected to place further orders later. Railroads still hesitate about placing business, and the inquiry recently revived by the Burlington road is now definitely put over until after the beginning of next year.

Unusual demand for tank cars is bringing out inquiry from carbuilders for machinery, especially adapted to this purpose. The Haskell & Barker Car Co., Michigan City, Ind., is inquiring for an especially heavy set of bending rolls for plate work. Presses of all kinds are scarce and difficult to buy. Strong demand is being met for radial drills, which move actively.

The Excel Motor Truck Co. has been organized to build motor trucks and tractors and has bought a site in Chicago on which it will build a plant at once. The city of Chicago is building a new pumping station in the southwest part of the city and will require pumping machinery, running to several million dollars. The Chicago Electric Mfg. Co., Chicago, is building a factory, for which it will require equipment.

Pittsburgh Knife & Forge Buys Equipment

THE Pittsburgh Knife & Forge Co. has just closed for a crane with the Toledo Bridge & Crane Co., Toledo, O., for its new forge plant at Coraopolis, Pa., and with the Chambersburg Engineering Co., Chambersburg, Pa., for seven steam drop hammers. Otherwise, no important business has been done recently in the Pittsburgh district in machinery and tools. The volume of inquiries, however, keeps up and with the coal strike adjusted, a number of orders are likely to be closed shortly.

The Pennsylvania railroad, lines west, has put out an inquiry for two large presses for its new car shops at Stark, O., and the Erie Crucible Steel Co., Erie, Pa., is understood to be contemplating the installation of a new 10-inch mill, while the Atlas Crucible Steel Co., Dunkirk, N. Y., is considering adding a 20-inch mill. Prosperity in the forge industry is reflected in an active demand for drop hammers and second hand ones are being sought since delivery of new hammers cannot be made promptly.

Makers of machine tools are pretty heavily booked and on the lighter lines are not promising deliveries short of eight weeks while on some of the heavier machines six and seven months are the dates. Makers of rolling mill equipment also are well sold ahead and not inclined to quote on business calling for early deliveries.

All Cleveland Machinery Sellers Busy

LITTLE effect so far has been noticed by Cleveland machine tool and equipment sellers of the approach of inventory-taking time. Some buyers have signified their intention to hold back orders until after the first of the year but these are few comparatively and almost everybody wants new equipment as soon as it can be delivered to them. Many buyers are in urgent need of equipment and these are filling their requirements from used machinery offerings. Deliveries on new equipment stretch from two to six months, many makers offering April, 1920, as the earliest possible date. This has sent machinery dealers into the open market in an effort to fill their customers' wants. One of the largest inquiries from dealers current in Cleveland, has been issued by the Day Machinery Co., Buffalo, for eight machines, namely, three shell-boring lathes, 24-inch swing, 12-foot bed; two 6-spindle sensitive drill presses; one 12-inch gear hobber; one 6-inch Gleason bevel gear planer and one 12-inch Heald or Walker rotary surface grinder. Used machines in good condition will be taken.

Sizable lists are lacking. However, one is expected soon from the Jordan Motor Car Co., Cleveland, which, it is stated, is to become a manufacturing instead of an assembling proposition. It recently purchased tool room equipment comprising one each lathe, drill, milling machine, broaching machine, grinder, etc., and now is receiving quotations on multiple spindle drills and other equipment. Additional equipment is being bought by the

FARRELL-CHEEK
STEEL
CASTINGS
Physically
Perfect
FARRELL-CHEEK STEEL FDY. CO.
Makers of Steel Castings that are a little better than the next best.
SANDUSKY, OHIO, U. S. A.

Dayton Pneumatic Tool Co., Dayton, O., and the Progressive Tool & Engine Co., that city. Punch presses, etc., are being purchased by the Educational Toy Mfg. Co., Dayton, while automatics and other equipment are to be closed upon soon by the Dayton Computing Scale Co., that city. The S. H. Thompson Co., Fourth and St. Clair streets, Dayton, recently closed on a No. 4 milling machine and some other machinery but now is increasing its facilities to manufacture fire extinguishers and automobile starters. The B. F. Goodrich Co., Akron, O., is receiving revised quotations on some equipment, including one 36-inch x 18-foot engine lathe. The Apex Motor Co., Ypsilanti, Mich., is in the market for machinery for a new truck plant.

Small inquiries for one or two tools continue numerous, one dealer expressing himself as being "snowed under." This condition at this season of the year is unprecedented and in view of prevailing labor unrest in practically all lines of activity, is all the more strange. The Steiner Bros. Co., Lima, O., wants one centering machine. The Cleveland Graphite Bronze Co., Cleveland, is understood to be in the market for a 15-ton press and a Rockford drill press. Kraeuter & Co., Inc., Newark, N. J., are endeavoring to locate a Bradley upright helve hammer, 200 to 300-pound capacity. The Borden Co., Warren, O., wants a surface grinder, and the Carlton Machine Tool Co., Cincinnati, is taking quotations on No. 0 Giddings & Lewis No. 3 and No. 3-A and No. 33 Lucas horizontal boring mills; No. 2, 3 and 4 Lapointe broaching machines and 14-inch x 6-foot Lodge & Shipley lathes. The Kent-Owens Machine Co., Toledo, O., is in the market for equipment to increase its facilities. The Richarde Motor Co., Cleveland, which went into the hands of a receiver some time ago, again is taking up the manufacture of automobiles and is understood to be in the market for some equipment. It recently purchased a large Kempsmith maxi-miller.

One of the interesting inquiries to reach Cleveland, calls for machinery to be shipped to China. Miller & James, engineers and architects, 604 Bangor building, Cleveland, are receiving quotations for T. Y. Chen of the Yung Lee Soda Co., Ltd., Tang-Ku, Chili, Republic of China, on the following equipment: One new 84-inch Bickford vertical boring mill; one new 7-foot Lynd-Farquhar wall type radial drill for 7/8-inch holes with one new Jarvis tapper, 5/8-inch capacity to fit it and one new 16-inch x 6-foot Cincinnati engine lathe, with taper attachment and double back gear.

The Jones Gear Co., Cleveland, which bought equipment about a month ago, has announced its intention to double its capacity. This will doubtless mean additional orders for machinery. The Ohio Body & Blower Co., Cleveland, formerly the Ohio Blower Co., is preparing an expansion program. The Automotive Corp., Spitzer building, Toledo, O., is erecting the first of six units of a new plant and so far as is known, has not closed on its equipment requirements. Plant additions are contemplated by the Commerce Motor Car Co., Detroit, and the Hackett Motor Car Co., Grand Rapids, Mich. Contracts already have been placed for a 4-story plant by the Von Briggle Motor Device Co., Indianapolis, and the Kalamazoo Railway Supply Co., Kalamazoo, Mich., is to manufacture a gasoline motor car and will erect a plant addition, 100 x 310 feet. Machinery for the coffee industry is to be manufactured by the John A. Reynolds Co., Inc., 403 Greenwood avenue, Detroit, recently incorporated at $1,000,000. Half of the $500,000 expansion program of the Nichols & Shepard Co., Battle Creek, Mich., has been completed.

Canadian Activity Continues Unabated

ACTIVITY in the Canadian new and used machinery and machine tool market continues unabated. Dealers are unable to promise delivery of new equipment in most lines inside of four to six months and as fast as second-hand machinery can be rebuilt it is picked up by those who are unable to wait. Many Canadian concerns are building additions to their plants, while others are erecting new plants or contemplate doing so. Several of these will place lists after Jan. 1.

The H. A. Wood Mfg. Co., Royal bank building, Toronto, is in the market for brass working machinery and equipment for the manufacture of auto valves at Belleville, Ont. W. A. Kribs, Hespeler, Ont., is in the market for a No. 1 Farwell gear hobber, or its equivalent. The Standard Equipment & Tool Works, 179 St. James street, Montreal, is in the market for a universal milling machine, equivalent to No. 1 or No. 2; also planer, shaper and bolt cutter. Acton, Ont., will be in the market shortly for machinery and equipment for waterworks plant. J. Alpaugh & Son, Fergus, Ont., are in the market for stoneworking machinery. The Canadian Woodenware Co., St. Thomas, Ont., will purchase equipment for an addition to its factory. The Adelaide Oil Co., Adelaide, Ont., is in the market for oil drilling equipment. The Dominion Glass Co., Redcliff, Alta., is building a plant addition and will install machinery to cost $90,000.

Construction and Equipment

Concise and Timely Business Building Opportunities from the Field of Industry

Among New England Plants

BANGOR, ME.—The Penobscot Foundry Co. will erect a machine shop, 2-stories, 50 x 100 feet, in the spring.

BELFAST, ME.—The Penobscot Bay Electric Co. will install a water gas plant to replace the present gas plant at a cost of $25,000.

BIDDEFORD, ME.—The Saco Lowell Works has had plans drawn for a foundry.

PORTLAND, ME.—The N. D. Cobb Co., Inc., has been incorporated to build boats and marine hardware with $100,000 capital, by M. D. Cobb, V. M. Cobb and Harry L. Cram.

BURLINGTON, VT.—The warehouse of the Vermont Hardware Co. recently was damaged by fire.

BOSTON.—The M. Fred Hirsch Co. has been incorporated to make silverware with $6000 capital, by H. V. Foulke and A. C. Smith.

BOSTON.—The Calef Gas Burner Co. has been in-

corporated with $5000 capital by Michael L. Fahey, M. C. Greeley and E. B. Calef.

BOSTON.—The Electrol Co. has been incorporated to make storage batteries with $100,000 capital, by Charles Farrow, S. B. Condit Jr. and Robert Cushman.

BOSTON.—The Roto Oil Burner Co. has been incorporated with $75,000 capital, by F. D. Minyard, Frank G. Watrous, Brookline, Mass., and C. L. Simmons.

CAMBRIDGE, MASS.—Charles N. James has let the contract for a 1-story, 100 x 125-foot plant for the manufacture of automobile wheels, to cost $40,000.

EAST SPRINGFIELD, MASS.—The New England Westinghouse Co. has let the contract for a 1-story, 110 x 250-foot building.

HOLYOKE, MASS.—George W. Prentiss & Co., makers of wire, have let the contract for a 3-story addition to the former plant of the G. Haarmann & Co., Inc., to cost $50,000, a 60 x 100-foot storage building and a 30 x 48-foot acid building.

LUDLOW, MASS.—The Ludlow Mfg. Co. will build a 2-story addition to its present machine shop.

LYNN, MASS.—The Sampson Axcess System, Inc., has been incorporated to make machines with $500,000 capital, by A. T. Sampson, J. M. Cotter and A. G. Wadleigh.

MALDEN, MASS.—The Union Spring Mfg. Co., Inc., recently was incorporated with $10,000 capital, by Abraham Blatt, David Yessin and Abraham S. Goldman.

NATICK, MASS.—The Northway Motor Co. will build a 3-story, 70 x 500-foot building.

EAST CAMBRIDGE, MASS.—The National Casket Co. contemplates a boiler house addition, to cost $12,000.

ORANGE, MASS.—The O. J. Howe Treeing Machine Co. has been incorporated with $50,000 capital, by R. C. Evarts, F. G. Mahoney and S. C. Woodworth.

PALMER, MASS.—The Otis Co. will erect a machine shop here in connection with its mill.

SOMERVILLE, MASS.—The Boston Pen Co. recently was incorporated with $5000 capital, by Charles Brant, C. E. Brant and Thomas P. Miller.

SPRINGFIELD, MASS.—Bids have closed for a storehouse for bar stock at the United States arsenal.

SPRINGFIELD, MASS.—The Smith-Springfield Body Co. will build a plant for the manufacture of metal automobile bodies.

WORCESTER, MASS.—The American Steel & Wire Co. plans an addition, two stories, 14 x 40 feet.

WORCESTER, MASS.—The Worcester Press Steel Co. has started work on an addition to be 90 x 150 feet.

WORCESTER, MASS.—The Worcester Lathe Co. is moving its plant to the buildings of the A. H. Steele Co.

WORCESTER, MASS.—The construction of a new building will be started soon to house the C. J. V. Critchley Mfg. Co., the Park Mfg. Co. and a Boston manufacturer, name not yet made known. All concerns manufacture automobile parts.

ANSONIA, CONN.—The Dew-Tone Co., Inc., has been incorporated to make attachments and needles with $25,000 capital by F. T. Terry, A. C. Turner and L. F. Anschutz.

BRIDGEPORT, CONN.—The Singer Mfg. Co. has let the contract for a 1-story, 61 x 23-foot forge shop, a 12 x 25-foot pump house and an oil tank.

BRIDGEPORT, CONN.—The Bridgeport Worm & Gear Mfg. Co. has been incorporated with $100,000 capital by J. N. Bayus, Stratford, Conn., Leonardo Mainiero, John Hissich, Stephen Erhardt, Andrew Demosko, Peter Hibjan and Joseph M. Ondek.

EAST BERLIN, CONN.—The Connecticut Metal & Chemical Co. has let the contract for a 1-story, 120 x 300-foot building.

HARTFORD, CONN.—Plans are being prepared for a plant, 5 stories, 50 x 310 feet, with a wing, 50 x 63 feet, for the Royal Typewriter Co., to cost $200,000.

NEW HAVEN, CONN.—The New Haven Machine Co. has awarded a contract for a plant.

NEW HAVEN, CONN.—The Kelly Tire & Rubber Co., 262 Chapel street, is having plans drawn for a factory and power house, 1-story, 75 x 200 feet, and 1-story, 25 x 260 feet, to cost $500,000.

WINDSOR, CONN.—The General Electric Co. will build a factory of about 40,000 square feet to cost $75,000, exclusive of machinery and equipment.

North Atlantic States

BROOKLYN, N. Y.—The Lehruod Metal Bed Corp. recently was incorporated with $8000 capital, by B. Gurian, A. Levine and H. Rodstein, 1769 Park place.

BROOKLYN, N. Y.—The Vernon Automobile & Welding Works has been incorporated with $10,000 capital, by A. Adams, B. Komarow and D. Price, 372 East Tenth street.

BINGHAMTON, N. Y.—The Kroehler Mfg. Co. has had plans drawn for a power house, 1-story, 34 x 100 feet.

CHEEKTOWAGA, N. Y.—The Buffalo Steel Car Co. recently was incorporated with $80,000 active capital, by J. C. Bradley, J. G. Dudley and R. H. Parks.

DUNKIRK, N. Y.—The Continental Heater Works will build an addition to its plant.

ENDICOTT CITY, N. Y.—The International Time Recording Co. contemplates a plant addition.

LOCKPORT, N. Y.—The Dittmer Gear & Mfg. Corp. recently was incorporated with $71,500 active capital, by E. O. and A. H. Dittmer and G. W. Riley.

NEW ROCHELLE, N. Y.—The Crescent Washing Machine Co. has been incorporated with $500,000 capital, by T. D. Verseles, H. E. Verseles and I. L. Inglehard.

NEW YORK.—The Republic Auto Radiator Co. has been incorporated with $10,000 capital, by A. Krisch, A. Kriegel and S. Kamiel, 689 Wales avenue.

NEW YORK.—The Amalgamated Automotive Factories, Inc., has been incorporated with $20,000 capital, by H. Bobker, N. and M. Simmons, 309 West Ninety-ninth street.

NEW YORK.—Rolls-Royce of America, Inc., 15 Broad street, has selected Springfield, Mass., for its new plant.

NEW YORK.—The Standard Spring Motor Co. has purchased a 4-story building at 239 East 127 street, which it will alter for its own occupancy.

NEW YORK.—The Red Head Spark Plug Corp. recently increased its capital from $80,000 to $100,000.

NEW YORK.—The Robert-Irwin Mfg. Co., auto pumps, recently was incorporated with $30,000 capital, by I. and A. Berkowitz and M. Rappaport, 177 Wooster street.

NEW YORK.—Holgan Bros., Inc., machine and repair shops, has been incorporated with $10,000 capital, by P. Balantine, J. E. and P. H. Holgan, 11 Baxter street.

NEW YORK.—The American Galco, Inc., machinery and tools, has been incorporated with $100,000 capital, by H. Carlson, J. Hellstrom and G. H. Kline, 8 West Fortieth street.

NEW YORK.—The Schramm & Bursch Mfg. Co., Inc., recently was incorporated with $100,000 capital, to manufacture metal products, by M. Padtry, D. M. Freedman and C. N. Kaplan, 233 Broadway.

NEW YORK.—The Sterling Car Body Corp. has been incorporated with $50,000 capital, by S. W. Woodruff, D. H. Fessenden and C. E. Lussenhop, 153 Madison avenue.

NEW YORK.—The Electrical Copying Machine Corp. recently was incorporated with $25,000 capital, by H. Steingard, J. Baum and A. A. Walter, 120 Broadway.

NEW YORK.—The All Metal Lighting Fixture Corp. has been incorporated with $20,000 capital, by M. Berkowitz, S. and W. Splesinger, 2043 Washington avenue.

NEW YORK.—The National Safety Razor Corp. recently was incorporated with $15,000 active capital, by W. Dubilier, C. Marshall and E. A. Gersbach, 5 Beekman street.

NEW YORK.—The General Carbonic Co. has awarded a contract to the Austin Co., Cleveland, for a plant, 100 x 200 feet, a boiler house, 40 x 40 feet, and miscellaneous small buildings.

NEW YORK.—Contracts have been awarded to the H. D. Best Co., 949 Broadway, for an addition to the plant of the American Machine & Foundry Co. of Brooklyn. The proposed building will be 5-stories, 100 x 192 feet, with an ell of 30 x 40 feet.

ROCHESTER, N. Y.—The Bastian Bros. Co., Clinton avenue, will build a power house.

ROCHESTER, N. Y.—The John Anstice Co., Inc., will build a foundry, 145 x 216 feet.

ROCHESTER, N. Y.—The Rochester Railway & Light Co. has increased its capital stock from $17,250,000 to $18,250,000.

ROCHESTER, N. Y.—The Eastman Kodak Co., 343 State street, contemplates a plant addition, 5-stories, 60 x 90 feet, to cost $80,000.

ROCHESTER, N. Y.—The Kellogg Mfg. Co. has had plans drawn for a machine shop, 1-story, 200 x 800 feet, to cost $200,000.

ROCHESTER, N. Y.—The Multipost Co., 69 Allen street, has awarded a contract for a plant, 2-stories, 30 x 58 feet, to cost $50,000.

UTICA, N. Y.—The Lewis & Weller Mfg. Co. is drawing plans for a plant addition, 2-stories, 39 x 101 feet, to cost $15,000.

CHESTER, PA.—Enlargement of the Tindel-Morris Co.'s steel plant at Eddystone is contemplated. The company plans to increase its capital from $1,500,000 to $5,000,000 in order to care for the expansion.

ERIE, PA.—Plans have been completed by the Lakeside Forge Co. for an addition to its forge shop, which will be equipped with 12 hammers.

FRANKLIN, PA.—A charter has been granted the Empire Oil & Grease Co. which plans to erect a large plant. The company, which is capitalized at $50,000, was incorporated by A. R. St. Clair, C. H. Mattern and A. L. Confer.

HAZLETON, PA.—The Hazleton Tin Mfg. Co. will start operations here for the manufacture of tinware, copper and galvanized iron specialties.

PHILADELPHIA.—A $10,000 addition will be erected at the wagon plant of Adam Frederick.

PHILADELPHIA.—The Standard Tinfoil Co. is erecting a building, 130 x 260 feet, to be used for rolling mill purposes. The Austin Co., Cleveland, is in charge of the project.

PITTSBURGH.—The Pittsburgh Valve Foundry & Construction Co. will build a shop to cost $60,000.

PITTSBURGH.—The Gearless Motor Corp. will build a testing station.

PITTSBURGH.—The Federal Spring Co. has been incorporated with a capital of $5000 by R. T. Rossell, E. C. McHugh, L. R. Martin, C. J. Nicklas and E. J. Young, Pittsburgh.

PITTSBURGH.—The Fort Pitt Die & Mfg. Co. has been incorporated with $5000 capital by C. O. Henry, C. H. Sallada, J. A. Cullison and W. M. Lea, Pittsburgh.

BAYONNE, N. J.—The Bell Electric Engineering Co., 970 Broadway, recently was incorporated with $25,000 capital.

BLOOMFIELD, N. J.—The H. J. Moehler Motor Corp. has awarded contracts for a plant, to cost $80,000.

CAMDEN, N. J.—The Public Service Electric Co. and the Delaware Ship & Repair Co. were recently damaged by fire to the extent of nearly $100,000.

GARWOOD, N. J.—The C. & C. Electric & Mfg. Co. has purchased the business of the Burke Electric

Co., Erie, Pa., and is now engaged in moving its equipment to that city.

HARRISON, N. J.—A 2-story factory, 50 x 100 feet, will be erected here by the Vant Woud Rubber Co.

HOBOKEN, N. J.—The Atlas Railway Signal Co., 88 River street, recently was incorporated to manufacture railway signals with $200,000 capital.

IRVINGTON, N. J.—The Die Casting Co. has awarded contracts for a plant addition, to cost $15,000.

NEWARK, N. J.—A $45,000 factory building, 2-stories, 50 x 100 feet, will be erected here by Blanchard & Co., manufacturers of jewelry.

, NEWARK, N. J.—The Terminal Pattern & Model Works has awarded contracts for a plant addition.

NEWARK, N. J.—The Cellulose Products Corp., 187 Magazine street, will erect a 1-story workshop.

NEWARK, N. J.—The Donner & Smith Chemical Co. have purchased property for the purpose of extending its plant on Mulberry street.

NEWARK, N. J.—Diamond Electric Specialties Co. has been chartered with $100,000 capital by William Abramson, Frank Evans and F. Klang.

NEWARK, N. J.—Katzenbach & Stephens, 56 Bigelow street, will erect a boiler and engine house to cost $38,750.

NEWARK, N. J.—Roth & Co., Plane street, will erect a 2-story storage and heating plant, 60 x 150 feet and an office building at an estimated cost of $100,000.

NEWARK, N. J.—The American Writing Machine Co. has purchased the plant of the Jewell Tea Co. The property covers 50,000 square feet. The company will remove its factory to the site.

NEWARK, N. J.—A 71 x 80-foot power house will be erected here by P. Ballantine & Sons. Plans provide for the installation of four 500-horsepower boilers and additional space for four similar power units.

NEW ROCHELLE, N. Y.—The Crescent Washing Machine Co. has been incorporated with $500,000 capital, by T. F. and H. E. Merseles and F. L. Holt, 165 Broadway.

TRENTON, N. J.—The Hoblim Tool Mfg. Co., New York, has purchased the plant of the Trenton Bay & Burlap Co., and will equip the same for manufacturing purposes.

WALLINGTON, N. J.—The Mexican Petroleum Corp., 120 Broadway, New York, is reported planning a pump and boiler house here, to be 1-story, 33 x 68 feet.

BALTIMORE.—The Union Shipbuilding Co. will build additions to its plant.

HAGERSTOWN, MD.—The Modern Mfg. Corp., Bridgeport, Pa., has purchased the property of the Pacific Coast Stamping Co., a California corporation, with a capital of $400,000.

Central States Activity

ANTIGO, WIS.—The Antigo Tractor Co. has perfected its organization and will erect a machine shop and assembling plant, at a cost of $150,000.

FT. ATKINSON, WIS.—The James Mfg. Co. has increased its capital from $500,000 to $10,000,000. The company recently awarded contracts for plant additions, including a machine shop and foundry to cost $500,000.

KIEL, WIS.—Stoelting Bros., manufacturers of steel barn equipment, will build a machine and sheet metal working shop, at an estimated cost of $25,000.

MENASHA, WIS.—Ground has been broken for a new plant for the Whitmore Machinery & Foundry Co. The plant will be 60 x 116 feet. It will be equipped with a traveling crane.

MENOMINEE, WIS.—Work on an addition to the Litnum Bronze Co., ground for which was broken recently, is progressing.

MILWAUKEE.—The Auto Truck Service Co., 946 Third street, is contemplating a new plant. Theodore Hollnagel is president. The capital will be increased.

MILWAUKEE.—Fairbanks, Morse & Co. are reported contemplating a foundry, 550 x 990 feet, to cost $1,500,000.

MILWAUKEE.—The Chas. Abresch Co., Fourth and Poplar streets, machinist, has increased its capital from $250,000 to $350,000 and will enlarge its plant.

MILWAUKEE.—The Flexible Coupling Co. recently was incorporated with $25,000 capital, by S. R. Sette, Henry H. Otjen and James T. Drought. The company will manufacture metal goods.

MILWAUKEE.—The Milwaukee Reliance Boiler Works, 1102 Thirty-second street, has awarded contracts for an assembling shop, 1-story, 40 x 80 feet, to cost $12,000.

MILWAUKEE.—The capital stock of the Briggs & Stratton Co., 1047 Louis avenue, has been increased from $250,000 to $1,700,000, and the firm plans additions in addition to those now under construction, are contemplated.

MILWAUKEE.—Articles of incorporation have been filed by the Standard Sheet Metal Works. The company is capitalized at $10,000 and the incorporators are Henry Bloedow, Jacob Schaffner and John G. Mattee.

MONROE, WIS.—The Monroe Electric Co. will build a power plant addition. L. A. Turner is general manager.

RICE LAKE, WIS.—The New Idea Potato Machinery Co. has purchased the former Automatic Trip Carriers factory building and is moving into it.

SOUTH MILWAUKEE, WIS.—The Universal Aniline Dyes & Chemical Co. has let contracts for a new plant, 2-stories, 50 x 110 feet, to cost $75,000.

ALMONT, MICH.—The Almont Mfg. Co. has been incorporated with $25,000 capital, and has taken over the Almont Foundry, for the production of light gray iron semisteel castings. Charles D. Ferguson is president.

BATTLE CREEK, MICH.—The Union Steam Pump Co. is expending $200,000 for new buildings and equipment. Extensions include a machine shop and foundry.

BAY CITY, MICH.—The United States Bridge & Culvert Co. contemplates a new plant.

BAY CITY, MICH.—The Union Motor Co. has started on the second unit of its plant, to be 100 x 500 feet.

DETROIT.—The Detroit Gray Iron Foundry is erecting an addition.

DETROIT.—The Puritan Machine Co. has purchased a plant at Eighth and Fourth streets, which it will use as a machine and gear shop.

DETROIT.—The Canfield Tool & Die Co. has been chartered with $10,000 capital to manufacture tools and dies, by Jacob L. Summers and others.

DETROIT.—The Horvath-Arndt Mfg. Co. recently was incorporated with $10,000 capital to manufacture metal products, by Kurt Arndt and others.

DETROIT.—Jacob Shevitz, 195 East Ferry street, plans a tool and die shop, 2-stories, 80 x 150 feet, to cost $40,000.

DETROIT.—The Monarch Foundry Co. has awarded a contract to the Austin Co., Cleveland, for a foundry, 100 x 200 feet, a cupola building, 40 x 40 feet and core oven building, 40 x 40 feet.

DETROIT.—The M. M. W. Co. recently was incorporated with $3000 capital, by David R. Moisselle, Ismar Mueller and Henry N. Weinstein. The company will engage in a general metal manufacturing business.

GRAND RAPIDS, MICH.—Bernard C. Putnam, H. Monro Dunham and Eugene Jordan, all of this city, recently chartered in Delaware, the Welded Products Co. to manufacture cast iron, bronze, etc. The company is capitalized at $100,000.

JACKSON, MICH.—The American Gear & Mfg. Co. is erecting a plant addition, 169 x 280 feet, at an estimated cost of $180,000.

JACKSON, MICH.—The Robert Automatic Screw Co. has been chartered with $10,000 capital to manufacture screw products, etc., by Charles T. Cline and others.

KALAMAZOO, MICH.—The Humphrey Co., manufacturer of water heaters, will erect a 3-story plant addition.

MT. CLEMENS, MICH.—The Reynolds Motor Truck Co., recently incorporated, will erect the second unit of its plant next spring. Louis F. Wolf is president of the company.

WAYNE, MICH.—F. A. Volbrecht plans a machine shop, 1-story, 50 x 75 feet.

CHICAGO.—The Federal Electric Co. has awarded a contract for a plant to cost $150,000.

CHICAGO.—The Hurley Machine Co., 24 East Jackson boulevard, contemplates plant improvements.

CHICAGO.—The plant of the Chicago Toy Mfg. Co., 1815-19 Orchard street, recently was damaged by fire.

CHICAGO.—The Fairbanks, Morse & Co. has chosen a site here on which it plans a warehouse to cost $315,000. It will be 150 x 210 feet.

CHICAGO.—The Junkin Hydraulic Hoist Co. recently was incorporated with $12,000 capital, by John B. Junkin, Floyd I. Clark and Frank W. Fries.

CHICAGO.—The American Bosch Magneto Co. has voted to offer 30,000 shares of additional stock, the proceeds to be used for business expansion.

CHICAGO.—The Johnson Sheet Metal & Furnace Works, Inc., 751 West Seventy-ninth street, recently was incorporated with $5000 capital, by George Johnson, Louis Cohen and Max Cohen.

DECATUR, ILL.—The General Electric Co., according to a report, will erect a plant here to be 1-story, 200 x 300 feet.

DIXON, ILL.—The drawing mill at the plant of the Reynolds Wire Co. recently was damaged by fire.

EAST ST. LOUIS, ILL.—The machine shops of the St. Louis, Troy & Eastern railroad recently were damaged by fire.

ROCK ISLAND, ILL.—The Rock Island Stove Co. plans a building, 50 x 144 feet.

AUBURN, IND.—The Auburn Water & Electric Light Co. will install a 480-horsepower boiler, build a brick stack 125 feet high, equip its plant with an automatic coal conveyor, install an automatic underfeed boiler stoker and make other improvements.

ELKHART, IND.—The Godfrey Conveying Machinery Co. has started work on an office building addition, to cost $14,000.

EVANSVILLE, IND.—The Schroeder Headlight & Generator Co. will erect an addition.

FT. WAYNE, IND.—The Chalfant Can Co. recently was incorporated with $50,000 capital, by E. W. J. Yergens, A. D. Zuber and Albert G. Hughes.

FT. WAYNE, IND.—The Ft. Wayne Battery Mfg. Co. is completing a 2-story building, 54 x 196 feet and a boiler house, 50 x 57 feet. The company has taken options on several vacant lots adjoining the plant, which will be utilized for future extensions.

INDIANAPOLIS.—The Cole Motor Car Co. plans an automobile assembly plant.

INDIANAPOLIS.—The H. C. S. Motor Car Co. will erect two 4-story factory buildings, each to be 80 x 205 feet.

INDIANAPOLIS.—The Volta Battery Co. has been incorporated with $10,000 capital to manufacture electric batteries.

INDIANAPOLIS.—The Van Briggle Motor Device Co. has awarded contracts for a plant, 4-stories, 53 x 150 feet, to cost $100,000.

VINCENNES, IND.—The Indiana public service commission has granted permission to the Indiana Power Co. to issue bonds to take over the property of the Indiana Power & Water Co. It is reported new additions will be built.

AKRON, O.—The Franz Foundry & Machine Co. has been incorporated with $400,000 capital, by C. Franz, John A. Brittain and others.

CANTON, O.—Work has started on a foundry

building for the Hinderer Bros. Co., Twentieth street and the Wheeling & Lake Erie railroad tracks.

CLEVELAND.—The American Stove Co. has a permit to erect a warehouse, 45 x 211 feet.

CLEVELAND.—The Central Steel Castings Co. plans an addition, 21 x 35 feet.

CLEVELAND.—The Electric Steel & Forge Co. is selling additional stock to finance plant additions now in process of construction.

CLEVELAND.—The Guide Motor Lamp Co. has awarded contracts for a plant, 1-story, 50 x 126 feet, to cost $200,000.

CLEVELAND.—A permit has been taken out by W. H. Smith, 66 Taylor road, to erect a foundry and machine shop, 100 x 121 feet, at an estimated cost of $25,000.

CLEVELAND.—The Ohio Body & Blower Co. recently was incorporated with $550,000 capital, by Leslie Nichols, T. H. Hogsett, Williamson building, and others.

CLEVELAND.—The Victory Burner Co. has been incorpo ated with $10,000 capital by C. P. Diemer, F. L. Zimmerman, 914 American Trust building, and others.

CLEVELAND.—The Jones Gear Co., which recently completed a gear manufacturing plant, contemplates an additional unit which will double the capacity. Frank H. Jones is president of the company.

DAYTON, O.—The Lincoln Tool Co., recently incorporated with $10,000 capital, has purchased machinery and has leased a plant.

DAYTON, O.—Additional machinery will be purchased and a plant addition erected by the Davies-Young Soap Co.

DAYTON, O.—The Computing Scale Co. is said to be behind in orders and plans to purchase additional equipment.

DAYTON, O.—The Huffman Recording Pump Co recently incorporated is seeking a plant for the manufacture of gasoline measuring tanks.

DAYTON, O.—The Dayton Pneumatic Tool Co. recently increased its capital from $50,000 to $250,000, and contemplates the purchase of additional machinery.

DAYTON, O.—The Progressive Tool & Engineering Co. recently was incorpo ated with $25,000 capital, by William A. Thompson, H. W. Bonbright and others.

DAYTON, O.—Additional machinery will be purchased by the Educational Toy Mfg. Co., which plans to establish a plant either here or at Springfield, Mass. G. A. Eurbank, Springfield, Mass., is one of the directors of the company.

DAYTON, O.—The Progressive Tool & Engine Co. has been incorporated by Edward A. Reese and others, and has taken space in the Custer building, where it will manufacture dies, jigs, tools and special machinery. The company is capitalized at $10,000.

DAYTON, O.—The United Engineering Co., incorporated with a capital of $10,000, has purchased the stock and assets of the Special Tool Engineering & Mfg. Co. and will specialize in the production of a gasoline gage for automobiles.

DAYTON, O.—To produce tow lines and locks for automobiles, the Dayton Tow Line & Tire Lock Co., which was recently incorporated with $10,000 capital, has taken space in a building in the rear of 128 North Main street. John T. Rose, James Coffield and H. H. Kahn are among the organizers of the company.

DAYTON, O.—Most of the engineering research work of the General Motors Co. may be transferred to this city. The plant of the Dayton Metal Products Co. is being enlarged, including a boiler room and two 1-story plant units. The erection of buildings for the manufacture of an air cooled motor automobile is contingent upon the government's purchase of the Dayton-Wright Airplane plant. The General Motors Co. wil take over McCook field, and erect a large plant if the government buys the plant.

FREMONT, O.—The Auto Wood Stock & Ladder Co. is the name of a new concern which will start operations here in the manufacture of spokes and rims and automobile parts.

FREMONT, O.—The National Razor Mfg. Co. has been incorporated with $25,000 capital, by H. D. Petty, C. A. Ream, William H. Schwartz, W. A. Heyman and A. C. Yingling.

LIMA, O.—The Lake Erie & Western railroad is reported planning a new power plant.

MARIETTA, O.—The Safe Cabinet Co. has leased a 4-story building formerly occupied by the Leidecker Tool Co.

MT. VERNON, O.—The Williamson Hydraulic Clutch Co., according to a report, plans to increase its capital stock, and contemplates an addition.

TOLEDO, O.—The Ames Bonner Co. has awarded the Austin Co., Cleveland, a contract to erect a building, 3-stories, 60 x 192 feet, to cost $87,000.

TOLEDO, O.—The Maumee Malleable Castings Co. has awarded contracts for plant additions to cost $175,000.

TOLEDO, O.—The Threm & Davis Co., machine shop, 1514 Oakwood avenue, has been incorporated with $10,000 capital, by William B. Threm and C. A. Davis.

TOLEDO, O.—Contracts have been closed by the Automotive Corp., Spitzer building, for the first unit of its proposed plant. The building will be 1-story, 90 x 300 feet, and will be erected at an estimated cost of $60,000. Five similar buildings will be erected later.

WOOSTER, O.—The Wooster Implement Co. recently was incorporated with $20,000 capital by F. C. Stillinger, Charles L. Schaffter, J. F. Jones and O. P. Byers.

ZANESVILLE, O.—Organization of the Standard Radiator Co. is being perfected. The company will build a large plant here for the manufacture of radiators and boilers.

LOUISVILLE, KY.—The Swiss Machinery Corp. will build a gasoline plant in this city.

LOUISVILLE, KY.—E. N. Cruse and James E. Miller recently were named as the incorporators of the Fred Franke & Co., with $40,000 capital, which will engage in the manufacture of machinery.

CHARLESTON, W. VA.—The Charleston Pritchard Steam Tractor Co. has taken over the plant of the Grayson Tool & Mfg. Co. at Dunbar, Pa., and will remodel it.

MOUNDSVILLE, W. VA.—The Cameron Tool Co. has let the contract for a plant.

MOUNDSVILLE, W. VA.—The United Zinc Smelting Co. will build a plant to cost $500,000. O. Proells is president.

Throughout the West

DAVENPORT, IOWA.—Bids for an addition to the Frank Foundry & Machine Co. were taken recently. The building will be 22 x 35 feet.

DUBUQUE, IOWA.—A building of the International Harvester Co. recently was damaged by fire. The loss has been estimated at $260 000.

CARTHAGE, MO.—The Carthage Planing Mill plans a plant, 1-story, 44 x 90 feet.

ST. LOUIS.—The Bayer Steam Soot Blower Co. is having plans drawn for a foundry to cost $40,000.

ST. LOUIS.—The building occupied by the American Mfg. Co. and the Beall Pressed Steel Co. recently was damaged by fire. Total loss has been estimated at $200,000.

HOUSTON, TEX.—The Lucey Mfg. Co. contemplates a plant here, to cost $1,000,000. It will include a forge shop and will consist of eight units. The company manufactures oil-well machinery.

OKLAHOMA CITY, OKLA.—The Fountain & Fixture Co., 23 East Fifth street, has awarded contracts for a plant, 2-stories, 50 x 68 feet.

CENTRALIA, WASH.—The Washington Light & Power Co. is considering the erection of a plant here.

EVERETT, WASH.—The Sumner Iron Works is establishing a plant for the manufacture of tractors. F. L. Powell is general manager of the company.

SPOKANE, WASH.—The city is having plans prepared for a bridge across Hangman's Creek at West Riverside avenue to cost $45,000. J. R. Butler is city engineer.

WALLA WALLA, WASH.—The Gilbert-Hunt Mfg. Co. plant has been purchased by the H. H. Harris Mfg. Co., Stockton, Cal., which is reported planning to equip it and enlarge it by several new structures.

WENATCHEE, WASH.—The Wenatchee Valley Gas & Electric Co. is reported contemplating the erection of an addition to its power plant at Chelan Falls.

ASTORIA, OREG.—The plant of the Pacific Power & Light Co. recently was damaged by fire. The loss has been estimated at $20,000.

PORTLAND, OREG.—The Portland Tinware Sheet Metal Mfg. Co. has been incorporated with $4200 capital, by F. J. Martin, P. Hogenfeld and R. Schulsted.

PORTLAND, OREG.—The Albina Engine & Machine Works will dismantle its shipbuilding plant and resume its prewar work as a general machine and repair shop.

Business in Canada

MONTREAL, QUE.—The Rex Oil Burner, Ltd., has been incorporated with $750,000 capital to manufacture oil engines, etc., by Frank Callaghan, Percy A. Gregory and D. Patterson.

MONTREAL, QUE.—The Engineering Equipment Co., Ltd., has been incorporated with $20,000 capital, to manufacture mechanical, electrical, mining and contracting machinery, by P. J. Wolf, John Kerry and others.

BRIDGEBURG, ONT.—The Reliance Fuse Co. of Canada, Ltd., has been incorporated to manufacture electrical goods, with $500,000 capital, by Howard H. Baker, H. S. Southall and Albert W. Plumley.

HAMILTON, ONT.—The F. W. Corey Needle Co. is establishing a plant at 13 Ferguson avenue north.

TORONTO, ONT.—The Ransome Canada Products, Ltd., has been incorporated with $10,000 capital to engage in business as machinists, founders, etc., by Thomas Gibson, J. G. Gibson and Ernest P. Seon.

LEVIS, QUE.—The St. Lawrence Dock & Shipbuilding Co., Ltd., has been incorporated with $100,000 capital, by William H. Hutchinson, Charles A. Chauvean and others.

TORONTO, ONT.—The Curran Motor Radiators, Ltd., has been incorporated to manufacture radiators, etc., with $250,000 capital, by James W. Bicknell, Frank Richardson and John F. Lucas.

TORONTO, ONT.—The Canadian Carbon Co., associated with the Prest-O-Lite Co., has purchased a site of 10 acres, on which a large plant will be erected.

WINDSOR, ONT.—The Peninsula Machinery Co. of Canada, Ltd., has been incorporated to manufacture machinery, tools, etc., with $10,000 capital, by John A. Flynn, Stewart Hanley and Alexander R. Bartlett.

Increase Your Production By Using Link-Belt Labor-Saving Conveyors

DO you employ modern labor-saving conveyors in the handling of your products--or are you still using hand-labor to push your goods from place to place?

Production can be increased, manufacturing costs reduced and more contented workers developed by employing efficient modern Link-Belt labor-saving conveyors. Labor is scarce; therefore, employ YOURS to the best advantage.

We are specialists in designing and building mechanical conveyors for handling all materials, under practically all conditions. Our equipment can be found in almost every American Industry. Probably we can help you, as we have helped others. Get in touch with our nearest office. Catalog on request.

New Trade Publications

NEW CONSTRUCTION.—Westinghouse, Church, Kerr & Co., New York, are circulating an illustrated folder, entitled "Shops," in which views of a number of plants which it has erected, are given.

RECORDER.—A folder entitled, "Your Foremen Are Paid From the Neck Up," which is being circulated by the Gisholt Machine Co., Madison, Wis., calls attention to the use of a recording machine in manufacturing plants.

ELECTRIC TOOLS.—The Black & Decker Mfg. Co., Baltimore, recently published a booklet in which electric air compressors, portable electric drill and electric valve grinders are described and illustrated. Data pertaining to each are given in full, as well as specifications.

PHOTOGRAPHIC LENS.—A booklet has been issued by the Bausch & Lomb Optical Co., Rochester, in which the line of work adapted to various lenses is outlined. The booklet should be of value to purchasers in determining the proper lens for difficult work.

MECHANICAL EQUIPMENT.—The Wellman-Seaver-Morgan Co., Cleveland, has published a 16-page booklet in which dock cranes, at the United States army supply base at Boston, are described and illustrated. Line drawings of this equipment, numerous illustrations, and a complete description are presented.

TOOL CENTER.—A 4-page circular is being distributed by the Federal Steel Co., Detroit, in which an inserted tool center is described and illustrated. This center consists of two parts, a center or point and a steel sleeve. The sleeve acts as a holder of the center, which is held in place by the use of a tapered hole. The sleeve is of carbon steel.

ACETYLENE FLARE LIGHT.—A portable lighting apparatus, weighing 40 pounds, is described and illustrated in a folder being distributed by the Davis-Bournonville Co., Jersey City, N. J. It consists of a generator, 12 inches in diameter and 30 inches in height, carrying a pipe standard, which supports a reflector and three burners. Acetylene gas is conveyed to the burner through a hose from the generator. Other details are given.

RIVET FURNACE.—A furnace designed to meet the requirements of fabricators of structural steel and general forge work, is described and illustrated in a 4-page folder being circulated by the Champion Kerosene-Burner Co., Kenton, O. This furnace does not require any fuel or air connection, and can be moved about at will, even while operating. It produces a temperature of from 2500 to 3000 degrees Fahr., and uses kerosene for fuel. Other data pertaining to the furnace is given.

ELECTRIC DRILLS.—The Wodack Electric Tool Corp., Chicago, is circulating a 4-page folder, in which it describes and illustrates a new type of portable electric drill. Specifications are given, and the various parts of the tool are fully described. It is equipped with chrome nickel steel gears and aluminum alloy castings; has self-oiling ball bearings; and the gears run in a liquid tight grease compartment, which protects the motor windings. The switch is operated with the palm of the hand as pressure is applied, and when the pressure is released, the current shuts off automatically.

TUMBLING BARRELS.—A 4-page illustrated folder has been published by the Ideal Concrete Machinery Co., Cincinnati, in which automatic tumbling barrels are described and illustrated. These barrels are supplied with either a solid or perforated shell. The drum heads are castings ⅞ of an inch in thickness and are protected from wear by steel bands. The drum travels on iron rollers, which are rigidly fastened. The frame of the machine is of angle iron. The loader skip is raised by power transmitted from the counter shaft, though a 14-inch contracting band hoist, and an automatic stop prevents the skip from being hoisted too far. Other parts are described.

OPEN-HEARTH FURNACE.—An 18-page booklet is being circulated by the McLain-Carter Furnace Co., Milwaukee, in which open-hearth furnaces are described and illustrated. These furnaces are designed for both acid and basic melting, and a complete unit consists of a hearth, uptake flues, checker chambers, reversing valve, stack and charging floor. The hearth is built upon heavy cast iron plates supported on structural I-beams, and the walls and roof are securely held in place by structural I-beam buck stays. The door frames are made in sections and are easily removed. Other details are given and the illustrations show various parts of the furnaces.

Opportunities Abroad

Requests for information should be forwarded to district or co-operative office in your district, of the Bureau of Foreign and Domestic Commerce. Each request should be on a separate sheet and be accompanied by the opportunity number

A firm in Spain desires agencies for the sale of steel, electrical materials and supplies, copper, steel and iron wire, office supplies, etc. Correspondence should be in Spanish. Opportunity No. 31269.

An engineer in Belgium desires to purchase an agency for the sale of industrial materials and machines, turbines, boiler equipment, lathes, planers, shapers, etc. Correspondence should be in French. Opportunity No. 31271.

A firm in Switzerland desires an agency from an American copper refinery. Opportunity No. 31273.

A merchant in Spain desires agencies for the sale of axles, wheels, steel beams for railway cars, sheet iron, angle bars, round and T iron, and small motors for cultivators and pumps. Opportunity No. 31281.

An engineer in Lettland desires to secure the representation of exporters of agricultural machinery and tools, etc. Opportunity No. 31282.

The representation is desired by a merchant in Belgium for the sale of agricultural machinery. Correspondence should be in French. Opportunity No. 31283.

An agency is desired by a firm in the Netherlands for the sale of iron and steel goods, engines, tools and mechanical articles. Opportunity No. 31284.

A civil and mechanical engineering firm in India desires to represent manufacturers and exporters for the introduction into India of American machinery and engineering and structural materials. Opportunity No. 31312.

A firm in Canada desires to secure the sole agency for the sale of gas engines for fishing boats and other products. Opportunity No. 31314.

A company in Scotland desires to purchase one automatic wire-mattress weaving machine. Opportunity No. 31319.

An American firm having a branch office in England is about to open an office in Italy and desires an exclusive agency from manufacturers of agateware, machinery and other materials. Opportunity No. 31320.

An American exporter with an office in Italy desires to purchase and secure an agency for the sale of coal, copper, sheet and wire, and chemicals. Opportunity No. 31321.

A wholesale drug company in the Dutch East Indies, desires to receive catalogs and prices of optical supplies, lens-cutting instruments, etc. Opportunity No. 31322.

A firm of manufacturers' agents in Australia desires to secure agencies for the sale of all kinds of manufacturers' machinery, such as measuring and wrapping machinery, etc. Opportunity No. 31324.

A company in China desires to purchase hardware and tools, a list of which may be obtained from the bureau or district offices. Opportunity No. 31325.

A firm in Spain desires to purchase blacksmiths' anvils, etc. Opportunity No. 31327.

An engineer in Italy desires an agency for the sale of agricultural and industrial machinery, metals, etc. Correspondence should be in Italian or French. Opportunity No. 31330.

An American concern which is soon to install machine shops in Russia desires to secure an agency for the sale in Southern Russia of machine tools and overhead equipment for machine shops. Opportunity No. 31331.

Samples, catalogs and price lists are desired by a man in Spain with a view to representing firms for the sale of electrical supplies, carpenters and cabinet-makers' tools and accessories, etc. Correspondence should be in Spanish. Opportunity No. 31332.

The purchase or exclusive agency is desired by a firm in Spain for the sale of leather belting, hand-machine tools, etc. Opportunity No. 31339.

The purchase is desired by a manufacturer in Belgium, whose plant was looted during the war, of lathes, shears, forging presses for bolts and nuts, bolt-cleaning machines, and screw-cutting lathes for bolts and nuts. Catalogs and price lists are desired. Opportunity No. 31341.

A former machinery manufacturer in Hungary desires to secure an agency for the sale in Hungary and the Balkan states of machine manufactures. Opportunity No. 31342.

A manufacturer in Spain desires an agency for the sale of motors and dynamos, electric-heating apparatus, electrical conductors, insulated and copper wire on bobbins, etc. Correspondence should be in Spanish. Opportunity No. 31345.

An American firm in Poland, which is planning to erect a machine shop, desires an agency, purchasing goods outright, for the sale of machine tools, agricultural machinery, machinists' tools and electrical equipment. Catalogs and price lists are requested. Opportunity No. 31346.

THE IRON TRADE REVIEW

Vol. LXV Cleveland, December 4, 1919 *No. 23*

Coal Dominates Steel Market

Substantial Reduction of Mill and Furnace Output Appears Inevitable Under Restrictions Placed on Fuel Supplies—Material Scarcer and Prices Advance Further in Various Lines—November Pig Iron Production Grows

BOTH production and trade in iron and steel are dominated completely by the question of coal supply. Although the direct interference with furnace and mill operations as yet has been slight, the stage where extensive dislocation of plant activities may be expected is approaching rapidly. With more than 50 per cent of the iron and steel industry dependent for coke upon these plants, the action of the central coal committee in cutting supplies of coal to the beehive ovens, 25 per cent will have far-reaching effects. This curtailment represents a shrinkage of 65,000 tons of coke weekly in the Connellsville regions alone and over 100,000 tons weekly in the whole country. Since every ton of coke is needed at present in blast furnace and foundry activities, the enforced reduction of pig iron and castings output may be large. It is of great importance to the general industry, however, that the operations of by-product ovens are not to be interfered with, because of the large number of the steel works, blast furnaces and metallurgical plants which draw upon this source of coke supply.

Under the order, concerning beehive coke, of the fuel administration, the point of greatest effect probably will be the Pittsburgh district, and surrounding territory because of the heavy demands of that section upon the Connellsville operations. The steel department of one Mahoning valley works already is down due to a lack of coal and a large Youngstown steel works will close this week unless relief is forthcoming. The Bethlehem Steel Co. has banked six blast furnaces and is using a higher mixture of anthracite coal in its other stacks.

All Material Is Scarce

The coal stringency following on the heels of the loss of production occasioned by the steel strike, now past, has intensified the already strong position of the market. Selling has been driven into extremely narrow limits both because of the lack of material and the increased uncertainty of manufacturers over future costs. Sellers are able to name their own prices on virtually all products as buyers still are exceedingly anxious to get their wants under cover. The scarcity of wire nails remains acute. The 1920 requirements of this product are estimated at 20,000,000 kegs. The carryover of undelivered 1919 tin plate orders into next year will reach about 8,000,000 base boxes. The demand for line pipe for oil field purposes is tremendous. One order just placed involves 400 miles of 8-inch. If the Standard Oil Co., as reported, connects up its California and northern Texas holdings with a pipe line, this will require approximately 140,000 tons of pipe.

Iron Output Is Larger

November added greatly to the recovery of blast furnace operations from strike effects. Pig iron production in that period was 2,381,327 tons, a gain of 516,903 tons. This represented an average daily increase of 32 per cent. The gain in the number of active furnaces over October was 35, and the total of 251 blowing on the last day of November was only 15 less than in August, a pre-strike period.

Coke prices are following the expected course. Spot fuel is up 50 cents to $1 in the week. Eastern buyers are offering $8, Connellsville ovens, for both spot furnace and foundry coke. One Connellsville maker sold his entire 1920 output at $7, ovens.

Railroad business, actual and prospective, is mounting into big figures. The East estimates 375,000 tons of rails definitely are under negotiation for 1920 and 300,000 tons remain in the same position in the West. The Great Northern is inquiring for 1000 cattle cars and another 3000-car inquiry is up at Chicago.

Iron Advance Continues

As the demand for pig iron far exceeds the restricted tonnage which the makers are willing to offer, prices continue their weekly advance. No. 2 foundry is selling at $38, Buffalo, at $35 to $36 in the valleys, and at $35 in Alabama and Virginia. In the East No. 2X has been sold at $40 and $41. Recent basic sales at Pittsburgh total 40,000 tons or more, the last of which were at $33, valley furnace. Of bessemer sales aggregating 15,000 tons at Pittsburgh, the most recent were at $33.50 to $34, valley.

Effect of Mexican Intervention

WITH the strain in the relations between the United States and Mexico again near the breaking point, some consideration is being given in the nonferrous metal markets to the possible economic effects of intervention in the latter country. The extent of government buying of materials for munitions, obviously would depend upon the course and consequences of such intervention, something which cannot be foreseen.

A prompt reflection of military action undoubtedly would be seen in the foreign exchanges, with recovery in the pound sterling, the franc and other exchange values as measured in dollars. A recovery in exchanges would facilitate exports of copper, lead and zinc, and accordingly would strengthen the American markets. The financial situation would be further affected by the elimination of Mexico as a silver producer. Mexico long was the largest silver producing country in the world, but in recent years, due to the chaos there, has been second to the United States. Mexican lead production contributes an important part of the world's lead supplies, especially at present, when bitter strikes are in progress in Spain and Australia. In 1918 the United States imported 78,600 tons of lead from Mexico and thus far this year, 45,000 tons. This lead, which would carry a duty of 25 per cent if imported, is smelted and refined in bond and applied on export orders. Withdrawal of Mexican lead from the world's markets would result in foreign buying competition for domestic lead, with consequent higher prices. Mexico also is an important producer of copper, but world stocks of this metal are sufficient to meet immediate needs.

However, there are other, more abstruse but probably more important by-products of intervention which may enter into metal market calculations. Armed conflict might serve to awaken the public to a clearer view of realities and responsibilities. It might restore a true perspective to that part of labor which lately has been misled by a few pigmy-souled leaders. In other words, it might stimulate the country to get back to work, which is the only remedy we need for our present economic ailments. With the memory of the world war fresh in our minds, no sane citizen craves trouble with Mexico, but intervention might not be an unmixed evil.

Plotting Crane Business of 1919

IF THE shipments and orders figuring in this year's business in overhead cranes were roughly charted, the resulting graph would reveal conditions of unusual interest. The line representing shipments would start at its highest point in January, while that corresponding to bookings would begin in that month at its lowest mark. The line indicating orders probably would run along at this minimum for about five months and then shoot abruptly upward until in July it would reach its highest point. Following this line further, a slight drop in August would be noticeable but the level reached in that month would be maintained during the following two months, after which another slight drop would be indicated. It is problematical just where the line would end at the close of the year but it is quite certain that the volume of orders for December will be well above the low point of January.

Following the line of shipments from its high mark of January, no change would be perceptible during the period of the first four months, after which a sharp depression would indicate the decided slump which took place in May. Since shipments continued in this volume until August, the line would run parallel to the eighth month where it would rise slightly and then gradually descend to the year end.

Briefly summarizing, this chart would reflect large bookings at the beginning of the year which were to be completed; light bookings during the first five months with a heavy gain in the last half of the year; and light shipments as the shops made headway with their new business. Slight interruptions in the volume of shipments undoubtedly were caused

by labor trouble. However, it is safe to assert that even though orders in December fall still further, new business in the last half of the year will treble that of the preceding period.

Taking Dividends Through Esteem

IDEALS in business surely are working toward a higher level than ever before. Simply getting the money no longer is the only aim of the seller. To gain and hold the respect and esteem of the consumer is deemed no less desirable or necessary to a perfect business transaction as a profit. The time was when a monopoly was regarded simply as an opportunity and the buyer was made to pay whatever the traffic would stand. Now a monopoly is not only an opportunity but a responsibility. Both sides of the shield are con-

If conditions offer the opportunity to exact from the buyer the responsibility of the situation becomes an influential factor in determining what the seller may ask and prevents oppression. There comes to mind the attitude of a certain large producer of a raw material in the iron and steel industry which has come in recent years to a virtual domination of a large consuming field. Yet notwithstanding the opportunity to profit largely from this favorable situation prices have been held lower than would have been the case had there been competition in that field.

This interest has taken the lead in restraining rising quotations and has sold much below the level at competing products from other fields, when at least the same price could have been obtained In this case the responsibility has weighed heavier in the scale than the opportunity. This is a far-sighted policy which should build a deep foundation for the future and gain an esteem and trust from the consumer that will be a valuable asset to the producer in the years to come.

Is Open Hearth Gaining Favor?

UP TO the present time the most reliable and satisfactory information regarding the post-war status of the iron and steel industry in Lorraine, the Saar valley and the occupied districts of Germany have come from the report made by the commission appointed by the British minister of munitions. In an article appearing in this issue of THE IRON TRADE REVIEW, which is the third of a series based upon the report, the interesting statement is made that nearly all of the steel for high explosive shells was made by the open-hearth process. Furthermore, it is stated that only one company was able to satisfactorily produce high explosive shell steel in basic bessemer converters without heavy rejections.

In view of the fact that by far the greatest part of the steel made in the districts visited is produced by the bessemer process, the enforced employment of open-hearth furnaces is significant. European steelmakers have defended the converter because of the high cost of producer gas and the absence of scrap. They also point to the fact that 30 blows per 12-hour shift are averaged by converters in the Lorraine district, whereas the normal number of heats from an open-hearth furnace is three or four per 24 hours. Yet in spite of these apparently good reasons for preferring the bessemer process, the report of the commission contains numerous instances of building and contemplated additions to plants in which open-hearth furnaces are specified. In one German plant all of the steel is made in open-hearth units and in several new plants under construction on the west bank of the Rhine extensive open-hearth equipment is being installed.

It probably is premature to state that the turning point in the production of steel in Europe is in sight, yet there is strong evidence of a tendency on the part of steelmakers to look more favorably upon the open-hearth process. The output of open-hearth metal first surpassed that of bessemer steel in the United States in 1907 and 1908, and since that time the converter process steadily has lost favor. Possibly the experience with the open-hearth process gained by European steelmakers during the war may have a noticeable influence on the choice of melting equipment for the new steel plants which will rise as part of the reconstruction program of European countries.

Henry Clay Frick, Master of Steel

HENRY CLAY FRICK and his great talent which gained for him a mastery in big business represented an influential personality in the American iron and steel industry up to the day of his death. Unlike Andrew Carnegie, when he disposed of his interests in the Carnegie Steel Co. to the United States Steel Corp., he did not retire from the business world but placed his ability and knowledge in the iron and steel industry at the disposal of the giant and untested enterprise. All these years he has been one of the vital forces in the shaping and advancement of the Steel corporation to its present position of maturity and power. His work done and counsel given quietly in the high and inner administrative circles of that organization were no less effective and invaluable both to his direct interests and to the whole American iron and steel industry.

Henry Clay Frick, a power in the formative days of American steelmaking as a national industry, by his eminent qualities commanded for himself the signal privilege of becoming an outstanding figure in the era of great development that followed and which he no doubt foresaw.

Iron and Steel Prices

Corrected to Wednesday Noon

SCRAP, WAREHOUSE, ORE AND OTHER PRICES ON PAGES 1552 AND 1554

Pig Iron

Bessemer, valley	$34.00
Bessemer, Pittsburgh	35.40

No Halt In Rising Iron Prices

Threat of Curtailment of Furnace Output by Coal Situation Intensifies Already Strong Market—Pittsburgh Basic Sales Total 40,000 Tons and Price Reaches $33 —Northern No. 2 at $35 to $38—Southern at $35

Pittsburgh, Dec. 2.—Recent trading in the pig iron market here was featured by some big sales of basic. One merchant interest in November made sales aggregating more than 36,000 tons of this grade, of which 26,000 tons were sold during the last few days of the month at $32, valley furnace. This company also made sales of approximately 15,000 tons of bessemer last month, the most recent of which were from $33.50 to $34, valley furnace. Another merchant producer in the past few days has sold several thousand tons of basic to a Canton, O., steel manufacturer, at $53, valley furnace. Although recent transfers of basic grades are well up to 40,000 tons, shipments of which begin immediately, and run over the first quarter of 1920, only a part of the known inquiries have been covered. The Carbon Steel Co. is believed to have bought a portion of the 15,000 tons for which it recently inquired and it is not believed that either the Trumbull Steel Co. or the United Alloy Steel Corp., which also put out inquiries for substantial tonnages, have been covered in full. As far as can be learned the N. & G. Taylor Co. has not yet closed for the 3600 tons it asked for first quarter. The basic market now appears well established at $33, valley, and bessemer at $34, valley. A small tonnage of the latter recently was sold at $37, valley furnace for prompt shipment and an inquiry is out from a Pittsburgh district consumer for 500 tons for early 1920 delivery. Average prices in November for bessemer and basic iron in lots of 1000 tons or more as compiled by W. P. Snyder & Co., Pittsburgh, show a price of $30, valley, on bessemer and $30.16 on basic. This is the first change in the averages since last March. As to sales, the market has been somewhat quieter on foundry iron than it was recently, but this condition reflects the fact that makers are heavily committed against first half production and are unwilling to take on further tonnages. Several small lot tonnages of No. 2 foundry for prompt delivery recently have been sold from $35 to $36, furnace, and a sale of 800 tons for first half is noted to a Pittsburgh district structural company at $36, furnace. Two inquiries from 2500 to 300 tons of foundry iron for first half are before makers. The interest which sold the 800 tons of No. 2 grade at $36 for first half delivery has withdrawn from the market. Another merchant producer with furnaces in the valley and along the lake fronts also has withdrawn. Both of these makers have little or no tonnages unpledged for first half. A steady decline in merchant production over the last seven months, coupled with the loss of output occasioned by the strike, has produced a serious shortage of all grades of iron. The Cherry Valley furnace recently went into blast after being down for a little over two months for relining and rebuilding. This furnace has been considerably enlarged and now has a rated capacity around 400 tons per day. The Carnegie Steel Co. has 47 of its 59 stacks in blast, or only one less than just before the strike.

Upward Move Gains Momentum

New York, Dec. 1.—Now that pig iron prices are advancing so swiftly and the supply of iron is so thoroughly sold up, the question has arisen whether this is merely one of the periodical boom markets, or whether conditions for sometime to come will be dictated by the insufficiency of producing capacity. Where steel capacity has undergone a big expansion since 1914, it is pointed out that there has been no such expansion in pig iron capacity. Furthermore while the number of foundries throughout this district has not greatly increased in the past two or three years foundries generally have greatly increased their melting capacity. Hence, it is believed, the normal consumption of iron now is at a much greater rate than in prewar times. Eastern blast furnaces are well sold up. Makers in the Buffalo district and in central Pennsylvania, whose furnaces have been idle by reason of the strike or by lack of assurance as to fuel supply, will carry over into next year large undelivered tonnages on old contracts. Some of the furnaces which have been operating have disposed of the major portion of their first half output. A few makers either have taken only a little tonnage for first half or none at all. It is safe to say, however, that at least one-half of the total tonnage to be made by eastern furnaces during the first half of 1920, already has been sold. In view of this situation, demand during the past couple of weeks has involved a good deal more tonnage than the furnaces have been willing to book. It is this situation which is resulting in steadily rising prices. Eastern Pennsylvania foundry iron has been sold during the past week for first half delivery at $37 and $38 furnace, for 2.25 to 2.75 silicon, and at $39 to $41 furnace, for 2.75 to 3.25 silicon. The asking price on eastern Pennsylvania foundry in some cases now is

$40 furnace for 2.25 to 2.75 silicon. Central Pennsylvania iron has sold in round tonnages for first half at $37.50 furnace, for 2.25 to 2.75 silicon, and with some makers the minimum now is $39 furnace. The Virginia Iron, Coal & Coke Co., after being in the market for first quarter during the past week, withdrew today after booking what is said to have been a large tonnage in the aggregate. Other Virginia makers who still have some tonnage to sell for this year have advanced to the level that the Virginia company was asking on first quarter. The minimum on Virginia iron for any delivery now seems to be $35 furnace for 1.75 to 2.25 silicon and $38 furnace on 2.75 to 3.25 silicon. No Virginia 2.25 to 2.75 silicon is being offered now as far as known. Southern prices are advancing, and after sales at $35 Birmingham for 1.75 to 2.25 silicon one southern maker, in connection with some tonnage in this district, now is quoting $36.70, Birmingham, on 1.75 to 2.25 silicon, and $37.80 Birmingham, on 2.25 to 2.75 silicon. One lot of 1500 tons was sold by a Birmingham district maker reecntly for shipment into this territory this year.

Buffalo Prices Again Up

Buffalo, Dec. 2.—Still further increases in pig iron quotations marked the opening of the week in the Buffalo district. The market is flooded with an exceptionally large volume of good inquiry. All three grades of foundry have advanced in price due to the heavy demand as has basic and malleable also. There is no malleable being made, but there is a strong and insistent demand for it. The base price on No. 2 foundry (1.75 to 2.25 silicon) now is $38. The price on No. 2X (2.25 to 2.75 silicon) is $39.25 and for No. 1X (2.75 to 3.25 silicon) $41. Basic has gone to $36 and offers of $39.25 for malleable have found no takers. The prices quoted were definitely established this week by one producing interest with considerable first half capacity unsold, but were not announced by the other producing interest until early this week. Then the latter's old prices of $36, $37.25 and $39 were withdrawn in favor of the advanced figures, so heavy was the business on this level. Foundries which have seldom come into this district for iron, are inquiring and are willing to absorb the freight differential against them. December iron is practically a negligible quantity, except for very small lots from one furnace. Inquiry during the past week has totaled nearly 50,000 tons with many 1000-ton and some 5000-ton lots. One Susquehanna furnace is in operation of a battery of three. The others are being relined. This interest, due to the strike, has lost 80,000 to 85,000 tons of production, and it is doubtful when it will be in the market again. A producer sold 100 tons of No. 1X at $41 Monday and quoted $40 on 1000 tons of No. 2 foundry subject to immediate acceptance.

Prices Increase Rapidly

Cleveland, Dec. 2.—Extreme strength characterizes the pig iron market and as the demand far exceeds the available supply or the willingness of makers to sell, prices have continued to show rapid rise. Cleveland high silicon foundry iron was sold in the week at $36 for the base grade and the ideas of local makers now are not less than $35 to $36 for No. 2 (1.75 to 2.25 silicon). These prices largely are nominal, however, as Cleveland makers are not selling at present. Ironton makers have quoted $38 base furnace this week but have made no sales as yet at this figure.. Inquiries are coming from districts which have never before drawn iron from this territory. Basic iron is higher, a lot of 3000 tons for December having been sold this week at $33, valley furnace. This followed a sale of 5000 tons for the next several months' delivery at $32, valley furnace. The United Alloy Steel Corp., Canton, O., has been a buyer of considerable tonnage of basic and still is in the market. The Trumbull Steel Co., Warren, O., still is figuring on 10,000 to 15,000 tons. The coal strike rapidly is reaching the stage where it promises to affect the operations of both blast furnaces and iron consumers. Nothing of this kind yet has happened in this territory but coal supplies are becoming dangerously slow. Local blast furnace operations are unchanged.

Few Producers Will Sell

Chicago, Dec. 2.—Where to place contracts for pig iron is a difficult problem and of far more importance to holders than cost. As far as can be learned all southern producers are now out of the market with final sales before their retirement usually at $35, Birmingham. Northern producers have not been able to offer any iron for several weeks and see no prospect of taking further business until after the first of the year. The present quotation of $35, furnace, 1.75 to 2.25 silicon is purely nominal, as no sales are being made at that or any other figure. The only source of iron at present seems to be from producing centers east of Chicago. The Virginia Coal, Iron & Coke Co. has retired from the market after selling 2.25 to 2.75 silicon at $36.75, furnace, subject to freight rates of $4.10 and $4.90. This figures back to $35, base, for silicon 1.75 to 2.25, but none of that grade was available. One seller in the Chicago district is offering a small tonnage from a Virginia furnace at $36, furnace, subject to $5 freight rate, and full manganese differentials, which would mean $1.50 additional for 2 per cent manganese. An offer recently was made to a consumer of 1000 tons of foundry at $39, Buffalo furnace, with $5.30 freight. A sale of 1000 tons of malleable was made recently at $36, valley furnace, with freight of $3.80 for delivery any time before March 31. An inquiry is current for 4000 tons of malleable for second quarter and another for 1500 tons of malleable with silicon 2.25 or over. A southern Wisconsin tractor manufacturer is seeking for 1000 tons of foundry and another southern Wisconsin foundry wants 500 tons of foundry. In addition to the inquiry which is active, a much larger total would come out if melters saw any possibility of placing their orders. Producers of Lake Superior charcoal iron are receiving much inquiry but local representatives find it difficult to obtain a quotation as most of this business is being handled direct. One producer of silvery in Jackson county is taking business on the basis of $50, furnace, for 8 per cent, with $3.80 freight to Chicago. A Tennessee stack offers some tonnage for December at $50.25, furnace, for 8 per cent, with $3.40 freight to Chicago.

Southern Iron Again Advances

Cincinnati, Dec. 2.—Southern foundry iron has registered a sharp advance for first quarter delivery. The average quotation made by furnaces now willing to take on first quarter business, is now around $35, Birmingham, for 1.75 to 2.25 silicon. Practically no foundry iron of this analysis can be had in the South for prompt shipment, although some off-grade iron can be had. Southern Ohio has practically been cleaned out and no open offers are made for any shipment. However, some first quarter iron was disposed of during the past few days above $36, Ironton, for first quarter. It is currently reported that the production of malleable is being cut off on account of the coal shortage. Malleable is very strong and only a limited quantity can be had in southern Ohio. Definite quotations on malleable can not be obtained, but it is understood producers are watching foundry iron closely and such business as is taken is booked at the usual 50 cents advance over the base foundry price. The melting of iron by all foundries in this territory is very heavy. The stove foundries are probably consuming more metal than at any time heretofore. Consumers who are well provided for the future, are trying to get under cover, as the general impression seems to be that prices will go higher before Jan. 1.

Southern Production Off

Birmingham, Ala., Dec. 2.—Pig iron production is lower in the South. This is bound to bring about more caution among producers selling into next year. Quotations are attractive to the furnaces but apprehension is felt as to ability to deliver and to the cost of production. An advance in the wages of coal mine workers will bring about an increased cost in pig iron. The market is strong at $33 to $34 for No. 2 foundry (1.75 to 2.25 silicon) and there are indications that a further advance is likely. One furnace reports some sales as high as $35. Two furnaces are under repairs while the fires in three stacks have been banked for several weeks. Railroad car supply has not been up to expectations and as a consequence the reduction of accumulated stocks has not been as rapid as desired. Inquiries continue numerous and from all directions.

One maker of foundry iron in this district has advanced his price to $35 for No. 2 and is selling only to the second quarter. Considerable tonnage was closed formerly at $34. The advance of $1 per ton was made to take care of future conditions which

it is believed may include an advance in freight rates.

No Spot Iron Available

St. Louis, Dec. 2.—The demand for pig iron continues well in excess of available supplies. All classes of consumers are endeavoring to cover their requirements, both immediate and future. Inquiries are being turned down in wholesale especially those for early shipment. Apparently there is no more spot iron to be had. Spot sales during the week were confined to small lots of offgrades, or a few cars held by brokers, which brought premiums. The larger interests, it develops, are pretty well covered for this year, and through the first quarter but little iron has been contracted for the second quarter. Furnaces refuse to sell until something more definite is known as to probable production costs after this year.

Bank Stacks Because of Coal

Philadelphia, Dec. 2.—Effects of coal situation already are visible in the eastern blast furnace industry. The Bethlehem Steel Co. because of the fuel shortage has banked four stacks at South Bethlehem and two at Lebanon and is using a 10 per cent anthracite mixture at the remainder of its South Bethlehem furnaces. The pinch is beginning to be felt by other furnaces. One Central Penna stack unable to get steam coal is using coke under boilers. In view of the fuel situation as well as the sold-up condition, the furnaces are even less willing than before to book new tonnage. Frightened consumers have some large inquiries out. Several users would buy all way up to 15,000 tons of foundry iron each for first half. The avidity to purchase is shown by the fact that the Virginia Iron, Coal & Coke Co. in brief period it was in market sold 5000 tons for spot and 15,000 tons for first quarter. Most makers now are out of the market altogether without any price since they find any quotation they name is eagerly snapped up and they do not want additional business since orders now on books seem sufficient to take up 50 to 75 per cent of their first half output. One eastern Pennsylvania maker asked $40 furnace for No. 2 (2.25 to 2.75 silicon) and sales resulted. When he asked $41, business resulted. A small lot of No. 1X (2.75 to 3.25 silicon) offered at $43 eastern Pennsylvania furnace was snapped up immediately. On the other hand some eastern Pennsylvania foundry iron was sold the past week at $36 and $37 furnace for No. 2X. Some central Pennsylvania iron was sold for first quarter at $36 furnace for No. 2 plain (1.75 to 2.25 silicon), $37.25 for No. 2 X and this is minimum. The lowest for Virginia iron for any shipment now is $35 furnace for No. 2 plain, $37.25 to $38 for No. 1X and only December-January shipment is obtainable. Malleable has been sold for first half at $37 eastern Pennsylvania furnace. Several thousand of basic for next year were sold at $32 eastern Pennsylvania furnace; also a couple thousand tons were sold at $35 eastern Pennsylvania furnace. Some inquiry is out for basic. The Midvale Steel & Ordnance Co. has blown in another stack on basic. From 4000 to 5000 tons of copper-bearing low phosphorus were sold at $37 furnace.

Coke Market Moves Up

Spot Furnace and Foundry 50 Cents Higher—Sliding Scale Contracts Net More—Fixed Price Agreements Made Subject to Costs

Pittsburgh, Dec. 2.—Beehive furnace coke is decidedly stronger both on prompt and contract shipments. Several good-sized first half contracts have been closed on sliding scale agreements carrying a ratio of 5 to 1 on basic pig iron, valley furnace. On the present price of $33, for basic iron, shipments against these contracts, would carry a price of $6.67, ovens. The advance in basic also has materially enhanced the theoretical value of first half contracts made on a basis of 5½ to 1, which today would carry a price of $6, ovens. It is understood that 40,000 tons were closed by one interest on the basis of 5 to 1 for first half and also that 6000 tons for first half have been sold at a flat price of $7.50, ovens, without wage increase clause. Fixed price contracts have passed from favor, due to the inclusion by operators of a clause providing the buyer shall pay 50 per cent of any increase in coal or coke producing costs during the life of the contract. Notice has been posted in the Connellsville regions of the 14 per cent increase in wages; although this is a nonunion field, operators made the increase as a protection to their working organizations. Assuming a labor charge of $1.50 per ton of coal mined, the increase is 21 cents per ton, and on a basis that it requires 1½ tons of coal to produce a ton of coke, the increase in coke is 31½ cents per ton, and with buyer and seller sharing equally in the increase, the fixed price contracts made at $6, containing this provision, now will carry $6.15¾, ovens. It is stated that the labor cost in the Connellsville region averages considerably less than $1.50, this price being used merely for purposes of illustration, since it has the authority of government statisticians. It is feared a further advance will be necessary to bring about a return of the union miners and normal coal production. The nonunion fields, among them the Connellsville regions, will continue to be drawn on heavily for coal so long as other districts are not operating normally. Meanwhile, steel companies are not yet able to secure coal from their own mines, athough there has been no seizure of coal moving by water. Lacking coal for their coking plants, some of these companies are in the market for coke and it is the presence of these requirements that largely accounts for a sharp advance in the spot price. It has taken but a few new demands to send the price of spot 48-hour fuel up 50 cents. No standard furnace coke today is available under $6.50, ovens, and $7 is freely quoted. Prompt foundry coke also has stiffened about 50 cents now being rated at $7 to $7.50. The contract foundry coke market is nominal. Connellsville production of coke in the week ended Nov. 22, is estimated by *the Connellsville Courier* to have been 231,204 tons, against 253,024 tons in the previous week.

Coke Supplies at Low Ebb

Boston, Dec. 1.—Deliveries of coke from all sources are falling behind and several foundries have been anxiously endeavoring to get at least partial deliveries in order to keep their plants running. The New England Coal & Coke Co. has announced the price of $11.40 to govern December sales under its sliding scale contracts. The spot price on any coke it may have outside of contracts is $11.90. Some Connellsville coke has reached this territory at $11.40, delivered. The Everett, Mass., by-product plant recently has placed in operation another bank of ovens.

Some Makers Stop Selling

New York, Dec. 2.—An exceedingly active business has been done in coke here during the past week. Western Pennsylvania foundry coke has been booked for first half at $6.50 to $7, Connellsville. In some cases the contracts specify an advance in the cost of labor is to be added to the price. Numerous large lots were included, one being 5000 tons. Because the government may cut off the supply of coal to coke ovens, a number of the beehive interests have withdrawn from the market. The last price on spot foundry quoted by one of these interests was $7.25, Connellsville. The northern New Jersey by-product maker is ranked in the public utility class. Hence, this interest continues to receive a supply of coal. However, its receipts have been cut down and its operations now are around 85 per cent.

Virginia Fuel Higher

Cincinnati, Dec. 2.—Coke prices in the Wise county and New river fields especially, are higher. The nominal figure named for Wise county foundry ranges from $10 to $11, depending upon the shipment. Some spot foundry was offered in that field yesterday as high as $11.50. Connellsville furnace ranges from $5.75 to $6.25 ovens and foundry from $6.75 to $7.50. Pocahontas producers have practically sold no coke in this territory during the past few weeks. New River foundry coke is very scarce and as high as $13 has been asked, but the nominal quotation ranges from $11.50 to $12.

Buyers Covering at Advances

St. Louis, Dec. 2.—All grades and varieties of coke continue in excellent demand, with a well defined upward trend in values. There was some contracting in the week for first half at from 50 to 75 cents higher than for this year. There is a disposition on the part of all users in this district to hasten to cover. Foundry coke is bringing from $7 to $7.50 ovens according to quality.

Scrap Market Is Varied

Some Districts Show Little Effect of Coal Situation—Unsettled in Others—Bid $24.50 to $25 For Steel

FOR COMPLETE SCRAP PRICES SEE PAGE 1554

Chicago, Dec. 2.—Although lack of fuel, due to the miners' strike, has caused a number of scrap consuming plants to close down and probably they will not resume operation during the present year, the effect of this shortening of consumption has not yet been felt in the market for iron and steel scrap. Foundry grades are exceptionally strong, with prices advancing as pig iron goes to higher levels and supply inadequate to meet demands. No 1 wrought has been in heavy demand in spite of the fact that most bar iron mills are shut down from lack of fuel. Rerolling rails are quiet but all this material offered is taken readily. As to heavy melting steel, mills are not taking heavy tonnages at present, as they have bought freely recently. Dealers, however, are taking whatever is offered and will hold it for future needs. The Chicago & Northwestern has offered 5460 tons in which is included 1000 tons of No. 1 rails and 500 tons of No. 1 wrought. The Chicago, St. Paul, Minneapolis & Omaha offers 825 tons, the Kansas City Terminal 320 tons, and the Chicago, Burlington & Quincy 150 tons.

High Prices in New England

Boston, Dec. 2.—Last week marked the close of the best scrap iron and steel month of the year for New England brokers. Blast furnaces, steel mills and foundries all have continued to make strong demands. No. 1 machinery continued to advance until it reached $34.50, delivered. Other grades have advanced. Chemical borings sold at $18, shipping point, and turnings at $15. A sale of 1000 tons of rerolling rails was made at $27, shipping point. Pennsylvania steelmakers, particularly in the South Bethlehem district, have been large buyers of heavy melting steel, and although the price of this grade has not advanced proportionately, the market has remained firm and dealers are ready to pay $17.50 for the right quality. Several large sales of wrought pipe advanced the price to $18. The Boston district ordnance office continues to sell scrap brass and steel.

New York Buying Subsides

New York, Dec. 2.—Buying by the mills which featured the local scrap market last week has subsided and at present activity is being confined principally to brokers. These interests are not only buying for future speculation, but are covering, in some instances, on sales already contracted. Holders, however, are parting with their material slowly, and as a result the actual volume of trading in the past week has not been large. Prices on some descriptions continue to advance steadily. Heavy melting steel is now holding at $18 to $18.50, f.o.b. New York, an advance of 50 cents. It has been reported Pittsburgh consumers have been shopping around in the East, and have offered $25, Pittsburgh.

Steel Tonnages Sold

Philadelphia, Dec. 2.—The Alan Wood Iron & Steel Co. bought 5000 tons of heavy melting steel past week at $22.50, delivered. The American Bridge Co. at Pencoyd also bought heavily but the size of this tonnage is not known. This interest has been buying direct from producers and has been bidding as high as $24.50, delivered, and thus is advancing the market and making it still harder for other consumers to buy at lower prices. Generally the

Coal Shortage Effective

Pittsburgh, Dec. 2.—Although the scrap iron and steel market has been showing a strong upward tendency and materially higher prices have been established on a number of grades by actual sales, the coal shortage has become so acute at a number of steel plants as to result in suspension orders against shipments and in the past day or two the market has lost much of its buoyancy. It has been rumored that a Pittsburgh district steel company recently closed on 10,000 tons of heavy melting steel in excess of $26, delivered, but confirmation is lacking. The steel companies who have been in the market for supplies, however, admit making bids of $24.50 to $25, delivered, without securing any considerable amount of material. Dealers are asking from $26 to $27, delivered on this grade. A valley maker of sheets is among those who have stopped shipments against orders, as a result of the coal shortage and a valley blast furnace interest also has suspended shipments. A good market exists in steel axles, which can be rerolled into merchant bars, of which there is an acute shortage. Rerolling rails are not bringing more than $27 in this district, but are readily salable at much higher prices to West Virginia and Ohio makers of light sections.

Offer $23.50 For Steel

Buffalo, Dec. 2.—There is practically no heavy melting steel to be bought in this market, despite the fact that $23.50 is being offered for it. One mill in this district which has practically covered for three months, apparently has taken all the available scrap, and the broker handling the transaction is having a great deal of difficulty in obtaining the 25,000 tons for which $23.50 is being paid. Dealers are expecting a further advance in heavy melting steel. They are holding on to their stocks and are not inclined to let it go at that figure.

Market Looks Softer

Cleveland, Dec. 2—The outlook here for scrap iron and steel is unsettled. So far any weakness is not pronounced—it is more sentimental than actual—but most dealers do not look for a strong, healthy market until after the middle of January. Practically all of the local consumers of heavy melting steel have dropped out of the market. Buying in the valleys also has ceased. Up to $25.50 is reported having been paid for shells, on long delivery, and up to $24 for No. 1 railroad steel, but steel now can be bought in the valley for $23. Prices in the main are unchanged, but many are nominal in the absence of trading, and practically all are soft.

Cincinnati Market Backward

Cincinnati, Dec. 2.—The scrap market is not so firm and advances in pig iron have not yet been reflected in it. While the foundries are consuming large quantities of scrap, a number of steel mills supplied by this center, have been closed down for want of coal. This has necessarily cut down outside shipments materially and dealers' stocks now are increasing at a fairly rapid rate.

St. Louis Market Recovers

St. Louis, Dec. 2.—The iron and steel scrap market has run into a typical spell of watchful waiting. The scare which overtook dealers and yardmen last week and caused them to desire to ship material on contracts and sell, disappeared almost as suddenly as it came. Prices have held firm, with two or three advances noted, but business during the week has been extremely light. The position of consumers still is that they can not accept shipments, because of inability to get coal. The leading rolling mill interest has closed down on that account, and unless things improve, others will follow soon. This is a discomfiting influence. However, dealers see that the coal strike must end presently, and that demand be returned to the point where present fuel trouble found it. Steel is in fair demand, and heavy melting is quoted $1 higher at $21.50 to $22. Some fair sales of this grade have been made, one of 1000 tons to a local melter. Rolling mill grades remain in status quo. The mills still running have enough on hand for immediate needs, and do not care to take on more at present. Rerolling rails were marked up $31 to $32. Cast scrap is wanted and the same is true of malleable, but transactions are at a minimum. The railroads had no lists before the trade. One dealer in Texas was offering 3000 tons of railroad scrap in this market. Country dealers are beginning to offer tonnages. They are anxious to clean up their stocks.

Southern Inquiry Active

Birmingham, Ala., Dec. 2.—Old material is in demand and liberal inquiries are being received by dealers in Birmingham. The belief is now strong that there will be a strong market for scrap in quantity during the coming year. Foundries and machine shops, steel mills, cast iron and sanitary pipe plants and others who use more or less tonnage are well supplied with orders and there will be constant operation for an indefinite period. Scrap prices not only

are strong but are up considerably over 30 days ago. Heavy melting steel is not so firm however, consumers offering less than the published figures and apparently getting a supply.

Little Tin Plate

To be Available in Open Market For First Half

Pittsburgh, Dec. 2.—In view of the fact that the 1919 business which will constitute a prior lien on early 1920 production amounts to about 8,000,000 base boxes, or about 400,000 tons and is equivalent to 25 per cent of the theoretical annual capacity of the country, it is evident that makers will have only extremely small tonnages available for other than their regular customers. As a matter of fact, the American Sheet & Tin Plate Co. accompanied the announcement of the opening of its books for first quarter and first half of 1920 with an announcement that it would be obliged to allot its production and this company is known to have about all the business it can meet for the first three months of next year. It appears that the independent manufacturers are heavily committed and the best that manufacturers possibly can do will be to look out for the requirements of their regular customers. Although considerably more than $7 per base box, Pittsburgh, could be obtained today for standard tin plate for early delivery, makers generally are disinclined to consider inquiries from other than their usual customers and are not deviating from the $7 base. Independent tin plate manufacturers generally regard $7 as a fair price on domestic business. On export inquiries most makers are quoting $7.50, Pittsburgh, and talk of an $8 market is heard.

Allotted Entire Output

Buffalo, Dec. 2.—So insistent is the demand for tin plate that one manufacturer is said to have allotted the entire output for first half in less than two days from the time he announced his willingness to accept contracts.

Inquiries Are Heavy

Youngstown, O., Dec. 2.—Tin plate inquiries are extremely heavy at Mahoning valley mills. Books are closed, however, and no tonnages are to be had. According to export buyers, tin plate is commanding $8 per base box for foreign shipment and is hard to get at this figure. Considerable tonnage is being absorbed by canmakers and by meat-packing companies.

Strip Orders Large

Pittsburgh, Dec. 2.—Makers of strip steel practically have no tonnage available for delivery during the remainder of this year and the carry-over of 1919 business into 1920 promises to be so heavy that little tonnage will be available during the first quarter. One company in this district which was unaffected by labor troubles is naming February as the earliest time at which it can consider new demands in either hot or cold-rolled steel.

Shape Supply is Less

Mills No Longer Able to Make Early Deliveries—Plain Material Sells at Higher Prices—Awards Are Fair

New York, Dec. 2.—Few awards of consequence were reported in the local structural market in the past week, although inquiries came out at a fair rate. The largest inquiries noted were two lots of 800 tons for a hotel for the Y. W. C. A. in Washington, and a storage house in Baltimore. Mill quotations are tending upward. It is reported that as high as $5 a ton over the Pittsburgh base of 2.45c has been quoted on nearby shipments. As yet, however, the majority of the mills are adhering to the old level. It is expected that by the first of the year all of the independents will have advanced their offerings. What the leading producer will do is problematical but according to the best advices now obtainable, there will be no change.

New England Demand Grows

Boston, Dec. 2.—An active demand for structural steel is reported by Boston dealers. Prospective builders have been waiting in the hopes of finding reduced prices for steel construction work, but with the present rising market and the uncertainty ahead they are now becoming anxious and contracts for New England construction in the early spring are heavier.

Difficult to Place Tonnage

Philadelphia, Dec. 2.—Very few structural mills are in a position to take shape business for anything but deferred delivery. It is difficult to place any tonnage for anything this side of four to six weeks. Some eastern makers are taking on no new tonnage that does not net them 2.60c to 2.65c mill and some small lots are being taken at higher figures.

Prospective Business Big

Pittsburgh, Dec. 2.—While only a few structural projects of any size have come to fabricators in this district recently, it is stated that the volume of inquiries still is rising and expectations run strong that the turn of the year will see a large number of them closed. The McClintic-Marshall Co. has been awarded 4000 tons for the new turbine plant of the Westinghouse Electric & Mfg. Co. at Essington, Pa.

Building Tonnage Steady

Chicago, Dec. 2.—Placing of structural shapes is going forward in good volume, the largest project closed recently in the West involving 4370 tons for a storage and manufacturing plant for the A. O. Smith Corp. at Milwaukee. The Scottish Rite temple at Bloomington, Ill., requiring 319 tons, which was first awarded to the Decatur Bridge Co., has been given to the Bloomington Construction Co., on a revised bid. Plain material is quoted at 2.72c, Chicago.

CONTRACTS AWARDED

Extension to turbine plant Westinghouse Electric & Mfg. Co., Essington, Pa., 4000 tons to the McClintic-Marshall Co.

Building for Scio China Co., Scio. O., 100 tons to the Jones & Laughlin Steel Co.

Second unit of shop extensions for A. O. Smith Corp., Milwaukee, 4500 tons to Worden-Allen Co.

Manufacturing building for American Skein & Foundry Co., Racine, Wis., 175 tons to Worden-Allen Co.

Hide house for Pfister & Vogel Leather Co., Milwaukee, 500 tons to Worden-Allen Co.

Skip hoist and ore bin for Thomas Furnace Co., Milwaukee, 300 tons to Worden-Allen Co.

Washing plant for Cleveland-Cliffs Iron Co. at Hibbing, Minn., 300 tons to Worden-Allen Co.

New buildings and general alterations for Newport Chemical Co. at Carrollville, Milwaukee county, Wis., 400 tons to Worden-Allen Co.

Building for the Coca Cola Co., New Orleans, 409 tons, to Virginia Bridge & Iron Co.

Scottish Rite Temple for Bloomington consistory, Bloomington, Ill., 319 tons, to Bloomington Construction Co.

Building for the Post Printing & Publishing Co., Denver, Colo., 254 tons, to Denver Steel & Iron Co.

Warehouse for the Russell Grader Co., Cicero, Ill., 107 tons, to Midland Structural Steel Co.

Building for Upjohn Co., Seventh avenue, New York City, 300 tons, to Geo. A. Just & Co.

CONTRACTS PENDING

Trusses for Drake Hotel, Chicago, 200 tons, bids asked on revised plans.

Y. W. C. A. hotel, Washington, 800 tons, pending.

Telephone exchange in Bronx, New York City, 300 tons, bids in.

Church in Holyoke, Mass., 200 tons, bids pending.

Proof shop at Washington navy yard, 300 tons, general contract to Stang & Mitchell, Philadelphia.

Power house for Leaver Bros., Cambridge, Mass., 300 tons, bids pending.

Storage house for fertilizer plant of Guano company, Baltimore, 800 tons, bids pending.

Sellers' Market

Rules Completely in Wire Products—Higher Nail Extras Agitated

Pittsburgh, Dec. 2.—The market for wire products, particularly for nails, is purely a sellers' affair. Practically all companies in this district are out of the market and quotations for that reason merely are nominal. It is understood, however, that one of the smaller companies recently took an order for 5000 kegs for delivery over the first quarter at 6.60c, base, Pittsburgh, and there are unconfirmed rumors that one of the larger independents has taken business as high as 7.00c, base Pittsburgh. In the opinion of some makers a famine of nails is probable, not because of a lack of productive capacity so much as because prices have been so unprofitable that much machinery has been allowed to remain idle. Only through an increase in the base price or the introduction of a new card quoting higher extras, it is stated, will the larger independent companies resume production on the scale warranted by the demand. Next year's requirements of nails are estimated at 20,000,000 kegs. The present nail card was established in 1896. Demand for wire is only slightly less insistent than for nails. Little progress has been made in cutting down the accumulation of orders piled up as a result of the strike. One company not affected materially by the steel plant strike has withdrawn from the market owing to the possibility of being obliged to suspend from a scarcity of coal.

Bar Orders Very Heavy

Buyers Continue to Seek Position on Mill Books Despite Deferred Deliveries—Making Sales on Higher Basis

Chicago, Dec. 2.—Consumers of soft steel bars find difficulty in placing their orders, as the leading independent is entirely out of the market, having little remaining tonnage for first half, and the leading interest is accepting contracts subject only to delays. Orders for bars are heavier than for any other form of finished steel, and books are heavily loaded. In spite of this fact, new business is coming in large volume and consumers show much anxiety to get a position on mill books for as early delivery as possible. The leading interest is nearly sold out on its entire tonnage for first half of 1920. No difficulty has been experienced yet on account of the coal strike, and consumers have not asked to have deliveries delayed, apparently being willing to take in their raw material even though forced to shut down for lack of fuel. The quotation is steady at 2.62c, Chicago.

All mills producing bar iron in the West are shut down for lack of fuel and none of this product is being turned out. The idleness forced on these mills is the more irksome because of the excellent tonnages on books and the heavy demand which would have given steady operation for many weeks. In spite of inability to produce, mills are able to take on additional tonnage, subject to delay. The quotaton ranges from 2.77c to 3.00c, Chicago mill.

Several producers of rerolled high carbon bars have been forced to shut down by lack of coal with large tonnages on their books. Practically no new business in this material has been booked for some time, the most recent quotation being 2.85c, Chicago.

Impossible to Buy Tonnage

Philadelphia, Dec. 2.—With the developments in fuel situation, it is almost impossible to buy steel bars from the mills. Considerable tonnage for next year has been sold the past week at 3.00c and 3.25c Pittsburgh for commercial quality and at 3.50c for forging quality but the mills now are out of the market having sold about all they can make for the first half.

Shortage Still Unrelieved

Pittsburgh, Dec. 2.—A shortage of merchant steel bars bordering on the famine stage still exists and buyers in need of early tonnages are naming extremely high prices in an effort to cover. On a small tonnage of small size oval bars a price of 7.00c base Pittsburgh recently was offered and on squares and rounds, bids of 2.75c and 3.00c Pittsburgh have been common. The market actually is quotable anywhere from 2.35c to 3.25c Pittsburgh, for the Carnegie Steel Co. still is taking some business at the lower figure although shipments against such orders cannot be made until well into 1920 because of the business backed up as a result of the strike. As yet little headway has been made in cutting down accumulating bookings. Small sales by independent companies are being made at 2.75c to 3.25c for prompt shipment. Forging bars are in extremely scant supply since because of scarcity of labor and the extra work required in making forging billets, production of the latter is extremely low. Makers of iron bars still are flooded with business and most of them now are so heavily committed as to be indifferent to demands except from regular customers. The recent price of 3.25c Pittsburgh for common bars is firmly maintained. The Pennsylvania railroad, lines west, recently closed on 650 tons of iron bars at 2.75c base Chicago, for common bars and 2.90c base Chicago for specification iron.

Demand is Strong

Buffalo, Dec. 2.—There is a strong demand for bars, particularly for forging purposes. Bar mills here are operating and are getting fair production.

Acute Shortage Exists

Pittsburgh, Dec. 2.—The past week has seen little or no improvement in the supply situation in merchant steel bars and makers of cold-finished steel bars dependent on outside sources for their merchant bars still are operating on a much curtailed program. New demands, especially for the smaller sizes of rounds, flats and squares, cannot be entertained by these manufacturers. One company here which makes its own merchant bars recently withdrew from the market until it ascertains whether the scarcity of coal is going to affect plant operations. While all companies are quoting 3.60c, base Pittsburgh, buyers will pay much more to secure desired material.

Bar Shortage Prevails

Chicago, Dec. 2.—In the face of unusually heavy demand for bolts and nuts and larger inquiry than mills could handle were they able to operate at full capacity, most producers face the possibility of a shut-down from lack of bars.

Prices Still Headed Higher

Pittsburgh, Dec. 2.—Still higher prices have been established on both bolts and nuts because demands continue heavy and makers already are so heavily committed as to be indifferent to new business except at more attractive prices. Current production is far behind contract requirements due to the scarcity of bars and much business has been backed up by this condition. Carriage bolts now are not being booked for less than 45 and 5 off for round thread and 45 and 5 off for cut thread in the smaller sizes, while larger sizes are taking flat discounts of 30 and 10. Rolled thread machine bolts are quoted at 50 and 7½ to 50 and 10 off and cut threads at 40, 10 and 5 off for the small sizes and 40 off on the larger sizes. Nuts are quoted at 2.50c off on blanks and 2.25c on capped. Track bolts have been sold at 5.00c Pittsburgh in carloads and 5.50c plus one cent a pound extra for less than carloads. Rivets are holding at 4.15c for structurals and 4.25c for boilers but some makers still are selling at 4.00c and 4.10c respectively.

Sheet Tonnage Is Scarce

Pittsburgh, Dec. 2.—While much talk is heard of premium business in sheets for early delivery, this refers to only a small tonnage compared to the whole. The American Sheet & Tin Plate Co. is not deviating from the March 21 prices for the first half of 1920 and while some of the independents have accepted some business at an advance, it is declared that the average on all bookings is close to the old figures. Regular customers are having such business as the mills can take placed on the books at the regular basis. Neither the leading interest nor the independents can take on much additional business, for the loss of production during the strike was considerable and this tonnage must be accommodated out of production for the early part of next year. Making up this loss, it is figured, will take the better part of the first quarter and this only if no further disturbance of labor occurs and the coal scarcity does not interfere. The latter danger is imminent and it is reported that some western mills already have been obliged to suspend. While the American Sheet & Tin Plate Co. is taking orders for the first half, the independents are not committing themselves beyond the first quarter. On most of the business being booked, 4.35c, Pittsburgh, is the base on black sheets, 5.70c on galvanized and 3.55c on blue annealed.

Holds No. 10 at 3.75c

Philadelphia, Dec. 2.—The leading eastern maker now has minimum on No. 10 blue annealed of 3.75c Pittsburgh. Some first quarter contracting has been done on this basis although business is being turned away in volume. Premiums continue to be paid on all kind of sheets.

Large Premiums Are Offered

Youngstown, O., Dec. 1.—Sheets continue extremely difficult to obtain from Mahoning valley plants. Virtually all mills are booked through the first quarter and are not offering beyond that period. Dealers who have combed this territory for any grade find material almost unobtainable. Despite this sold-up condition buyers continue to send in heavy inquiries, with blue annealed and galvanized in the greatest demand. Premiums are running wild, almost every inquiry having an offer of this character attached. So far as can be

learned little business of this class has been entertained by valley mills.

While no mills have been forced to close on account of the fuel shortage, still this condition must be considered. The steelmaking department of one sheet producer already is idle and part of another is expected to close this week unless the situation improves. A shortage of steel means a shortage of sheet bars and perhaps another jump in the price of semifinished material. Consequently sheetmakers here are going slow not knowing what is before them.

Sheet quotations in the Mahoning valley are nominal. In many instances buyers have offered $15 per ton premium for light-gage blue annealed and galvanized for spot delivery and yet have been unsuccessful in obtaining these. A certain buyer is in the market for about 1500 tons of galvanized, No. 26 and lighter, and is willing to pay considerably over $20 a ton premium. If sheets were available at valley mills blue annealed would carry a quotation between 3.90c and 4.25c; black, between 4.65c and 4.85c; and galvanized around 7.50c. One large automobile maker in the Detroit district has bought sheets on a premium basis on several occasions recently and in as large a quantity as he could get. Few wasters are to be had. Buyers have been eager to obtain any kind of sheets and have absorbed waster stock along with primes. Consequently, prices of nearly all sheet mill by-products have stiffened. Galvanized seconds are quoted between 5.50c and 5.70c; fine finished seconds, between 4.60c and 4.75c; and pickled seconds, between 5.25c and 5.50c base.

Ferro Selling At $120

Round Tonnage Sales Establish Market at Recent Advance—English Metal Offered at $115 Delivered—Spiegel Also Higher

New York, Dec. 1.—Domestic makers of ferromanganese who put up their price on 78 to 82 per cent metal a week ago, to $120 delivered, have made sales of round tonnages during the past week for next year at this figure, and it is believed that this now represents the market on domestic standard metal for any delivery. However, English metal now is offered at less than this figure. One importer has been cabled by his English principal, an authority to sell 76 to 80 per cent English metal for first quarter at $110 tidewater, which is equivalent to around $115, delivered at consuming plants. English makers, however, during the week refused to consider bids of $110 delivered from domestic consumers for large tonnages. Domestic inquiry now amounts to 4000 to 5000 tons. In addition, there is an inquiry for 1000 tons for shipment to South America.

Spiegeleisen advanced during the past week. About 1500 tons of 20 per cent metal were sold for domestic use at $37 to $38 furnace, and there are inquiries for several thousand tons from domestic sources. There are also big inquiries from abroad involving many thousands of tons. These inquiries come from Holland, Belgium, France and Germany. The unfavorable exchange situation acts as a bar to the closing of this business.

Some additional inquiries for small tonnages of ferrochrome for next year, in addition to the 12,000 tons recently reported, have appeared. The price of standard ferrochrome, containing 6 to 8 per cent carbon, is 27 to 29 cents per pound contained, although it is rumored there has been some cutting. Alloy containing 1 to 2 per cent carbon is quoted 70 to 75 cents per pound.

The market for ferrotungsten is extremely dull. Foreign alloy still is available at $1 a pound contained and lower, while domestic makers continue to ask $1.10 to $1.20 a pound contained, at which they are taking a little business.

The 50 per cent ferrosilicon market is dull. While a few consumers of this metal have contracted for next year, the majority appear to be waiting, possibly intending to buy from hand to mouth. The market on 50 per cent remains about $80 to $85, delivered, and on 75 per cent, $145 to $150. A quotation of $250, Montreal, recently was paid on some 90 per cent, to which would be added freight and 15 per cent duty.

Ferro Sales Made at Advance

Pittsburgh, Dec. 2.—The recent advance in 80 per cent domestic ferromanganese to $120 furnace, freight allowed, has been paid in several small lot sales in the past week and this price represents the minimum figure of all makers. At the moment, English makers are not a factor. The strong pig iron market now is a factor in ferromanganese. Since this material is produced largely in blast furnaces, makers, in the failure to profitably produce ferromanganese, can turn to pig iron at remunerative figures.

Spiegeleisen is held at $40 to $45, furnace, for 18 to 21 per cent material but the last business of any account in this material was around $35, furnace.

Recent stiffening in the price of 50 per cent ferrosilicon appears to have been only partly sustained, for buyers seem to have been frightened. There is a lack of sales at the higher asking prices. The asking price runs from $85 to $90 furnace, freight allowed, generally, but it is known some Canadian material is in the hands of middlemen bought at a price at which it could be profitably turned over at less than $85.

Bessemer ferrosilicon remains in light demand but prices are firm in the lack of big production or large free stocks. Jackson county, O., makers whose furnaces have been down for several months are resuming.

Demand and Price Up

Chicago, Dec. 2.—Considerable activity has developed in ferroalloys, and two sales of 500 tons each of ferromanganese recently were made in this district at $120. There is some other inquiry which has not yet been satisfied. A sale of 300 tons of 50 per cent ferrosilicon was made recently at $90, delivered. Spiegeleisen is now quoted at $45, eastern furnace.

Car Plates In Demand

New York, Dec. 1.—About 80,000 tons of rolled plain material largely plates will be required for the 5500 tank cars recently distributed by the Union Tank Car Co. With the axles and wheels 100,000 to 110,000 tons will be required for these cars.

Eastern Demand is Huge

Philadelphia, Dec. 2.—Plate makers are swamped with demand and some say they could sell enough to take entire 1920 output. Practically every eastern shipyard has out inquiries. A Baltimore yard placed 5000 tons with the leading interest at price reported to be 2.50c Pittsburgh which compares with 2.75c Pittsburgh done by some eastern makers on first quarter contracts and 2.85c eastern mill done on some small tonnage. The Standard Oil Co. of California is in the market in New York for four to 10 tankers requiring about 15,000 to 40,000 tons of steel.

Most Makers Hold to 2.65c

Pittsburgh, Dec. 2.—Although the plate market must be quoted from 2.50c to 2.65c, Pittsburgh, in view of the fact that the lower price recently was named by the Carnegie Steel Co. against a shipbuilding inquiry, makers in this district generally are holding to 2.65c and claim ability to obtain that price on tank plates. The Standard Oil Co. is reported to have put out an order for 20 oil storage tanks, the first part of a total for 200. Builders of oil and gas tanks are extremely busy at present, not only on domestic, but on foreign orders. Demand for plates in connection with this business is large and urgent and all makers have substantial bookings. Pittsburgh district car builders have only a moderate amount of business before them at present.

Plate Mill Operating

Buffalo, Dec. 2.—The Donner plate mill now is in operation. It went into production last week for the first time, since the tie-up as a result of the steel strike.

Demand Continues Strong

Chicago, Dec. 2.—Inquiry and sale of steel plates continue strong, most of the demand resulting from continued activity in the production and transportation of oil. Demand for shipbuilding has been held up and not much business is being booked from this source. Most of the plates now needed are for tank cars and oil tanks, although other users of plates are in the market for their usual requirements.

Railroad Demand

On Increase—Orders Pending in East —Car Inquiry Heavy

New York, Dec. 2.—It is estimated that the rail tonnages which now are under negotiation for 1920 in this district total about 375,000 tons. Of this total, the New York Central is expected to take 150,000 tons, having cut down its requirements to that figure. Practically as much, it is expected, will be taken by western roads who do their purchasing in New York and the remainder will be taken by the Erie, Lackawanna, New York, Ontario & Western, Lehigh Valley, Central of New Jersey, Delaware & Hudson and smaller roads having their headquarters in this territory. The Erie already has placed 28,000 tons and the New York Central is expected to distribute its tonnage this week.

The orders for tank cars just placed by the Union Tank Car Co. constitute the biggest business which has been closed by one interest at one time in the history of the tank car trade. The Union Tank Car Co. just has added another 1000 cars to its order with the Standard Steel Car Co., making a total of 3500 to be made by the latter interest. As the business now stands, the Standard Steel Car Co. will build 3500 cars, the Pressed Steel Car Co. and the Cambria Steel Co., 750 each, while the Union Tank Car Co. will build 500 cars in its own shops at Lima, O., thus making a total of 5500.

Many Rail Orders Pending

Philadelphia, Dec. 2.—Since the Pennsylvania placed its order for 186,000 tons of rails which may be increased, many other roads have given an idea as to their tonnage needs for 1920. The Reading is expected to buy about 25,000 tons for itself and the Jersey Central. The Baltimore & Ohio is expected to buy 75,000. The Norfolk & Western took bids on 26,000 tons but has reached no decision. The Virginian wants 16,000 to 18,000 tons.

While some makers still are willing to book rails on basis of $47 mill for open-hearth, one mill is asking $57 mill.

Rail Tonnage Still Open

Cleveland, Dec. 2.—The Pere Marquette railroad has reached no decision on 37,000 tons of rails on which it took bids week or 10 days ago.

More Car Inquiry

Chicago, Dec. 2.—The Great Northern railroad is inquiring for 1000 cattle cars requiring about 350 tons of plates and shapes, and 1600 tons of axles. An inquiry is now current for 3000 freight cars requiring 35,000 tons of plates, shapes and bars and 5000 tons of axles. It develops that the contract for 1000 tank cars recently placed in the West and supposed to be a portion of the purchase by the Union Tank Line Co. is for 1000 tank cars for the Gulf Refining Co., which went to the Standard Steel Car Co.

Negotiations for about 300,000 tons of standard steel rails for western railroads are practically complete but the sales are contingent on the roads being turned back to their owners at the end of the year.

Heavy Tonnages

Involved in New Line Pipe Orders— Western Cast Pipe Up

Pittsburgh, Dec. 2.—Several inquiries for line pipe recently have come before makers in this district and one involving 400 miles of 8-inch pipe for delivery next spring has been placed. This came from the White Oil Corp. and is for shipment to the southwest. The National Tube Co. took 225 miles of the order, the Youngstown Sheet & Tube Co. 100 miles and the remainder was scattered among other producers. It is reported that the Standard Oil Co. is planning to connect up its California and northern Texas holdings with an 8-inch pipe line which would involve the purchase of approximately 140,000 tons of pipe. Another inquiry from the southwest calls for 750 miles of 8-inch pipe and in view of the fact that manufacturers also have before them a number of inquiries from the United States of Columbia and Mexico, it is more than likely that before Jan. 1 they will be booked to capacity on this class of tubular goods for the whole of the year. Pressure of inquiries for oil goods are heavy. Although demands for merchant pipe are small in comparison with those for the larger sizes, four to five months is the best delivery that the National Tube Co. is offering on buttweld sizes and other producers are naming even longer dates due to the fact that they have been more seriously affected by the strike.

Premium Prices

Rule on Limited Sales of Semi-finished—Report $50 Billets

Pittsburgh, Dec. 2.—Good demand is noted for billets and sheet bars with buyers prepared to pay substantial premiums in order to obtain tonnages, but actual transactions are much restricted because of the lack of supplies. Makers generally are committed against practically all of their current production and are inclined to meet these obligations before entertaining new inquiries. As nearly as the market can be gaged, sheet bars are quotable at $45, Pittsburgh or Youngstown, and 4 x 4 billets at $42 to $44 with the usual extras for size above and below these dimensions. It is reported that one steel company recently opened its books for first quarter business and named $50 on standard sized billets and on slabs.

Wire rods appear to be quite plentiful, but sales continue to be reported at from $60 to $63 for base grade.

East Sells Still Higher

Philadelphia, Dec. 2.—Sales of billets and slabs the past week in this district apparently totaled more than 15,000 tons. Rerolled billets brought $48 to $50 Pittsburgh or $52 to $54 Philadelphia, slabs brought $50.50 to $52.50 Pittsburgh and forging billets $56 to $60 Pittsburgh. Sales involved mostly rerolling billets and slabs. Large inquiries for rerolling billets are before trade as are also a number of moderate sized lots of forging billets.

The Nonferrous Metals

NEW YORK, Dec. 2.—The coal crisis, the threat of trouble with Mexico, the steel strike, the erratic movement of foreign exchange, the continued unrest among labor in various trades and districts and the failure of the peace treaty to be ratified constituted conflicting but generally depressing factors which the nonferrous metal markets spent another week in digesting. The lack of goods, abroad and in this country, however, is such that a steady bull force is behind the markets and even the serious obstacles to business at present experienced are not sufficient to stop this force.

The copper market has taken further count of the failure of the peace treaty, on which had been based hopes of renewed large exports of the red metal and copper prices have been pegged lower, until today brought a little reaction and hope, at 18.25c. The lead of the market has passed to the large producers, who have so far departed their recent aloof policy as to develop lower prices than second hands. On Monday electrolytic copper could have been had from large sellers at 18.00c a pound, and possibly a shade lower. Casting copper now is 17.75c to 17.87½c. Lake is 18.50c to 18.62½c. Some second hands have supplies of copper for which they paid more than the current market; these sellers are not now offering freely.

The tin market has been extremely confused by the erratic movements of the markets at London and Singapore. These markets have been chasing each other up, until on Dec. 1 the Singapore price was £299, c.i.f. London. The New York price for Straits has ranged from about 54.00c to 54.50c for spot and futures the past week. Banca was quoted about a quarter cent lower and 99 per cent about half a cent below Straits.

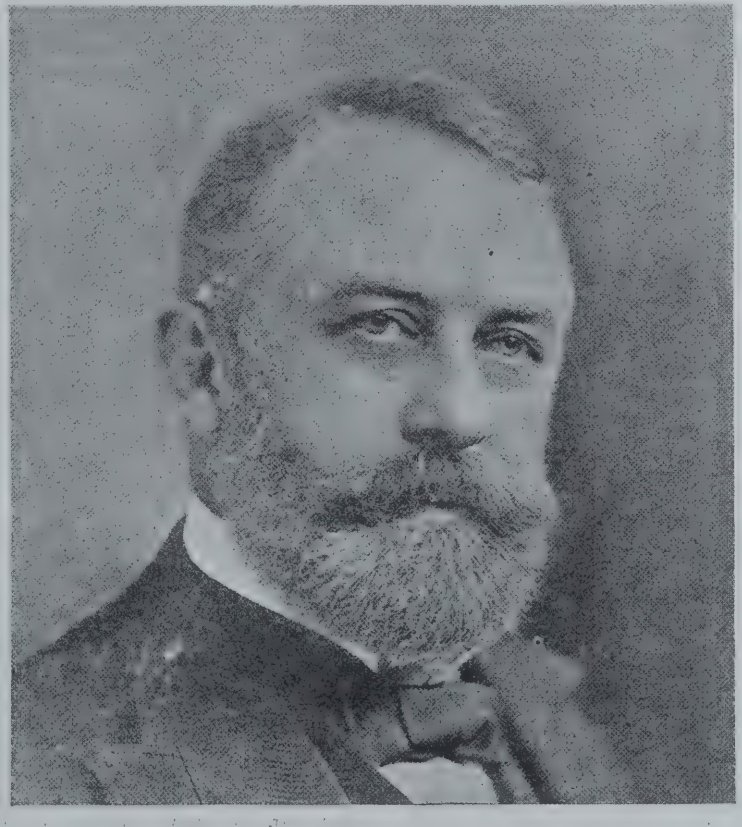
The zinc market recovered still further, on fair inquiry from galvanizers and active demand for export, England, France and Japan being in the market. Producers have not been keen to sell and dealers have been experiencing some little difficulty in obtaining supplies. The market for prime western zinc reached 8.15c to 8.20c East St. Louis, for December and first quarter shipment by Dec. 1, and was firm today at 8.20c.

The lead market was steady at 6.90c, New York basis, for tonnages of more than one carload the past week, held by outside sellers. The leading producer continued to quote 6.75c, New York. The world lead situation continues acute.

The antimony market is unchanged at 9.25c, duty paid, New York.

The price of seamless brass tubing was reduced two cents a pound to 30.50c Dec. 1; seamless copper one cent a pound to 32c base; and today sheet brass was cut one cent to 24.25c, rod to 22.75c, sheet copper 1½ cents to 28.50c, and wire to 21.75c.

Henry Clay Frick



Dec. 19, 1849—Dec. 2, 1919

HENRY CLAY FRICK, whose name and career have been joined with the development of the American iron and steel industry as those of few other men of his generation, died at his home, 1 East Seventieth street, New York City, Dec. 2, from the effects of ptomaine poisoning, from which he had been ill since early in November. Although his illness had been considered serious, his death came as a surprise to his friends and business associates, as he had almost recovered and undoubtedly would have regained his health but for complications which set in. His death was not made public until several hours after he had died. At one time he was the world's largest producer of coke and operated almost 40,000 acres of coal land. Mr. Frick's death brings to a close the life of one of the country's leading business men and great industrial geniuses, who have risen from the ranks through constant effort and untiring energy. He was almost 70 years old, having been born at West Overton, Westmoreland county, Pa., Dec. 19, 1849, the son of John W. and Elizabeth Overholt Frick. His father was a farmer, while his mother was the daughter of Abraham Overholt, a leading miller and distiller of southwestern Pennsylvania at that time. Mr. Frick's early education was received at West Overton, being a pupil at the common school. He later attended for a short term classes at the Chester Military academy, and for a few months was a student at Otterbein university, Westerville, O. When 14 years old, he obtained work in a store at Mt. Pleasant, Pa., receiving small wages and in 1869 he accepted a more attractive position as bookkeeper in the office of his grandfather at Broad Ford, Pa., where his attention was called to the value of coking-coal properties in that section. He interested a number of friends in these deposits and by combining their money a tract of land was bought and 50 coke ovens built.

In the panic of 1873 the price of coke declined but Mr. Frick did not lose faith in the value of what now are the Connellsville coke regions. After considerable deliberation, he appealed to Judge Thomas Mellon, Pittsburgh, from whom he borrowed $20,000, returned to Mount Pleasant and bought out his partners. He then organized the H. C. Frick Coke Co. Immediately after the panic, coke began to advance by leaps and bounds. Not many years later Mr. Frick owned 40,000 acres of coking coal land and 12,000 ovens in Fayette and Westmoreland counties and employed more than 11,000 miners and operators.

Andrew Carnegie purchased the Frick coking-coal properties in 1882, and retained Mr. Frick as manager. It was the purchase of these properties that brought Mr. Frick into direct contact with the iron and steel industry, and despite the fact that he claimed to know little about the manufacture of steel, he became one of the most influential factors in the steel business of the United States. When Mr. Carnegie temporarily retired in 1889, he appointed Mr. Frick active manager of his interests and, with Henry Phipps, Mr. Frick directed the policies of the company. He served as chairman of the board of the Carnegie Bros. & Co., from 1889 to 1892 and later was chairman of the board of managers of the Carnegie Steel Co. He was in active charge of the Carnegie interests until 1900. Much has been written about the so-called "split" between Mr. Carnegie and Mr. Frick, but little ever was

Railroad Congestion Hits British

Traffic Troubles Eclipse Coal Shortage as Market Factor and Various Iron and Steel Products Are Scarce—Exports at a Standstill—American Discard Steel is Purchased—Tin Plate Strong

The Iron Trade Review Staff Cable

European Headquarters,
THE IRON TRADE REVIEW,
16 Regent Street, S. W. I.,
London, Dec. 1.

CONGESTION of the railroads and the shortage of cars and locomotives is the dominating factor in the British iron and steel industry. All iron and steel products are scarce, especially pig iron, billets and sheet bars. The fuel situation has been confused by government price meddling which has lowered the market on household coal and is threatening to advance it on industrial fuel. Nevertheless coal supplies are larger, but this improvement is offset by the railroad congestion.

Pig iron prices are unchanged generally and very firm. The car shortage is compelling many furnaces to pile iron while the melters are becoming short of supply. Middlesboro pig iron exports for November were 11,300 tons compared with 10,300 tons in October.

Thousands of tons of skelp have been placed with Staffordshire mills at £24 ($96.06), which represents an advance of £1 10s ($6.00) due to the inability of consumers to obtain American material. Brisk demand for Welsh tin plate from the continent is current. There is virtually no exporting of British iron and steel materials at present, except pig iron and tin plate.

Office of THE IRON TRADE REVIEW,
Prince's Chambers, Corporation Street,
Birmingham, Eng., Nov. 14.

Rate of Exchange—4.13¼

CLEVELAND had a little surprise this week in the arrival in the Tees of a cargo of pig iron, understood to be Luxemburg basic iron, coming by way of Antwerp. At the present time the vessel is discharging at Stockton and is to take back a quantity of Cleveland iron to Antwerp. It appears that fair quantities of this Luxemburg iron have been sent to Scotland, and the prices, when freight is added, work out at about the same price as Cleveland iron, plus the railway charges of 10s 8d ($2.40) per ton. The taking of Continental iron into Cleveland is rather like bringing coals to Newcastle, and though the details are not known, it is believed that this is an isolated sale at a cut price, to get rid of surplus stock. The incident emphasizes the great demand for iron, especially basic, and Cleveland makers are not much disturbed, as they have a great many more orders than they can fill. In fact, refusals of business are constant.

Basic is particularly scarce just now and consumers are disposed to criticize the authorities who, they say, have taken off too many furnaces from basic to make foundry iron. If the scarcity of this class of material continues, more Continental importations are considered very likely. The great trouble is coal scarcity, aggravated by the shortage of trucks. All the blast furnaces could handle a great deal more business, if they could get the coal and the trucks. It appears that railway trucks are coming back from the Continent at the rate of several hundred a week, and it is hoped that this will gradually reduce the railway difficulties. But already the rigors of an early winter, with their usual effect in hampering transport are being experienced.

A lot of foreign business is held up by the confusion over prices. Foreign buyers, especially, dislike the clause requiring them to pay for any increase in railway rates, and they are disposed only to do business on a fixed basis. Consequently, foreign trade is badly hampered, while the rate of exchange tells very heavily against Italy, France, and Belgium, who will not be good customers until the financial situation has greatly improved.

Business in the Midlands is on a strictly moderate scale. Derbyshire and Northamptonshire prices for forge iron are slightly easier. This is in consequence of a few purchases from Cleveland, where an undue proportion of low quality forge is being turned out by the furnaces, chiefly as the result of the inferior fuel. Some of the northern furnaces are getting rather heavy stocks of forge material. The chief factor discouraging business is the uncertainty as to railway rates and the future price of coal. The authorities have announced that a reduction in the price of coal is pending, but no definite decision has been reached. The Midland furnacemen are not greatly disturbed by the importations from Cleveland, as the quality in that district is not very suitable for Midland purposes. The molders' strike still continues, the men being dissatisfied with the arbitrator's recent award of 5s ($1.03) per week. It is remarkable that the demand for foundry material has scarcely been affected, as iron founders everywhere are buying foundry iron wherever possible, and putting it into stock.

At the Birmingham meeting yesterday there was plenty of new business in steel on offer but makers are accepting orders very cautiously, in view of the impossibility of estimating their costs. When the new price of coal and the alterations in railway rates are known, the whole list of finished material prices will be revised. The high price of coal and its great scar-

city are injuring the trade, causing frequent stoppages of production in the Black country.

A peculiar shipment of American steel this week has attracted some attention. One merchant was offered 2000 tons of billets at £10 ($41.20) which he promptly accepted, and another merchant is negotiating for 5000 tons. One cargo of this steel is reported to have already reached a British port. The term billet appears to be rather a misnomer, as the metal is described by the buyers as discard steel. The sizes are irregular and some of the cuttings will be too bulky for use in any mill accustomed to deal with billets. Moreover, the quality has a very limited range of usefulness. The buyers intend to use it for fencing hoops, builders' hoops, and for reinforced concrete purposes, for which there is a very good demand. The present British prices range between £15 ($62.24) and £16 ($66.36).

The molders' strike is beginning to affect the steel trade very seriously. Many of the steel mills cannot go on much longer without renewals of rolls which come from the heavy iron foundries now on strike. Engineering works in all directions are reducing their production daily for lack of castings. The fading of the American steel strike has been quickly followed by a renewal of quotations for American bars. Some American houses are quoting for next quarter's delivery at £19 17s 6d ($81.19) c.i.f., an advance of about 7s 6d ($1.53) on their former terms. Adding transport charges from the port, the price comes out at about £20 17s 6d ($86) delivered in the Black country. Some offers of Belgian material have been made for which £21 ($86.52) would about cover delivery. These prices take no account of rates of exchange, and it is clear that this business would only be possible where delivery is urgently needed.

Although prices in many branches remain nominal, manufacturers find no difficulty in getting advances. Some users of billets who bought very favorably some time ago have had to pay increased charges on their contracts, bringing the value of the billets practically up to the present figure, as they found this was the only way of getting deliveries.

The tin plate boom in South Wales continues, enabling makers to add a further shilling to the price, making the selling figure 45s 6d ($9.31), as against 44s 6d ($9.24) a week ago and 14s $2.88) before the war. The Welsh makers are overwhelmed with orders, chiefly from the Far East and the Continent, where it has been found impossible to obtain American deliveries on current contracts. Galvanized sheets are dearer, orders having been placed this week at the high figure of £37 ($148.44), a rise of 2s ($0.41) on last week's quotation. For galvanized sheets, as for tin plate, the demand is such that buyers are inclined to place contracts regardless of price.

Priority Revived for Fuel Distribution

Washington, Dec. 2. (By Wire)—The central coal committee at a meeting with the beehive coke producers has decided to curtail production of coal for beehive coke ovens on an average of 25 per cent for all regions. Specific averages for the different beehive coke regions are to be given out later. The estimated output in the Connellsville region is to be cut approximately 65,000 tons weekly as a result of this decision. By-product coke output is not affected since no action on this production has been determined upon as yet. The decision is made applicable to beehive rather than by-product coke because the former production is wasteful while the latter affords a supply of by-products for other industries.

WASHINGTON, Dec. 1.—Fuel Administrator Harry A. Garfield today declared that "as far as practicable until the conditions warrant a change, the distribution of coal will be limited to the first five classes of the priority list," which was promulgated by him Oct. 31. Steel industries and other manufacturers, including coke ovens, are not among first five classes except where engaged in production of materials for war, navy and other government departments, which are second on the priority list. This means that the railroad administration will not supply coal to steel and coke industries except where manufacturers' requests are approved by the government department acting as a party to the contract.

Steel manufacturers have been having trouble in getting coal and unless output of mines increases this week and continues so that production approaches normal, there is no hope in sight.

Mine Situation is Cloudy

Only meager reports have been received today as indicating activities at the mines following the strike negotiations here last week and these reports are so scattered as to leave no clear idea of what if any improvement is being made. Manufacturers in the east where coal supply is said to have been better than elsewhere during the strike, report dwindling supplies and except for the production of steel for the government, mills likely will be forced greatly to curtail operations if not to shut down entirely.

Mr. Garfield's statement while not actually in the form of an order so places the burden upon the railroad administration that it has the effect of an order. The statement follows in full:

Since it is necessary that coal shall be used only for essential purposes, public utilities consuming coal should discontinue to furnish power, heat and light to nonessential industries and should only consume sufficient coal to produce enough light, power and heat to meet the actual urgent needs of the people. Advertising signs and displays of various kinds necessitating the use of coal should be curtailed and no coal should be distributed for such purposes. Pursuant to this policy I have requested the railroad administration in the distribution of coal now or hereafter in its possession to limit distribution to these essential and urgent uses, as far as practicable and until the conditions warrant a change, the distribution of coal will be limited to the first five classes of the priority list. Retail dealers who distribute coal for household requirements, hotels, buildings, hospitals, etc., should take every precaution to see that coal only is delivered where it is absolutely required and then only in such limited quantities that the supply may be distributed widely and prevent suffering.

The state and other local authorities can materially aid in inspecting and supervising such distribution by retail dealers and the United States government will be glad to leave the supervision and control of such distribution by retail dealers entirely to any state, county or municipality which may make provision therefore. The distribution to the retail dealers must necessarily be administered by the railroad administration in pursuance of the orders already made by the United States Fuel Administration in carrying out the priorities which have been prescribed under the Lever act.

Pig Iron Output Gains Rapidly

November Blast Furnace Statistics Show 35 Stacks Were Relighted During the Month, 30 of Which Were Steel Works Furnaces—Daily Production Shows Increase of 32 Per Cent

PRODUCTION of coke and anthracite pig iron, which was seriously retarded by the recent steel strike, is climbing to its normal output rapidly as shown by the blast furnace figures compiled for November. Although the total tonnage and the average daily tonnage fall below

AVERAGE DAILY PRODUCTION

	1919	1918	1917	1916	1915
Jan.	106,654	77,523	101,930	102,319	51,323
Feb.	105,270	82,794	94,641	106,157	59,521
March	99,614	103,548	105,026	107,343	66,009
April	82,479	109,112	110,936	107,517	70,484
May	67,991	111,351	110,119	108,535	72,747
June	70,467	110,538	108,675	107,127	78,998
July	78,200	109,954	107,659	103,907	82,687
Aug.	88,453	108,983	104,483	103,156	89,510
Sept.	82,692	113,774	104,691	106,935	94,478
Oct.	60,142	112,335	106,332	113,167	100,656
Nov.	79,377	111,595	106,620	110,593	101,174
Dec.	.....	110,602	93,077	102,715	103,278
Av.	83,758	105,293	104,562	106,610	81,022

the same figures for August and September, which was a highly productive month in spite of strike disturbances during the last few days, the rapid recovery is marked by the fact that at the close of November 251 stacks were in blast, only 15 less than were in blast on Aug. 31.

The total output in November was 2,381,327 gross tons, a gain of 516,903 tons over the October figure of 1,864,424 tons. Reduced to a daily basis, 79,377 tons was the average per day during November while the previous month averaged only 60,140 tons. The difference is 19,237 tons. The gain of November represents 32 per cent, thus carrying the figure to a safe distance from the October average which was the lowest since February, 1915. With this rate of gain indicated production during the present month should easily pass the September figure and possibly the August total but it is feared that the coal strike may offer complications.

Steel works or nonmerchant stacks produced a total of 1,716,448 tons compared with 1,269,667 tons in October, the gain being 446,781 tons. On a daily basis, the November output shows an average of 57,214 tons per day, 16,257 tons greater than the October average of 40,957 tons. The gain in steel works pig iron capacity amounted to 39.7 per cent and is indicative of the rate at which the steel industry recuperated. Merchant production after better than holding its own during October showed improvement during November. The merchant output was 644,189 tons, an increase of 69,670 tons over October production of 574,519 tons. The average daily output was 21,473 tons compared with 18,533 tons during the previous month. The gain was 2940 tons and amounted to 15.9 per cent.

Active stacks in blast on Nov. 30 numbered 251, a gain of 35 stacks over the 216 in blast on Oct. 31. Again significant of the recuperation of the steel industry is the fact that 30 stacks of the total gain were steel works stacks. Thirty-two stacks of this class were blown in and only two were put out of blast, making a net gain of 30. Of the merchant class, nine stacks were blown in and four were blown out or banked, making a net gain of five.

Spiegeleisen production with 4500 tons shows a loss of 574 tons from the 5074 tons made in October. Ferro production, however, showed an improvement, the November total being 16,190 tons, a gain of 1026 tons over the October figure of 15,164 tons.

Death of H. C. Frick

(*Concluded from Page* 1501)

known of the exact nature of the differences between these two business masters. It appears, however, that they were too unlike in business aims, methods and ideas, to be associates for a great length of time, and reports indicate that Mr. Frick left the company when it was reorganized. Apparently realizing he was in a position to wield considerable financial power, Mr. Frick negotiated to buy out Mr. Carnegie, from whom he obtained a 90-day option. He failed, however, having been unsuccessful in securing the necessary funds to complete the purchase. Mr. Frick later appealed to J. P. Morgan, who with a number of associates finally bought out Mr. Carnegie and merged the Carnegie Steel Co. with the United States Steel Corp.

At the time of Mr. Frick's death, he was a director of the Steel corporation having served in this capacity since the organization of that enterprise. Likewise he was a member of the finance committee, the controlling body of the Steel corporation management.

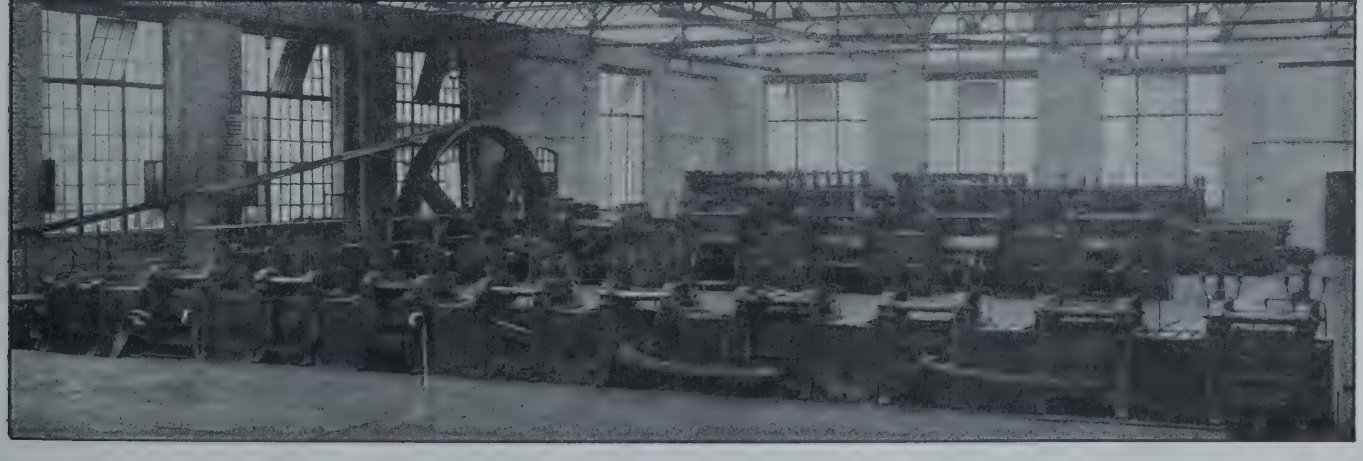
Fuel Rules Foreign Steelmaking

Basic Bessemer Process Generally Employed Because of Cost of Fuel and Lack of Sufficient Amount of Scrap for Open Hearth—Electric Drive Favored Except for Blooming Mills

IN THE accompanying article, which is the third of a series based upon information found in the report of the commission appointed by the British minister of munitions to visit steel works in France, Belgium, Luxemburg and Germany, gives an idea of the present development of the steelmaking and rolling equipment of the iron and steel industry in those countries. The entire report was summarized in the Sept. 18 issue of THE IRON TRADE REVIEW, *following the receipt of the first copy of the report to reach this country. The second article, which analyzed German iron practice appeared in the Oct. 23 issue.*

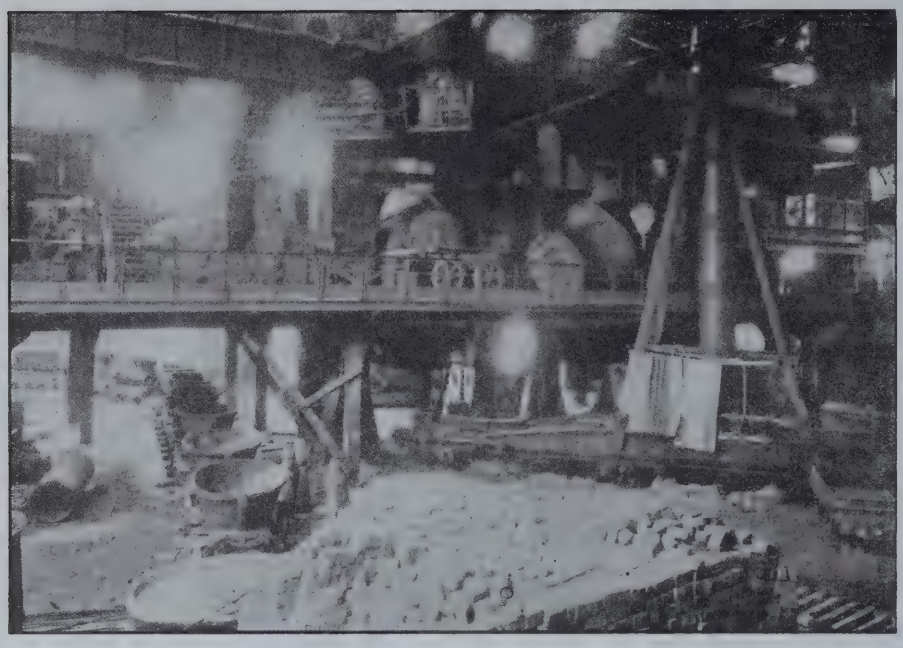
The most noticeable difference between steel practice in the districts visited by the commission and that in the United States, is in the melting process employed. In Europe most of the plants are of the basic Bessemer type, while in this country the open-hearth furnace predominates. Although steelmakers claim that with the ore available and under the conditions existing in Europe, the basic Bessemer process is preferable, still a slight tendency to adopt the open-hearth was noticeable during the war. The fact that the steel output of Germany and England exceeded the production of pig iron in those countries in 1914 and 1916, respectively, a development which took place in the United States as early as 1911, indicates that there is a tendency to use more scrap and that open-hearth is used more extensively than before. Germany, it is pointed out, may adopt the open hearth process more generally.

The rolling mills in the districts visited seem to be well laid out and equipped with modern machinery. In most cases the electric drive seems to be used for roughing and finishing mill rolls but in only a few cases have electric motors been applied to blooming mills.



THAT the basic bessemer process of steelmaking predominates in Europe is clearly indicated by the fact that of the more than 200 steel furnaces in plants visited, 123 were basic-lined bessemer convertors. Of the remainder, 67 were basic-lined open hearths, three were acid-lined open hearths and about a dozen were electric furnaces. In the Lorraine and Saar valley districts, the ratio of converters to open-hearth furnaces was 54 to 25, while in the Cologne district of Germany only 10 bessemer units were mentioned as compared with 23 open hearths. In Luxemburg, including Longwy, 30 converters and 10 open hearths were noted. Almost the same relation existed in Belgium where the count was 28 bessemer and 12 open-hearth furnaces.

From this information it is evident that in the Lorraine, Luxemburg and Belgium districts, the basic bessemer process is firmly intrenched, but that in the limited area visited in Germany, the open hearth seems to find favor. In one of the plants near Cologne, four 80-ton tilting basic open hearth units were installed during the war. This, coupled with the fact that the only acid furnaces noticed by the commission were in this district, gives rise to the question as to whether or not Germany is on the verge of more generally adopting the open hearth process. It will be remembered that soon after bessemer practice began to decline in America, the annual output of steel increased and in five years passed the output of pig iron. In Germany, this change took place in 1914, as shown in the chart appearing elsewhere in this article.



Several reasons are advanced by European steelmakers for the large proportion of bessemer converters employed. It is pointed out that with the present practice in Lorraine, the average number of blows per 12-hour shift is 30 whereas the normal number of heats from an open hearth is three or four per day of 24 hours. The high cost of producer gas and the absence of scrap are factors which also influence steelmakers in their choice of methods.

Where open hearth steel furnaces are installed they work with charges containing 75 to 80 per cent of scrap and 25 to 20 per cent of pig iron. Moreover, they attempt to get three or four, and even five tappings per 24 hours, all of which conditions, compare favorably with the average English practice.

The bessemer plant at the Burbach Steel works, near Saarbucken, is typical of those in the Lorraine-Saar valley district. The equipment consists of three 150-ton mixers and five 25-ton converters. At the present time these units are being operated

GUIDE MILL WHICH IS TYPICAL OF LUXEMBURG PRACTICE. THE ROUGHING TRAIN CONSISTS OF FOUR STANDS OF ROLLS AND THE FINISHING TRAIN NINE STANDS OF ROLLS

slowly, 30 minutes being taken for the fore blow and 1½ minutes for the after blow. A tar-fired furnace and a 5-ton electric furnace are employed for melting ferromanganese. The converters are blown by a 4200-horsepower Nurnberg engine capable of blowing up to three atmospheres per square inch.

Use Anthracite in Ladle

With the object of saving as much ferromanganese as possible during the war, about 50 pounds of anthracite was added to the steel ladle after the bottom had been covered with steel. After reaction had subsided and the metal deoxidized the manganese was added. It is stated that 18 per cent of ferromanganese was saved by this expedient. At the present time a mixture of ferromanganese and spiegel is used, the mixture containing about 20 per cent of manganese.

At the Adolf Emil Hutte works, Esch-Beles, Luxemburg, the following reasons were given for the preference of the basic bessemer prices in continental Europe: First, the amount of gas required in open-hearth furnaces necessitates larger quantities of coal being transported long distances by rail; second, the number of men per ton of steel made is greater; and third, the Lorraine ore is sufficiently high in phosphorus to furnish the necessary heat in blowing and to yield a marketable slag for fertilizing purposes.

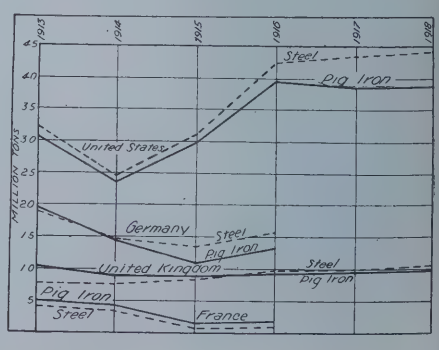
In one German works visited by the commission all of the steel was being made in fixed open-hearth furnaces. The equipment of this plant consists of three 15-ton acid-lined units; and one 50-ton, four 40-ton, one 30-ton and three 15-ton basic furnaces. The pig iron comes from furnaces at Wissen, on the Sieg, and contains about 1 per cent of manganese and from 0.2 to 0.3 per cent of phosphorus. The charge for the larger furnace consists of 70 per cent scrap, 25 per cent pig iron and 5 per cent iron containing from 2 to 6 per cent manganese. The number of charges per furnace in a week of six full working days varies between 20 and 24. Two men are employed on the charging side and one man on the tapping side of each pair of furnaces.

Open Hearth Used for H. E. Shell Steel

According to the report of the commission, there is but little doubt that nearly all of the high explosive shell steel was made in open-hearth furnaces and that basic bessemer steel was rolled down for sections, light rails, wire rods, reinforcement bars and other materials used in the field. It was said that the Burbach plant was the only one in which satisfactory steel rounds for high explosive shells were made from basic bessemer steel without a heavy percentage of rejections. At Volklingen in the Saar valley three small basic open-hearth furnaces were erected during the war for the express purpose of making high explosive shell steel. About 1000 tons per week were produced.

It is possible that the wartime use of the open hearth process may exert some influence in the selection of steelmaking units for new plants. The extensions contemplated at the steel works at Rombas, France, include one 1200-ton and one 500-ton mixer, six 30-ton converters and four 60-ton tilting open-hearth furnaces. Another new open hearth melting plant is under construction at Neunkirchen near Saarbrucken. The three 35-ton furnaces in this works are now nearing completion. They were specially designed by the works engineers and will be operated on gas from nine Poetter-type producers.

Electric Furnaces Built During War



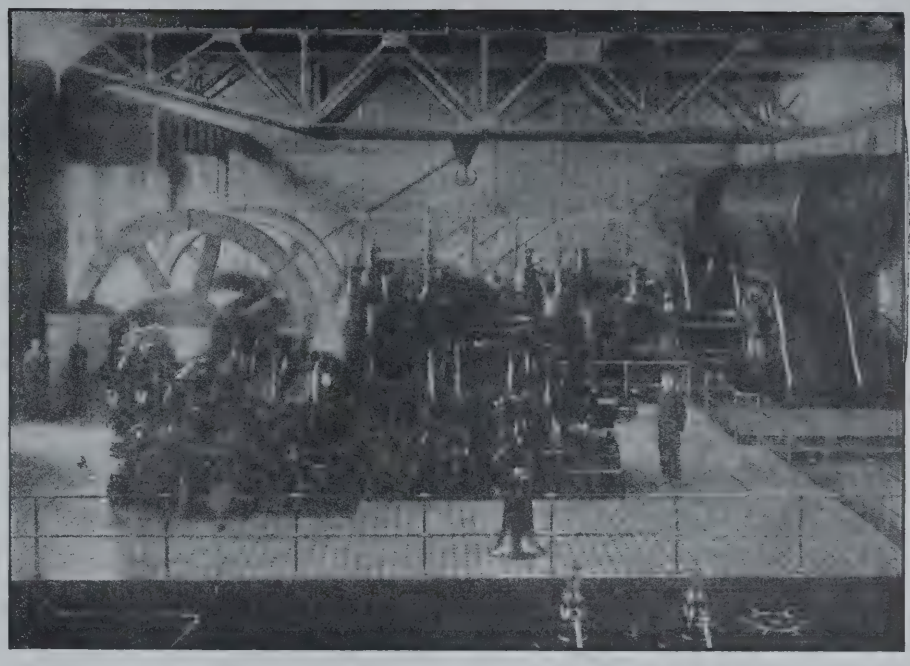
Comparatively few electric furnaces were noticed by the commission in comparison with other types. In several instances, electric units were installed during the war for the purpose of making steel for high explosive shells. One of these, a 12-ton furnace at Neunkirchen, averaged 60 tons per 24 hours and during 1918 produced about 15,000 tons of this material. Molten converter steel was charged in this furnace.

The electric steel equipment at the Thyssen works, Hagondange, Lorraine, in addition to a small unit for

Steel Output Overtake

ACCORDING to the accompanying chart, which was plotted from the figures shown in the table the steel output overtook and passed the output of pig iron in Germany in 1914. *In* 1916 *the same change took place in England, while in France during a four-year period the production of pig iron exceeded that of steel by a fairly uniform margin.*

These comparisons are interesting in that the changes which took place in Germany in 1914 *and the United Kingdom in* 1916 *correspond to the experience of the American steel industry in* 1911, *when the annual steel output first surpassed that of pig iron. It is quite probable that the rapid development of the open-hearth furnace, with the accompanying increased use of scrap, caused the change to occur earlier in the United States than in Europe.*



COMPARISON OF IRON AND STEEL OUPUT

melting ferromanganese, consists of one 10-ton and one 15-ton heroult furnace. The large furnace is arranged to handle metal from either the converter or open-hearth plants, a plan similar to that employed by the Illinois Steel Co. at South Chicago. The time of working the charge was said to be 90 minutes with a current consumption of 200 units per ton.

Crucible Process Discontinued

Indications point to the fact that in the districts visited, electric furnaces are fast superseding crucible furnaces in the manufacture of tool steel. At the plant of the Arbed company, Dommeldange, Luxemburg, basic pig iron is first melted in two open hearth tilting furnaces of the Wellman-type and the metal is transferred to four 3½-ton Rochling-Rodenhauser electric furnaces. Special steels are made for castings and for ingots, which afterwards are forged to various sizes of tool steel.

The Stahlwerk Becker Co., Willich, Germany, specialists in making alloy, high quality carbon steel, high-speed tools, ball bearings and thin armor plate has discontinued the manufacture of crucible steel and now is employing the electric furnace. Most of the ingots are group cast from the bottom, but for the best steels top casting is adopted, the molds having the wide end up and a "dozzle" being introduced when the mold is nearly full. These molds are circular in section and the skins of all the ingots are turned off in lathes before rolling or forging. Most of the ingots weigh about 200 pounds.

COMPOUND, GAS-DRIVEN BLOWING ENGINES WHICH SUPPLY THE AIR FOR THE BLAST FURNACES AT A LARGE BELGIAN PLANT

Rolling Mills Well Arranged

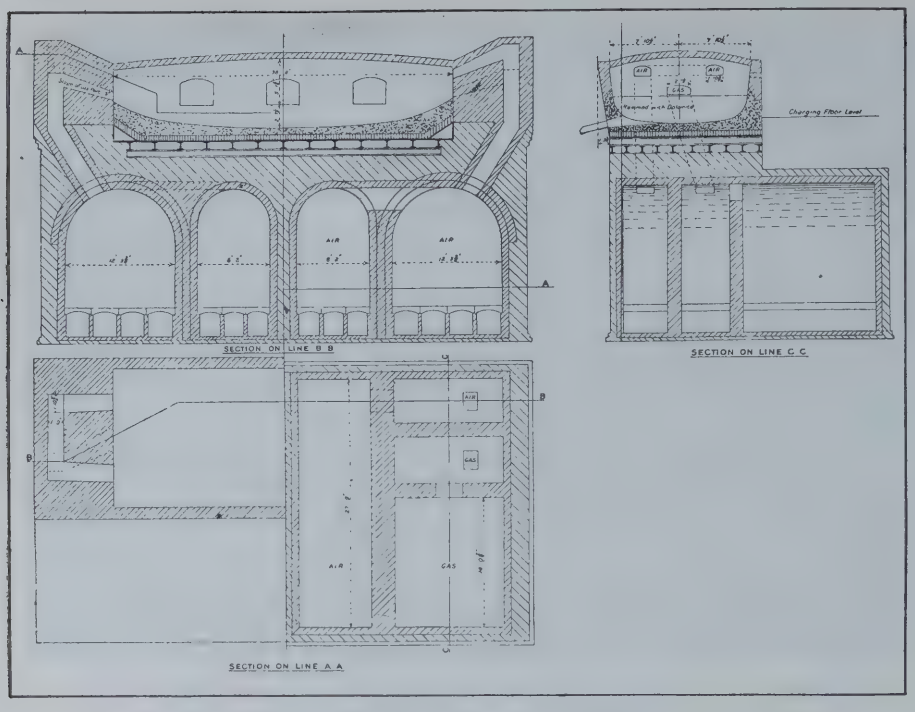
According to the report, the layout and equipment in nearly all the steel works are excellent. Many useful devices were seen and some of the mills are very economical and give large outputs. Electrical cranes and labor saving devices are employed wherever possible.

Duplicate mills have been installed in many plants to insure that time is not lost while changing rolls. Some cogging mills are provided with duplicate drive, to preserve the continuity of work in case of one engine breaks down at any time, and also to secure regularity of output in the bessemer shop, where there are many unheated soaking pits, which are only suitable for a continuous and regular flow of hot ingots from the bessemer shop to the blooming mills.

Those rolling mills which are steam driven are nearly all equipped with reversing and continuous running compound engines, and the most modern reversing engines are three crank.

The mechanical appliances for handling the piece at the cogging mill were practically identical at all works and consist of long heavy moving guides operated simultaneously on both sides of the rolls, each guide being kept in alignment with its fellow guide on the opposite side of the mill. On the side nearest the soaking pits one guide is provided with tilting fingers for turning the bloom over. The advantage of this arrangement over the ordinary type of manipulator found in England is that the bloom is kept straight the whole time during rolling, the guides being worked so close to the piece that bending towards the cooler side in the case of an ingot unevenly heated is impossible. As a result, cogging is performed rapidly while the piece is at a good heat, with a corresponding reduction in the power required per ton of output. A similar manipulator has just been built by Davy Bros., Sheffield, for a new cogging mill in the north of England, and will be the first of its type to be used in the United Kingdom.

Cranes Used Extensively



The mill housings are of heavy construction and modern appliances are installed for satisfactory economical finishing of products, including modified Morgan hot banks, straightening, sawing and shearing machines. Overhead cranes are provided over hot banks, and extend out over the covered stock yard and open stock yard beyond, so as to obviate unnecessary handling. This reduces handling costs.

Lead Held by Pig Iron

PRODUCTION OF PIG IRON AND STEEL

Year		Pig iron	Steel

1918	United States	38,500,000	44,000,000
	United Kingdom	9,782,525	10,411,801

In Lorraine, Belgium, Luxemburg and Germany basic bessemer furnaces are used more extensively than open-hearth units because of the high cost of imported fuel and the absence of scrap iron and steel. Where basic open-hearth furnaces have been installed, the output is small compared with that of the basic converters and the works depend largely upon local mill scrap for the necessary charges. In Germany, however, open-hearth plants were more in evidence. The commission reports that open hearth steel seemed to be used for high explosive shell steel because rejections were excessive when the rounds were made from bessemer metal.

SECTIONAL VIEW OF A TYPICAL OPEN-HEARTH FURNACE IN THE SAAR VALLEY

In most of the mills which have been installed recently the electric drives having been provided for practically all of the roughing and finishing mills. Where this practice is followed, it is customary to run one or a number of turbo generators parallel with the gas engines for generalization of power on account of the great flexibility of the turbine and its capacity for taking varying peak loads more readily. At Hagondange 36.45 per cent of the total generating capacity is by turbo-generator which, according to the report, is a fact tending to confirm the opinion expressed at other works visited, that electric drive for large reversing mills, particularly blooming mills, is not as economical in practice as in theory.

Steam engines were seldom seen except in connection with blooming and heavy section mills. Wherever they are used, however, surplus blast furnace gas is generally utilized to generate the steam in the boilers which are installed in connection with these rolling mill engines. In a few cases hand-fired Lancashire boilers were seen.

The larger part of the production of mills in the Lorraine and Saar valley districts consists of ordinary merchant steel sold without guarantee or test. The production includes plates, sheets, light and heavy rails, steel sleepers, hoops, wire rods, joists, channels, tees, angles, flats, bars, etc. The number of plate mills is comparatively small. A new tin plate mill under construction at Dillingen was all but completed at the time of the commission's visit. All the material is cold straightened before being placed in stock, no extra charge being made for this service. Apparently the steel works execute from stock a large number of orders which they receive, by this means insuring prompt delivery to their customers and eliminating the merchant. Acting as their own warehousemen they can readily execute orders for any number or size, presumably securing the merchant's profit for themselves.

It is pointed out that in England steel making and stock hold are separate branches of the business but that in Lorraine especially they are carried on by the same concern and judging from the large stock held the combination appears to be regarded as profitable.

Nearly every place visited has a slag brick works. The bricks are made in machine presses, each press producing about 10,000 ordinary bricks per day. The slag is granulated by being run while molten into water. About 5 per cent of lime is added to this granulated slag to act as a binder, and the mixture remains for 24 hours before being pressed. After pressing the bricks are simply air-dried. They are in large demand in the district for building purposes. Before the war the sale price at the works was about 18 to 20 marks per 1000; while today it is 60 to 65 francs per 1000. Some of the steel works have a slag cement works attached.

Hints on Packing

Manufacturers and exporters to the Near East will be interested in the following remarks submitted by Major Kennard, the Federation of British Industries commissioner for the Near East, in connection with the packing of goods exported to that district.

There are always a certain number of tin plates to the box according to size and weight of sheets ordered. These boxes are invariably thin. Owing to the weight of the contents

they usually arrive broken, and it is not unusual for them to be discharged loose, which leads to damage often and to pilfering invariably. It cannot be too strongly recommended that these boxes be iron-hooped. The extra charge for iron-hooping should be quoted originally and charged on invoice, or, better still, should invariably be allowed for when c.i.f. price is quoted.

The usual packing of bedsteads by British makers is satisfactory. It is most important, however, to note that all brass parts should be removed from the bedsteads and packed in separate cases, for if the brass parts are attached to the beds, entry dues (which are governed by weight) are charged on the full weight of the bedsteads at the full rate for brass, which is much higher than that for iron. Thus a saving is effected in handling quantities of these goods.

Workmen Demanding Self-Expression

BY CYRUS McCORMICK JR.

IT HAS been suggested that the difficulties under which employers and employes are operating are due to the nervous tension resulting from the war; to the high cost of living; to the fear of unemployment; to insufficient wages; to desire to share in the profits of industry; to a revolt against the old order of things whatever that may have been, etc. Each critic has, however, been more or less in agreement that the war taught nations once and for all time that individual workmen must be regarded as human beings.

In agreement with many critics of the present industrial situation, I believe that the most significant feature in labor conditions of the day is the expressed desire of labor to share in the management of business. This desire has taken on various forms in different parts of the world. In Russia we see it as Bolshevism, which is nothing more or less than a practical application of the doctrines put forth some years ago by the I. W. W. in this country.

It has been said that 65 per cent of the strikes which have taken place in Central Europe since the war are of purely syndicalist origin. In this country we have had demand after demand cataloged generally under the term of "better conditions." In England we have seen a complete disruption of industry from which has grown up the so-called Whitley plan and, more recently, the ever-widening clamor for nationalization of industry.

The underlying significance of all these movements is the final realization that the relations of employers and employes must from now on be formed on something besides a cash basis. The workman is as interested as ever in his wages and in his hours, but he is asking for more. Sometimes the demands are not well understood even by those putting them forward. What the workman really wants is self-expression. They are asking the right to discuss and adjust matters affecting their own interests.

Many employers in this country, sensing this situation, are admitting the right of their employes to discuss in joint conference, matters affecting the mutual interests of capital and labor. This, of course, has involved a recognition of the principle of collective bargaining. Economists of the older school tell us that collective bargaining is detrimental to the best interests of the employes and that any artificial interference with wages will result in an artificial attempt to regulate prices. They claim that values are regulated by economic laws. This, of course, is true to a certain extent, but on the other hand it can be argued that collective bargaining is an aid to humanity and that it allows other economic laws to operate which might otherwise be held in abeyance.

Favor Collective Bargaining

Not many years ago the doctrine of *caveat emptor* ruled every economic transaction and the business world was permeated with the ethics of David Harum. Just as that doctrine has vanished, so now is vanishing the fear of collective bargaining, and we find ourselves not only admitting the right of workmen to participate in the determination of working conditions but also discussing how this right may be most surely exercised. The method finding most favor in this country can perhaps best be classified by simply calling it employe representation.

There appear to be four main reasons why employers are seriously considering the adoption of employe representation.

Syndicalism has made such rapid strides in eastern Europe that some men, not recognizing the fundamental solidarity of the American people are afraid that this country is about to deliver itself to bolshevism; therefore they are seeking to head off this unrestrained development and to provide a saner method by which the legitimate desires of the workmen for self-expression may be granted without at the same time completely ruining our present industrial fabric.

There is a close parallel existing between the movement in favor of employe representation and the growth of democratic government.

It is easy to point a finger of scorn at our present civilization and condemn it as being overly materialistic. Metaphysicians from Aristotle to the present day have argued against materialism. Phrasing their thoughts in the vernacular and adapting their theories to modern times we may say that we must find some new cause for our existence beside the worship of the almighty dollar. The joy of doing things rightly will in the end give men a more real satisfaction than the material results of their efforts. Applying metaphysics to employe representation, we may describe it as a concrete effort to introduce moral right into industry.

Looked at superficially, employe representation is expensive. It costs a certain amount of money to pay the added salaries, to do the clerical work involved, and the like; but those employers who have had the best experience say that it is really economical and efficient. They believe it pays; they believe the added interest a man must have in his work when he knows he has a share in the control of it, will go a great way toward bringing about the final efficiency of production which must be secured if the present pace of manufacturing is to be maintained. Scientific management has just one more step to take. It must become endowed with soul in order to become more efficient; and its savings must depend not upon force or will, but upon the consent of the governed. The war has proven that democratic society, while superficially less efficient than autocracy, is in the end far stronger in the face of the most awful competition human ingenuity can devise.

From a paper presented at the eighth annual congress of the National Safety council, Cleveland, Oct. 1. The author, Cyrus McCormick Jr., is works manager of the International Harvester Co., Chicago.

Applying Depreciation Equitably

Depreciation is Operating Expense Which Must be Systematically Handled in Accordance With Preconceived Plan—Present High Costs May Affect Rates on New Industrial Buildings and Equipment

BY D. C. LOWLES

PROBABLY no subject within the limits of modern accounting practice is worthy of more study and capable or more contradictory interpretations than that of depreciation. No item of costs has received greater attention than has this in the last few years and upon no item has there been placed so many varying values.

In general, the items of capital upon which depreciation should be figured can be grouped under three headings: *First,* plant of permanent character including land and buildings, with the usual engineering and legal charges incidental to construction and title; *second,* equipment of all kinds, machinery, tools, appliances, furniture, autos, etc., necessary to production or to business operation; and *third,* capitalized general expenditures such as those for legal expenses, patents, development, plans and processes, that have a continuing value considerably beyond the fiscal period in which they were incurred.

All of these items decline in value as time goes on due to the operation of various causes and it is extremely important therefore that proper provision be made in the operating accounts for such value losses and that all costs properly include a fair proportion of these "value" expenditures.

Is an Operating Expense

Authorities on accounting are very emphatic in maintaining that depreciation is an operating expense. One accounting expert, commenting on this phase of the problem, declares that often statements in published reports show that a corporation has realized net profits amounting to a certain sum, and that out of these profits an allowance for depreciation has been made. It would be just as logical to state that a pig iron manufacturer had earned a net profit of $100,000 and that out of the $100,000 there had been set aside $20,000 to pay for the ore consumed in the manufacture of the product.

It is obvious that the profit or loss of an undertaking for any period cannot be simply the difference between the receipts and expenditures for that period, neither can it be assumed that the current value of plant and equipment will be always equal to the amount expended upon. Depreciation must be considered. There are times of course when entirely extraneous influences may cause fluctuation in the value of fixed assets, but as the actual manufacturing or trading profits are not affected thereby, either way, these fluctuations need not be considered in this connection. Depreciation is altogether distinct from fluctuation and is due to the possession and use of the assets and is therefore part of the cost of operation.

Elements of Depreciation

The principal elements of depreciation follow:

1. Wear and tear due to and varying with the use of the building or equipment. Part of this may be offset by repairs, renewals, etc., but there will always be eventually a diminished efficiency with a consequent decline in value.

2. Physical decay from exposure to the elements, rust or other causes and due often to lack of use or neglect of maintenance and repairs.

3. Accident, usually a very sudden depreciation, in many cases entailing expenditures materially in excess of maintenance and sometimes producing a permanent value loss.

4. Obsolescence caused by improvements in machines and methods necessitating substitution of the plant or equipment with new in order to keep abreast of the times and meet competition.

5. Inadequacy, somewhat allied to obsolescence but due rather to enlargement of business, and increased output, or in the case of motor trucks, freight cars to an increased load requirement.

It is said that obsolescence cannot be foreseen and that any attempt to reduce the contingency to a definite allowance to form part of current costs would defeat its own purpose. A reserve should be created to meet the possibility, but the reserve should be provided for out of profits before stating the surplus applicable to dividends and never as an item of prime cost.

The factors governing the determination of the amount of depreciation include:

1. The cost of asset, whether building, machine, or other item. This may be either the actual cost price or in the case of a transfer of a business or group of assets, its estimated value.

2. Its estimated life, regard being had to its functions and the conditions under which they are performed.

3. The extent and value of repairs and renewals made from time to time.

4. Its value in use or its present earning power, relatively and comparatively, to other like assets used for similar purposes.

5. Its residual value, either as scrap or as an article which, though possibly applicable to other uses, is no longer fit for its original purpose.

Depreciation may be classified as unit depreciation, relating to individual machines, buildings, motor trucks or other units of plant; group depreciation, covering groups of like units such as office furniture, machines of various kinds in one or more groups, permanent tools, trucks, etc.; and composite depreciation which is the resultant effect upon the whole plant of unit or group depreciation. The total depreciation of the plant is therefore the composite depreciation, equal to the sum of the detailed depreciation amounts.

Methods of Applying Depreciation

Absolute accuracy in the determination of depreciation is impossible. The past effects of wear and tear, physical decay, obsolescence and inadequacy can be determined with reasonable accuracy, while the future effects of wear and tear and decay may also be estimated from experience satisfactorily close, and even inadequacy may oftentimes be foreseen, but obsolescence can only be predicted with much uncertainty. Yet given a sufficiently comprehensive grouping of large numbers of plant items the law of averages will apply and it will therefore be possible to establish a reasonable ratio of decline in value.

The methods used in applying depreciation have varied considerabdy, probably the simplest and most easily applied being what is known as the straight line method. This is free from interest or other complications and is simply the application of a standard percentage rate per year to the original or book cost.

A method often used though less frequently is the reducing balance method by which a certain percentage deduction is made from the original cost, each year's percentage being applied to the balance remaining after the previous depreciation amount has been deducted. It is apparent that by this method the asset is never entirely depreciated.

The sinking fund method, which provides for setting aside annual sums of money that will accumulate at compound interest to a certain sum in a given time, is not often used in ordinary business because of the complications involved in the necessary calculations and be-

From a paper presented before a recent meeting of the accounting manager's group, Cleveland chamber of commerce. The author, D. C. Lowles, is auditor, Cleveland Metal Products Co., Cleveland.

cause any kind of a sinking fund is rarely advisable owing to the greater earning power of capital used in the business.

A fourth method and one coming more generally into use for certain classes of equipment is called the unit of production method, by which a certain amount of depreciation is charged off according to the output produced or in the case of autos and trucks according to the miles run or the tonnage carried. Some machines are good for a limited output only and this being known, it is a simple matter to apply the correct depreciation to the product.

There are other methods of depreciation used such as the periodical appraisal, which is good only if the appraisal can be relied upon and if basic values do not fluctuate from one appraisal to another, and the hit and miss method with which all are familiar and which is still in use by many.

Showing Depreciation on the Balance Sheet

Depreciation is usually taken up on the balance sheet by reducing the asset value to show in one figure the net remainder, or by showing the reserve for depreciation as a liability and the asset at full value, or by showing on the asset side, first the full value, then the depreciation deducted as a separate item, with the net asset extended.

All three methods are correct under certain conditions. For all practical purposes it is not necessary to separate the depreciation reserve and where it relates to plant and equipment it is therefore preferably shown by the third method which is standard American practice.

It is when we come to ratio of depreciation that the experts disagree, and this is only natural since every business of industry has its own peculiarities. Even buildings of the same type depreciate differently if used for different purposes and sometimes the rate varies when used for the same purpose but in widely separated localities. Then again land may depreciate rapidly in one place and appreciate in another. Machinery if of standard design and make and readily adaptable to more than one industry has a lower depreciation and a higher second-hand selling value than machinery specially designed for a particular process in one industry and not saleable at all except for scrap. An automobile that is well advertised and made by a large company has a higher second hand value and therefore a lower depreciation rate than an "orphan" or one made by a small company and not well known.

Another factor governing depreciation rates that is of particular importance at this time is that of excess or abnormal costs. It is a question whether a double rate would not be justified in the case of a building for instance which due to abnormal conditions cost far in excess of a reasonable amount. By this I mean the use of a higher rate of depreciation for the first five or 10 years with a normal rate after that time.

Obviously no general rate will apply to buildings as methods of construction, the materials used, the use to which it is to be put, etc., all affect the result. The bureau of internal revenue suggests that the average usable lifetime of a frame building is 25 years, a brick building 35 years, and a stone or steel and concrete building 50 to 100 years. Very few accountants feel safe in adhering strictly to rates based on such averages. While 35 years is a reasonable life for a first class brick building, 25 years seems too long for the average frame structure used for manufacturing purposes, and to project one's imagination 100 years as the estimated life of a steel and concrete building is a difficult task. Generally rates should run on frame buildings about 5 per cent, on brick 3 per cent or where unusual strain or vibration is present not less than 4 per cent, and on the highest type of concrete and steel construction 1½ per cent to 2 per cent.

Equipment varies so materially that no general rate can apply. In the case of machinery for instance so many factors enter into the problem that it seems almost necessary for each machine to carry its own individual rate. The setting of the machine, the solidity of its foundation, the expenditures upon repairs and renewals, the degree of cleanliness and lubrication and the skill of the operator all affect its life and final value. Yet it is not practical, except for very large machines operated as an independent unit, to maintain detailed records and to figure separate depreciation. A grouping for each industry of machines of like kinds and approximately equal life will give entirely satisfactory results.

The rates shown in the accompanying table are indicative only of individual opinion and are subject to all of the variations so far mentioned, and are taken from various authorities. The list obviously is very incomplete, but the individual experience of each manufacturer will readily supply additional information.

Average Rates of Depreciation

	Per cent
Engine, turbines, etc.	3 to 8
Boilers and auxiliaries	3 to 10
Generators	5 to 8
Electrical wiring and cables	4 to 8
Switchboards and instruments	5 to 7
Motors	4 to 8
Piping, steam and water	5 to 7
Light machinery, fast running	7 to 10
Heavy slow moving machinery	5 to 8
Machinery subjected to heavy use, vibration, etc.	10 to 12½
Special machinery for particular processes	10 to 25
Miscellaneous shop appliances and equipment	7 to 10
Dies and special tools (Depending upon the plan followed in charging additional items to this account.)	10 to 20
Furnaces (If all repairs and renewals are charged to operation.)	8 to 15
Motor trucks (Or preferably on a mileage basis as used.)	15 to 25
Automobiles	15 to 25
Wagons	8 to 10
Office machinery, including typewriters, adding machines, etc.	at least 20
Office furniture and fixtures (Or in some cases it is wise to follow the practice of financial institutions and charge all office furniture and equipment to current operation.)	at least 10

Book Review

Development of Iron Ore Into Iron and Steel, by S. C. Dickerhoff Jr.; heavy paper, 15 x 25 inches, price $1, postpaid; blue print, 30 x 50 inches, price $1.50, postpaid; for sale by The Iron Trade Review.

This is an excellent chart which graphically describes the steps in the manufacture of various grades of steel. The author begins with the blast furnace and distributes the product, pig iron, to the open-hearth furnace, the bessemer converter; the electric, puddling and air furnaces; and, the cupola. At this point he discusses the various grades of steel made by each melting process and then outlines the channels into which each particular grade of steel passes for the manufacture of marketable products.

The chart includes a glossary and general notes on pig iron and steel, the latter of which deals with malleable and wrought iron; simple, weld, alloy, ternary, complex, raw, natural, normalized, annealed, hardened, tempered, soft-centered, blister, cold-rolled and high-silicon steels. Under bessemer, electric, open-hearth and crucible steels the numerous products into which these grades of steel are made, are given, followed by practical notes on the individual processes of manufacture. A box in the right-hand corner of the chart includes typical analyses of iron ore, pig iron, wrought iron, billets and sheet bars, tool steel, rails, steel castings, boiler plate and rivet steel, and structural steel for buildings.

Wire is tinned by a process similar to that of hot galvanizing. A method commonly used for preparing wire for tinning is to draw the product with a copper coating, which is made by dissolving blue vitriol in water with a small percentage of free acid. This effects a greater adhesion of the tin.

Studying Strains in Rolling Steel

Economy is Gained by Using Strip as Wide as Possible Consistent With Dimensions of Rolls, Power of Mill and Degree of Uniformity Desired in Thickness of Product

BY ALFRED MUSSO

WHEN a piece of metal is put through the rolls in a rolling mill, its linear dimensions are strained and the whole piece itself is deformed. In other words, the thickness of the piece becomes smaller while its length and width are increased.

Let $ABCD$ in Fig. 1 be the cross-section of a piece of metal as subjected to the pressures P and P_1 normal to the faces shown in cross-section as AB and CD. When the compression is carried beyond the elastic limit of the material, the two faces AB and CD will come closer together as shown by the dotted lines A_1B_1 and C_1D_1, while the two side faces AO and BD will bulge outward as shown by the dotted curved lines A_1C_1 and B_1D_1, and if the forces P and P_1 are still increased the piece ultimately will fail by shearing along its diagonals.

The ultimate behavior of the failing piece is influenced by the structure of the metal itself. In fact, experience shows that ductile metals possessing a homogeneous structure, such as copper, aluminum, etc., will become plastic and flatten down to a disk, while fibrous metals, such as steel, wrought iron, etc., where strength across the grain is much lower than with the grain, are not susceptible of any plastic state at all and will ultimately fail by splitting sideways. However, it is sufficient to regard the piece as shown by Fig. 1 as divided into six pyramids having as a common vertex its pressure center O, and as bases its six faces.

It is obvious that while the compressive forces P and P_1 are tending to telescope into each other along the pressure line PP_1 of the upper and the lower pyramids, the other four pyramids will be pushed outside by the expulsive forces R_1 and R_2 consequently set up by the aforesaid pressures P and P_1. The value of the expulsive forces evidently depends on the two angles AOB and AOC, ordinarily known as the *pressure angle* and the *expulsion angle*, respectively. We will now apply the foregoing considerations to the rolling-mill process, and begin our investigation of the effects of the roll pressure at any point of the surface of the piece.

Fig. 2 represents a cross-section of a

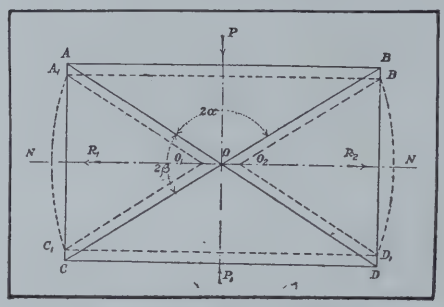

FIG. 1—CROSS-SECTION OF A PIECE OF METAL SUBJECTER TO PRESSURES P AND P

rolling mill through the rolls. NN_1 is the piece of metal going through the rolls C and C_1. Inasmuch as the pressure is exerted radially, it may be considered at any point, say at A, which is the initial point of the contact arc AMB. The pressure P may be resolved into two components, one normal to the piece and the other parallel to its surface, thus $n = P \cos \phi$, normal component and $a = P \sin \phi$, parallel component, ϕ representing the angle ACB, known as the *approach angle*. The directions of the components clearly show that while n is the force which actually compresses the piece, a is the component of the pressure which hinders the piece from entering the rolls, and unless n is larger than a, the rolls will not grip the piece.

The useful limit of ϕ is easily found. The force n is greater than a, and $P \cos \phi$ is greater than $P \sin \phi$. Eliminating P, $\cos \phi$ is greater than $\sin \phi$, and therefore ϕ is less than 45 degrees. The actual value of ϕ for metals is given by $\tan \phi = m$, the coefficient of friction between roll and piece, but for metals m equals approximately 0.577; therefore, ϕ equals $\tan^{-1} 0.577$ or 30 degrees, which according to actual practice is the maximum value of the approach angle for which the rolls will grip the piece.

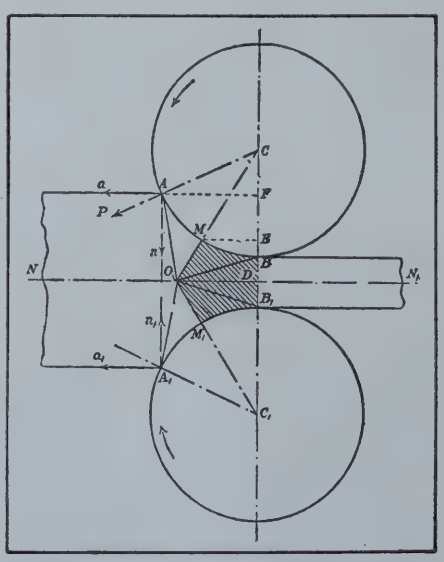

FIG. 2—CROSS-SECTION OF A ROLLING MILL THROUGH THE ROLLS

Let us now deal with the effect of the pressure on the whole arc of contact AB. We may consider the pressure as applied to the middle joint M and the whole piece represented in cross-section by ABB_1A_1 will be divided into pressure pyramids with a common vertex at O. In accordance with previous remarks concerning the behavior of a piece under compression, we deduce that the part of the piece bounded by the contact arcs and shown shaded in the figure is pushed outward by the rolls in the direction of the pass.

To determine, therefore, the elongation of the piece we will proceed as follows:

The area $OMBB_1M_1$ equals the area of the triangle COC_1 minus twice the area sector of CMB; but the area of the triangle $COC_1 = \frac{CC_1 \times OD}{2}$ and the area of the sector CMB = area of circle C / 360 × angle MCB.

In order to symbolize these equations we will use r to denote the radius of the roll; p the pass (BB_1); t the original thickness of the piece (AA_1); and ϕ the approach angle (ACB).

The the area of the triangle COC_1 equals

$$\frac{(2r + p)^2 (t - p)}{8 r \sin \phi}$$

and the area of the sector CMB equals

$$\frac{\pi r^2}{360} \phi$$

The shaded area will be given by $OMBB_1M_1$ equals

$$\frac{(2r + p)^2 (t - p)}{8 r \sin \phi} - \frac{\pi r^2}{360} \phi$$

As we have noted above, this must be equal to the area of a rectangle of height p and base of length l, the value of which latter quantity is given by equation [1] in the accompanying table of formula. The value of the average base l_0 of the shaded area is indicated by equation [2] in the same table.

Presented at the annual meeting of the American Society of Mechanical Engineers, New York, Dec. 2-5. The author, Alfred Musso, is general manager, the Coast Cooling & Engineering Co., New York.

The elongation Δ of the piece will evidently be $l - l_0$, and referring Δ thus found to the total length of the piece gripped by the rolls, we will have the elongation per unit length Δ_1. Also referring to Fig. 2, the total length of the piece gripped by the rolls is as in equation [3]. The percentage of elongation is

$$\frac{100\,\Delta}{r \sin \phi}$$

This equation besides showing the elongation obtained by rolling a piece of metal, furnishes also other valuable information, namely, a check on the safety of the rolling operation, by comparing the $\Delta\%$ with the tensile-strength test of the material in question. In the event that the value of $\Delta\%$ is too large for safely straining the piece, or should it happen to be too conservative, it will always be possible to readjust the pass of the rolling mill to suit, because Δ is a function of ϕ.

In order to find the side spread (σ) of the piece caused by the roll pressure we will refer to Fig. 3, which is a longitudinal cross, section through the rolls. Let CC and C_1C_1 be the axes of the rolls, $AA_1 = t$ the original thickness of the piece, and $BB_1 = p$ the pass. In this case, since the expulsion angles AOA_1 are equal for both sides of the piece, the total spread will be twice the spread of one side.

By reasoning the same as in the case of Fig. 1, we can easily see the amount of side spread is given by the shaded areas, namely, AOA_1 and B_1O_1B. In this case the shaded area is given by the difference of the areas of the triangles AOA_1 and BO_1B_1, which depend upon the value of the pressure angle α because angle $DAO = \alpha/2$. The value of α may be found by returning to Fig. 2 and noting that the angle COD equals angle DBO minus angle OCB. However, tan DBO equals OD/DB and OD equals $(CB + BD)$ tan OCD. Working further and substituting for the angle DBO, and then symbolizing the resulting equation in accordance with the notation already adopted, equation [4], which gives the value of the pressure angle, is obtained.

It should be noted that the pressure angle is also a function of the approach angle ϕ, and once the value of the pressure angle has been calculated it is easy to find, by referring to Fig. 3, the area of the shaded portion, which divided by the pass will give the amount of the side spread σ of the piece. The side spread at each side of the piece is as indicated by equation [5]. If w is the width of the piece, the total spread per unit of width will be 2σ divided by w and the percentage spread will be as shown in equation [6] in the accompanying table of formula. Equation [5] shows that the side spread is independent of the width of the piece, but it depends entirely on the values of the original thickness t and the pass p.

Formula for Rolling Mill Data

ROLLED LENGTH

$$l = \frac{1}{p}\left[\frac{(2r+p)^2(t-p)}{8r\sin\phi} - \frac{\pi r^2}{360}\phi\right] \quad \text{.....[1]}$$

AVERAGE BASE l_0 OF SHADED AREA, FIG. 2

$$l_0 = \tfrac{1}{2}\left[\frac{(2r+p)\ (t-p)}{4\,r\sin\phi} + r\sin\frac{\phi}{2}\right] \quad \text{.....[2]}$$

ELONGATION PER UNIT LENGTH

$$\Delta_1 = \frac{\Delta}{r\sin\phi} \quad \text{.....[3]}$$

PRESSURE ANGLE α

$$\frac{\alpha}{2} = \tan^{-1}\left(\frac{\left[r+\frac{p}{2}\right]\tan\frac{\phi}{2}}{\frac{p}{2}}\right) - \frac{\phi}{2} \quad \text{.....[4]}$$

SIDE SPREAD OF METAL

$$\sigma = \frac{(t^2-p^2)}{p}\tan\frac{\alpha}{2} \quad \text{.....[5]}$$

PERCENTAGE SIDE SPREAD

$$2\sigma\,\% = \frac{200\,\sigma}{w} \quad \text{.....[6]}$$

In conclusion the author wishes to present a practical application of the foregoing formulæ by solving the following problem: In the cold-rolling operation a strip of 0.20 per cent carbon steel is put through a 10-inch mill. The strip before rolling is 2 inches wide and 0.065 inch thick. The pass is 0.050 inch. Find the percentage elongation and side spread.

The first step is to find the approach angle. The fundamental equation of a rolling mill is

$$t = p + 2r(1 - \cos\phi)$$

Solving for ϕ.

$$\cos\phi = 1 - \frac{t-p}{2r}$$

and from the data above

$$\cos\phi = 0.9985$$

or $\phi = 3$ degrees 8 minutes

From the above data and equation [4] $\alpha/2$ equals

$$\tan^{-1}\left(\frac{\left[r+\frac{p}{2}\right]\tan\frac{\phi}{2}}{\frac{p}{2}}\right) - \frac{\phi}{2}$$

$$= \tan^{-1}\left[\frac{5.025 \times \tan\ (1\text{ deg. }34\text{ min.})}{0.025}\right]$$

$= 1$ degree 34 minutes

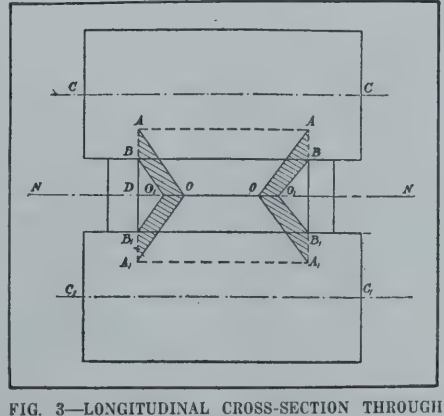

FIG. 3—LONGITUDINAL CROSS-SECTION THROUGH THE ROLLS

$= 78$ degrees 7 minutes

The data in full is as follows:

Roll radius, $r = 5$ in.
Original thickness, $t = 0.065$ in.
Pass, $p = 0.050$ in.
Width of strip, $w = 2$ in.
Approach, $\phi = 3$ degrees 8 minutes $= 3.133$ degrees
$\sin\phi = 0.05466$
$\cos\phi = 0.9985$
$\frac{\phi}{2} = 1$ degree 34 minutes
$\sin\frac{\phi}{2} = 0.02734$
$\frac{\phi}{360} = 0.0087$
Area of roll cross-section, $\pi r^2 = 78.5$ in.^{2}
Pressure angle, $\alpha = 156$ degrees 14 minutes
$\frac{\alpha}{2} = 78$ degrees 7 minutes
$\tan\frac{\alpha}{2} = 4.75219$

To find the elongation, using equations [1], [2] and [3], we obtain

$$l = \frac{1}{0.050}\left[\frac{(10.05)^2 \times (0.015)}{8 \times 5 \times 0.05466} - 0.0087 \times 78.5\right]$$

$= 0.2$ in.

$$l_0 = \frac{1}{2}\left[\frac{10.05 \times 0.015}{4 \times 5 \times 0.05466} + (5 \times 0.02734)\right]$$

$= 0.13725$ in.

and $\Delta = l - l_0 = 0.06275$ in.

or in percentage,

$$\Delta\% = \frac{6.275}{5 \times 0.05466} = 24.6 \text{ per cent of the}$$

original length of the piece gripped by the rolls.

To find the side spread on either side, using Equations [5] and [6] we obtain

$$\sigma = \frac{(0.065)^2 - (0.050)^2}{0.05} \times 4.75219 = 0.164 \text{ in.}$$

The percentage spread is

$$2\,\sigma\% = 16.4 \text{ per cent}$$

The result thus obtained evidently shows that $\sigma\%$ is inversely proportional to w, the width of the piece. Now, because of the fact that in rolling-mills practice we are interested only in obtaining the highest possible value of the elongation Δ, the best economic operative conditions will be furthered by using a strip as wide as possible consistent with the dimensions of the rolls, the power of the mill and above all the degree of uniformity desired in the thickness of the finished strip.

French in Conflict Over Tariff

Comite Des Forges Accused of Conducting Campaign to Erect Barrier Against Cheaper Products From United States—Lorraine Steel Shipped to Germany at Half the Price Government Permits it to be Sold in France

BY FRANCIS MILTOUN
Paris Correspondent of The Iron Trade Review

THE famous Comité des Forges is still in the public eye. Some of tacks upon it are manifestly unfair. In the chaos of the war some powerful institution was needed to take the reins and co-ordinate the efforts of the iron and steel industry, and if the effort was not altogether successful, the actual benefits were appreciable.

The committee now declares that a campaign is being waged to discredit it. It denies that it is seeking to influence the country against foreign products which might be imported at less expense than they can be made in France. Its policy seems to be to supply all that it possibly can for the reconstruction of northern France, and the encouragement of the export of the excess, when there is any needed, which is not yet.

The point is of interest to the American manufacturers of iron and steel for the bearing it may have on the remaking of French tariffs, and it is advisable to watch legislation and also watch for 1919 statistics when they are made public.

If the Comité des Forges goes to pieces it may be to the advantage of American manufacturers. If it holds together, and is able to carry out the economic tariff program, it may mean the closing of the door to American iron and steel.

The various steel works represented in the committee are said to have already received orders from the French bureau of industrial reconstruction for products to the value of 550,000,000 francs.

What is less explicable is how and by what means the government was induced to allow Lorraine steel to come into France only at 60 francs for 100 kilos (220 pounds), whereas the same product is being shipped into occupied Germany at the base price of 30 francs.

"How," writes Gustave Tery, editor of *Work*, "is France to have an export business in steel products if she is to be eternally handicapped by this 30 francs a hundred kilos for raw material from its own mines and furnaces?"

* * *

Rail and Plate Output Increase

The following statistics of iron and steel production in France for the first four months of 1917, 1918 and 1919 are particularly interesting as showing the increase in the output of rails as a result of efforts to get new railroad lines in operation throughout the industrial districts of northern France. The only other line in which production has increased is plates.

	1917	1918	1919
Pig iron, tons.....	235,281	116,059	56,542
Blooms, billets and bars.	550,134	350,498	230,141
Machine steel and iron...	17,348	22,345	7,940
Plates	83,402	57,006	77,550
Iron and steel wire.....	43,942	7,375	14,233
Iron and steel rails.....	38,937	39,372	90,563
Tin plate	13,982	19,479	7,498

* * *

Production of Lorraine Plants

The iron and steel plants concentrated in the region of Metz-Thionville include the following equipment: Sixty-eight blast furnaces, 27 converters, 10 open-hearth furnaces, distributed as follows:

The de Wendel plant at Hayange, Societe des Petits-Fils de Francois de Wendel: Nine blast furnaces of 100 to 200 tons capacity; six converters of 13 tons; four open-hearth furnaces of 30 to 45 tons; rolling mills for sheets and shapes.

Acieries de Wendel at Moyeuvre: Eight blast furnaces of 120 to 190 tons; four converters of 12 tons; rolling mills for shapes.

Acieries Thyssen at Hagondange (German, Stahlwerke Thyssen), Hagondang plant: Six blast furnaces of 300 tons; five converters of 30 tons; two open-hearth furnaces of 60 and 80 tons, rolling mills for shapes. Maizieres plant: Three blast furnaces of 12 tons, not in operation.

Acieries de Rombas (German, Rombacher Huttenwerke), Rombas plant: Six blast furnaces of 200 tons; six converters of 22 tons; four open-hearth furnaces of 20 tons; rolling mills for shapes. Mazieres (Mosellhutte) plant: Four blast furnaces of 180 to 200 tons.

Acieries de Knutange (German, Lothringer Huttund Bergwerks Verein): Ten blast furnaces of 200 tons; six converters of 30 tons; rolling mills for shapes. In this enterprise Belgian interests have 11,000,000 francs of the 72,500,000 capital.

Hauts Fourneaux d'Uckange (German, Gebruder Stumm de Neunkirchen, Sarre): Six blast furnaces of 150 tons.

Hauts Fourneaux de Thionville (German, Gewerkschaft Roechling): Four blast furnaces of 150 tons.

Hauts Fourneaux d'Ottange (German, Deutsch Luxemburgische): Three blast furnaces of 120 tons.

Hauts Fourneaux d'Audun le Tiche (German, Gelsenkirchen): Four blast furnaces of 180 tons.

Hauts Fourneaux de Redange (German, Dillinger Huttenwerke): Three blast furnaces of 100 tons. Forty per cent of the capital of this company is owned by Frenchmen.

The foregoing statistical summary is compiled from "The Reconstituted, North and East," and may be considered as the first official statement as to the working facilities of the region, which with Briey proper forms the kernel of the Lorraine industry.

The *Bulletin des Metaux* gives the production of iron ore in Lorraine for the month of July as 650,000 tons. Shipments from accumulated stocks for the month were 800,000 tons, the stocks on hand at the mines exceeding 1,500,000 tons. France, including Lorraine, consumed 350,000 tons and 200,000 tons were shipped to German plants across the Rhine, while 155,000 tons were consumed by the plants of the Saar and the occupied regions of Germany. The surplus went to Belgium and Germany.

* * *

Prices in France Going Up

La Metallurgie Francaise states that the metal market recently has been considerably affected by the coal shortage. Coal and its transportation dominates the economic situation.

Iron and steel prices in France will soon have to be increased all along the line. The 60 francs per 100 kilos, base, established by the ministry of industrial reconstruction has already given way in many instances to 70 francs, base. This applies to rolling mill output. Thus French plants are seriously handicapped as regards to contiguous competitors. Coke for France now costs 105 francs a ton as compared with the equivalent of 65 francs for plants in Lorraine and in the occupied districts of Germany.

* * *

Foreign Labor in France

In late August a decree was signed regulating the formalities for the introduction of Spanish labor into France, to aid those industrial establishments which demanded a new bureau of immigration. Spanish labor was largely used before the war in Southwestern France, as was Italian labor in Southeastern France, and Belgian in Northeastern France. Of all foreign labor in France the Belgians came first in numbers, the Italians second and the Spaniards third.

Advances Theory on Arc Welding

Investigations Show Electric Current Merely Furnishes Heat in Form of Arc While Welding is Accomplished by Metal Expelled From Electrode in Form of Metallic Vapor—Short Arc is Best

BY RALPH G. HUDSON

Theories Conflict

THERE are many theories as to how the electric current acts in arc welding and how it should be controlled. In the accompanying article, the author presents the results of investigations which seem to show that minute liquid particles are shot from the electrode by the pressure of quickly formed vapors and gases under the intense heat of the arc. The particles striking fluid metal solidify with it but others which strike solid metal bounce off or adhere without fusion. The article is from the October number of the Journal of the American Welding society, the official organ of the American bureau of welding, in which many of the national engineering and scientific societies are represented.

ALTHOUGH metallic arc welding fully for a considerable period had been employed successit was appreciated that its application was based upon empirical methods, and to make greater use of such welding in shipbuilding it was evident that its basic principle should be investigated as thoroughly as possible so that inferior methods of metallic arc welding might be eliminated. The object of this article is to present the results of an investigation of this character conducted in the laboratories of the Massachusetts Institute of Technology by the welding committee of the Emergency Fleet corporation in the summer of 1918.

It should be noted that at the beginning of this investigation no satisfactory explanation had been given for the transmission of metal from electrode to plate. In downward welding the deposition of metal might be attributed to gravitational force but in upward welding no such explanation could be offered. The fact that an electric current is employed in the process suggested the possible existence of forces of electrical origin which might pull metal from the electrode to the plate. Calculations of the magnitude of the electrical forces that may exist during metallic arc welding indicate that they are negligible and may therefore be eliminated as possible causes of the action. This view is further substantiated by the fact that satisfactory welding may be performed with current flowing in either direction or with alternating current and that such differences as may exist with different directions of the current may be explained by consideration of the relative heating properties of such currents at the terminals of an electric arc. In conducting this investigation an attempt was made to obtain a photographic record of successive phases of the welding arc by means of a high-speed motion picture camera. The camera was specially constructed and when set up was found to operate satisfactorily at a rate of 32 pictures per second; the ordinary camera operates at 16 pictures per second. One thousand feet of film were exposed with this camera, the character of the arc being varied by changing the direction of the current, length of arc, type of electrodes, etc. In photographing an electric arc of any kind the luminosity of the arc itself is so great that the other parts of the apparatus including electrode, plate, molten drops, etc., do not appear on the film except as they may appear in silhouette against the arc.

The principal use made of these films was to examine them one by one with a low-power microscope with transmitted light. A systematic examination of 16,000 pictures in this manner disclosed certain important features mentioned later. Although the photographic difficulties were evident, the writer decided to take further magnified pictures of the arc with a short exposure focal plane shutter. A camera was set up which would magnify the arc about eight diameters. Instantaneous photographs of the welding arc obtained with this camera suffered from the same domination of the plate by the arc to the exclusion of all other phenomena.

While focusing this camera it was realized, however, that more could be seen with the eye on the ground glass than could be obtained photographically or by direct observation through dense glasses, and the writer therefore began an extended study of metallic arc phenomena as seen in magnified form on the ground glass. With this device the action of the arc could be examined without screening the eyes and with the further advantages offered by magnification and observation of the action in its true color. When an arc is struck between a steel electrode and a steel plate the end of the electrode and a spot on the plate are heated to a high temperature and metal is transferred from the electrode to the plate. The electrode is heated to a higher temperature than the

FIG. 1—EFFECT OF LENGTH OF ARC UPON SIZE OF ELECTRIC GLOBULE
At the right is globule developed with a very short arc; in the middle with a moderate length arc; and at the left, with a very long arc. These are $\frac{3}{16}$-inch electrodes magnified about 5 diameters

FIG. 2—SURFACE OF AN ELECTRODE ON THE INTERIOR ELECTRODE END OF A LARGE GLOBULE

plate because the heating action of the arc is more concentrated in the case of the electrode and because the heat conduction away from the hot spot is greater in the case of the plate. An analysis of steel electrodes usually reveals the presence of at least 10 elements: Iron, carbon, manganese, copper, sulphur, phosphorus, silicon, oxygen, nitrogen, and hydrogen. Since the melting points and other thermal constants of these elements and their compounds vary widely and their chemical affinities are quite different, it is to be expected that the constituents of an electrode subjected to a high temperature will change from solid to liquid or gaseous form successively and not at the same instant. Since the melting point of iron is higher than that of any other constituent of an electrode with the exception of carbon, which combines rapidly with oxygen at welding temperatures to form carbon monoxide, it is furthermore to be expected that in the welding process the iron constituent of the electrode will melt last.

The thermal changes just described are known to take place during the application of heat to any complex substance. In metallic arc welding the temperature changes which take place differ, however, to a marked degree from the changes incident to the usual methods of heating metals in that a small mass of the electrode in welding is subjected to a high temperature for a very short interval of time. The distinctive thermal feature of metallic arc welding is then the sudden rise and fall of temperature in the metal transmitted to the plate. Under the circumstances it may be seen that the melting of the iron is delayed by the heat absorbed by the other constituents of the electrode and that this fact together with the limited time of application of high temperature disproves the possibility that the iron is completely vaporized in the welding process. When a projectile is fired from a large gun, for example, the initial temperature of the gas behind the projectile is believed to range between 3000 and 4000 degrees Cent. Although this temperature greatly exceeds the melting point of the material of the projectile, there is little evidence of melting on the surface of the projectile because the projectile is not heated by the adjacent gas for a period long enough to melt its surface.

Gases Form in Electrode

An increase of temperature in most materials is accompanied by a marked increase in volume and in chemical changes resulting in the formation of gases the reaction is usually accompanied by an immense change in volume. While various changes in volume may take place among the constituents of the electrode during metallic arc welding, the greatest possibility for such expansion may be found in the formation of carbon monoxide. It is therefore to be expected that a globule will be formed by such expansion on the end of the electrode during welding. Typical electrode globules developed in this manner by various lengths of arc during the welding process are shown in Fig. 1. Each globule contains a cavity which may be seen clearly during welding on the ground glass of the camera described above and is also present in the cold contracted globules shown in the illustration. In the smaller globules the cavities are usually open and resemble small drill holes, while in the larger globules the cavities are usually closed and are surrounded by a thin skin of metal.

An electrode globule maintained in continuous contact with the plate to prevent formation of the glaring arc and heated by a heavy current may be seen under magnification on the ground glass to expand and blow out minute particles at high velocity from the thinnest side walls, a contraction of the globule occurring after each expulsion of particles. The particles appear to originate in the inner electrode surface of the globule. If the globule is suddenly detached and the arc interrupted at the same instant in ordinary long arc welding, the inner electrode surface of the globule presents the appearance shown in Fig. 2. The pitted electrode surface suggests irregular fusion due to different temperatures of fusion, vaporization and chemical combination of the ingredients under the influence of rapid changes in temperature.

Constituents of Vapor Unknown

Owing to the complex structure of the electrode, it is not easy to determine the exact nature of the vapor content of the globule. That the vapor consists partly at least of carbon monoxide gas is suggested by the fact that such globules do not form in general when the end of the electrode is heated in a reducing atmosphere. It is also found impossible to weld with an electrode containing practically no carbon in a reducing atmosphere. In welding under water it was observed that bubbles of gas rise continuously to the surface of the water and burn, indicating the possible dissociation of the water with the absorption of oxygen by the electrode and the rejection of hydrogen to the surface of the water. After a globule has been maintained for several minutes at high temperature in contact with a plate in air, it was observed that all expulsion of particles ceased. It may be inferred from this that all of the vapor forming constituents of the globule had been burnt out.

An examination of the motion picture films which show successive views of the arc, each with 0.0005 second exposure, reveal occasional pro-

FIG. 3—METAL PROJECTED FROM A HOT ELECTRODE TO A COLD PLATE
The incandescent electrode was moved at speed of 4 feet per second over surface of electrically insulated plate. Magnification approximately 6 diameters

tuberances on the electrode globule within the crater region and the paths of projected particles may also be seen silhouetted against the arc itself. That these phenomena are only found at intervals in examining the film is undoubtedly due to the fact that such particles in the arc stream are rendered invisible by the luminosity of the arc and that such protuberances and projectile paths are only visible when they happen to screen the arc. The expelled particles found about the work when welding—the familiar bluish-gray dust of the welding room—or when collected under water are found to be spherical shells indicating that a portion of the vapor within the globule is carried away with the projected particles. A photograph of these projected particles, magnified 20.7 diameters, is shown in Fig. 5.

If the electrode while welding is suddenly swept across an adjacent flat insulated surface, small spots of metal are found on the surface at regular intervals over the surface traversed by the hot electrode. A photograph of a small portion of such a path is shown in Fig. 3, and a more highly magnified view of one of the spots in Fig. 3. The regularity of spacing of these spots when the differences are not magnified is quite striking. The same effect was observed by holding an incandescent electrode, just removed from ordinary welding, over the rim of a revolving iron wheel. It was determined in this way that the average frequency of projection was 50 per second. The duration of such a projection was approximately one-fifth of a second; the projection terminating with the cooling of the electrode.

Particles Expelled by Vapor

It would appear from the observed facts that the metal deposited during metallic arc welding is transmitted in part at least in the form of minute particles which are projected from the electrode globule by the internal expansion of some vapor, possibly carbon monoxide. The expelled particles pass through the arc too rapidly to become vaporized and reach the plate in a fluid state. If the expelled particles strike solid metal they either ricochet along the surface, which explains the accumulation of iron dust in the welding room, or flatten out without fusion, the most common cause of poor welds. If the particles strike a fluid metal they penetrate the fluid and solidify with the molten surface of the plate.

FIG. 4—NUCLEUS OF METAL PROJECTED ON A COLD PLATE FROM INCANDESCENT ELECTRODE

It is a well-established fact that the best welding is obtained with the shortest arc and the worst welding with the longest arc. It will be noted in Fig. 1 that the size of the electrode globule also increases with the length of arc, the best welding being obtained with the smallest globule. A small globule implies greater concentration of projected particles in the direction of the opposite fluid spot. In downward welding a large globule becomes elongated by gravity. The lower part of the hollow globule becomes thickened by downward flowing metal; the side walls become stretched and thinned; and particles are projected wastefully through the side walls at right angles to the arc. The globule as a whole frequently breaks away from the electrode and drops without fusion on the plate. Electrode ends rejected by a welder and presenting the appearance shown in Fig. 2, or of the large globule in Fig. 1, constitute substantial evidence of infective long-arc welding. In upward welding a large globule tends to fall to one side or the other by gravity and prevents the efficient projection of metal.

Any material which serves to increase the melting point of the surface of an electrode must, in accordance with the stated theory, improve the conditions under which particles are projected from the electrode globule. The cup shaped surface formed at the end of such an electrode will reduce the amount of indirect projection of particles to a minimum and the increased stability of the arc will reduce the difficulty of manipulation of the electrode, since the length of the arc may be varied over a greater range without interruption. It appears that most of the coatings suggested for electrodes perform the function of cooling the surface of the electrode by vaporization, and in some instances, owing to the rapidity of the action, remain in a fluid condition about the sides of the electrode globule. It should also be noted that since iron oxide has a higher melting point than steel, rust should not be removed from electrodes and that

FIG. 5—DUST WHICH ACCUMULATES AROUND WORK DURING WELDING. MAGNIFIED ABOUT 19 DIAMETERS

rusty electrodes usually work better than bright clean ones. In many cases the outside layer of bare electrodes may be changed by drawing and heat treatment so that it has a higher melting point than the interior. The ideal electrode would have a high melting point shell, tungsten for example, surrounding a lower melting point interior containing sufficient vapor forming constituents to eject metal constantly when heated by the electric arc.

Recommends Further Study

The writer suggests the following promising subjects for further study: *First*, a determination of the character of the vapor found in an electrode globule; *second*, a determination of the best surface material for electrodes, first cost and effect on the finished weld to be considered; *third*, the effect of welding in a reducing flame upon the character of the weld; *fourth*, an investigation of the value of welding under water as in the case of ships, tanks, etc.; and *fifth*, the use of materials other than steel in metallic arc welding. It will be noted, for example, that the zinc constituent of brass under the influence of a rapid increase in temperature may melt and vaporize before the copper constituent begins to melt. If the theory outlined above is correct, it would appear quite probable that satisfactory welding could be done with brass electrodes.

Foundrymen Hear Talk on Labor Problem

In addition to Eugene S. Willis of the Safety First Supply Co., Pittsburgh, who gave a talk on "Safety First as Applied to the Foundry," members of the Pittsburgh Foundrymen's association at a meeting held

Nov. 18, heard Col. Cameron C. Smith, chairman of the Union Steel Casting Co., Pittsburgh, who during the war served as production manager of the New York district army ordnance office and after the war was a member of the war claims board. Colonel Smith's topic was: "Industrial Unrest; Cause, Effect and Remedy."

Considerable discussion followed Mr. Willis' paper, much of it in connection with the use of goggles and leggings in the foundries. It was brought out that the workmen generally are opposed to wearing goggles at first, but that shop and foundry officials by perseverence can induce the men to see the advantage of this means of protection to the eyes. A plea for leggings that are cooler and more comfortable was made by those who have had experience with the men in the foundries.

Colonel Smith urged fairer treatment by employers of their workmen and traced the causes leading up to the present unrest. Until recently labor was regarded as the "underdog" by the public and enjoyed its sympathy. Public sympathy and political support coupled with thoughtlessness on the part of the employers in their treatment of the men created in the minds of the workmen the belief that they had a greivance and with the backing of the public and the politicians, they could do as they pleased.

Abuses Authority

Power in labor ranks is falling into the hands of irresponsible leaders, who have no respect either for law or for the rights of others and even today, there is a disposition on the part of the public to either wink at or excuse some of the violations of the law by labor. The speaker drew attention to the influence of the radical newspapers, printed both in English and foreign tongues and also the sullenness of labor in obeying the mandate of the courts as in the case of the coal miners' strike.

In offering a remedy for the situation, Colonel Smith drew attention to the lack of confidence of the men in their employers and of the employers in their men. It is his belief that while concessions should be made on both sides, the employers should hold out the olive branch in an effort to effect a reconciliation.

Making the shop an attractive place to work, by the introduction of recreation periods during the day, such as moving pictures during the noon hour, was one suggestion of Colonel Smith, who also favors shop stores where employes may buy necessaries at cost. He also stated that the employment of a trained nurse to look out not only for the welfare of the men but of their families is helpful in making the men more contented.

Getting Together With The Employes

BY A. B. WEEKS

THE clamor by labor organizations for increased wages, shorter hours, better working conditions, collective bargaining, and their attempt at industrial control through recognition of unions, and the closed shop have been especially insistent since the signing of the armistice. Our industries, both great and small, for economic reasons and to increase production have granted one demand after another in the way of wage increase and curtailment of hours, at the behest of labor organizations.

This clamor by organized labor is becoming louder, and the demands more insistent and we have reached that stage in our industrial life where not only our prosperity but our very existence is threatened, at least temporarily, through our disregard of the laws of business economics, particularly as they relate to international trade.

For many years there has been a contest between employers and outside forces, namely the labor unions, for the control of the men in various industrial establishments. Much has been said in meetings of the manufacturers' and employers' organizations of the necessity for a campaign of public education. The writer grants that the necessity for such a campaign exists, but that a campaign of this character would of itself cure the present labor unrest is doubtful. In the writer's opinion the time has arrived for an active campaign for the control of labor by the plant executive. The campaign on the part of labor leaders for the control of labor is so persistent, that the average workman is inclined to accept the teachings of the labor leader and classify the occasional remarks of his employer as "hot air from the boss." If the contest on the part of the labor leader for control is continuous, then employers' efforts must be continuous, collective and persistent.

In the writer's opinion much may be accomplished to gain the confidence and control of our men by closer co-operation with them; by a series of thoroughly organized round-table conferences, regularly held whereby the employer may gain a better understanding of the workman's viewpoint, his necessities, and the conditions surrounding his life, and at the same time show the workman that the matter of wages and hours of work are not governed by the mere arbitrary ruling of the "boss," but are, on the other hand, governed by the economic laws which control our national and international trade relations.

The average workman is an intelligent, fair-minded, and patriotic citizen, and by instructing him in the fundamentals of the natural economic laws governing industry, his viewpoint toward wages, hours of labor and production will be changed through his ability to analyze cause and effect. And in place of the present misunderstanding and unreasonable demands we shall soon have co-operation and harmonious relations, without the intervention of labor unions.

Cannot the employers get together along these lines and effect a solution of our present vexing labor questions? This lack of co-operation and understanding between the employer and his employe in the years past paved the way for the labor union. Is it not worth while, by endeavoring to establish confidence, co-operation and understanding between employer and employe, to arrive at those better relations which will make the labor union unnecessary and undesirable?

The answer to the question "In whose hands shall industrial control rest, the plant executive or the labor leader?" lies with the employer himself. Which shall it be? Are you going to answer the question, or allow the labor leader to answer it for you?

The author, A. B. Weeks, is general manager, Canadian Northwest Steel Co., Vancouver, B. C.

Leslie E. Freeman, according to announcement by the American Chamber of Commerce of Brazil, 37 Liberty street, New York, has arrived in this country to open trade relations be-

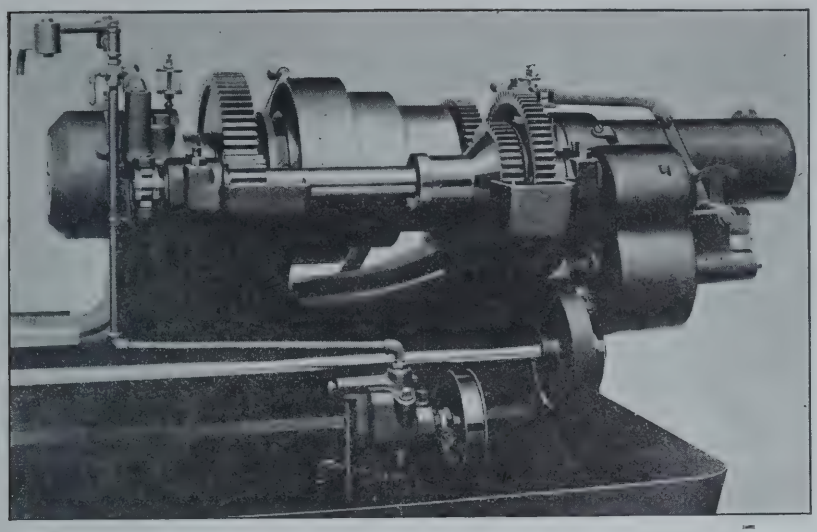

FIG. 1—REAR VIEW OF THE HEAD WITH GUARDS REMOVED SHOWING BACK GEARS

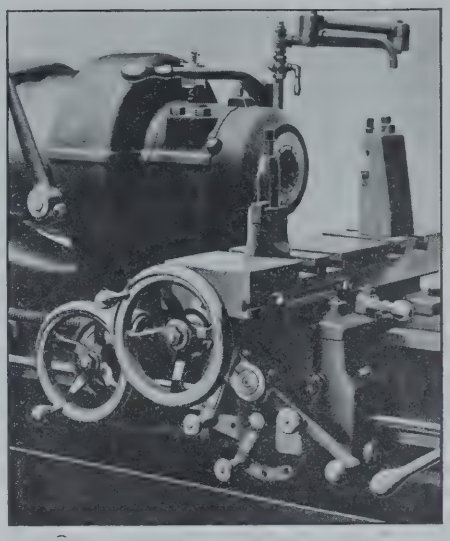

FIG. 2—HEAVY DUTY CARRIAGE

tween the United States and Brazil. Mr. Freeman is equipped with data concerning the markets of Brazil and will supply this information as requested to manufacturers. The chamber is affiliated with the Rio de Janeiro chamber and plans are being made for the publication of a Brazilian-American trade review which is to be printed in this country every month. Brazil offers an excellent market for American products.

Equips Turret Lathe With Double Friction Gears to Insure More Power

THAT machine tool builders recognize the necessity of designing tools of greater production capacity to meet present-day conditions is evidenced by the turret lathe shown in the accompanying illustrations. This tool, which is a recent development of the Warner & Swasey Co., Cleveland, is designed to meet the demand for a machine of great power and strength for finishing gear blanks, forgings and tough, alloy steel parts of various kinds.

The bed and headstock are box section, cast integral, while the turret saddle and carriage travel on flat ways. Both units are equipped with gibs for compensating for wear.

The machine is equipped with double-friction back gears which transmit ample power for heavy forming and facing cuts on bar and chucking jobs and provide a wide speed range. Nine speeds are available, three for each step on the driving cone.

The machines are equipped with either a standard or heavy duty carriage. The heavy duty carriage is equipped with a power cross feed and manually operated longitudinal feeds. The cross feed also can be operated by hand as occasion requires. Six power cross feeds and traverse are obtainable in the apron. The gears in the apron run in oil.

The cross slide is equipped with a setting dial and adjustable stops also are provided to work while the slide is traversing in either direction. The front tool post is round and has an adjustable wedge arranged to be swiveled at any angle. A cutting-off

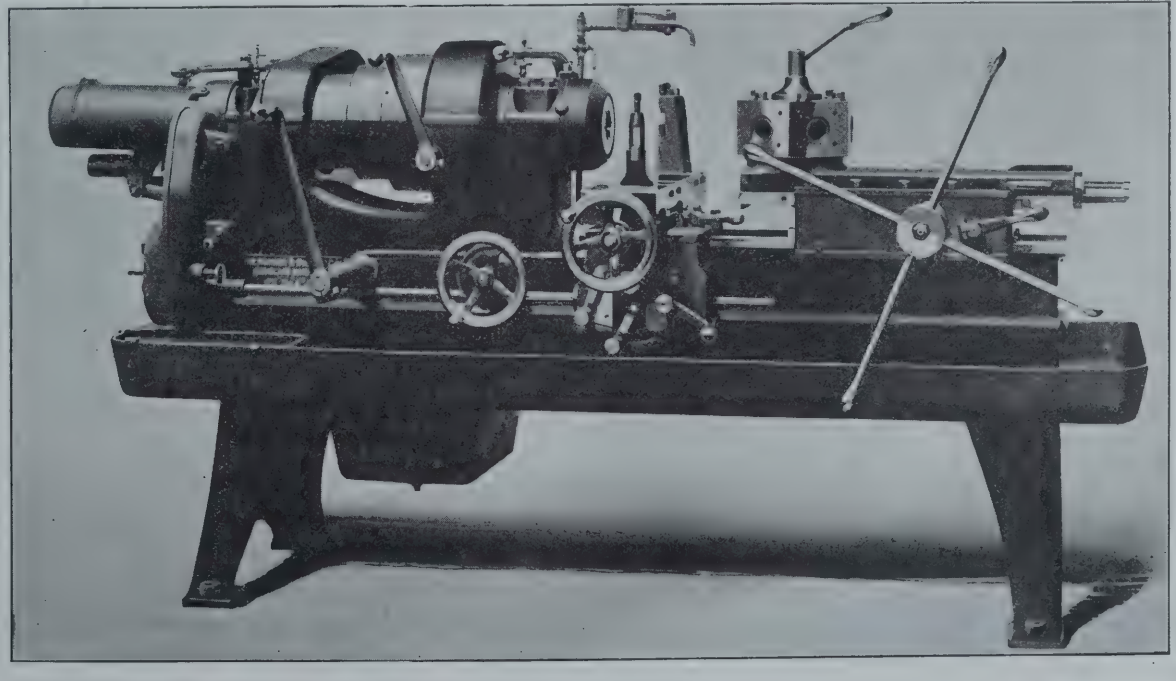

FIG. 3—HEAVY-DUTY, DOUBLE-FRICTION, BACK GEARED TURRET LATHE FOR MAXIMUM PRODUCTION

tool holder is located at the back side of the slide. Either of these tool holders may be removed to permit special forming tool holders to be substituted.

The standard type of carriage is of the design that has been furnished by the company for a number of years. Hand longitudinal and cross feeds are embodied in this carriage. Adjustable stops are provided for the cross slide on this type of carriage while the

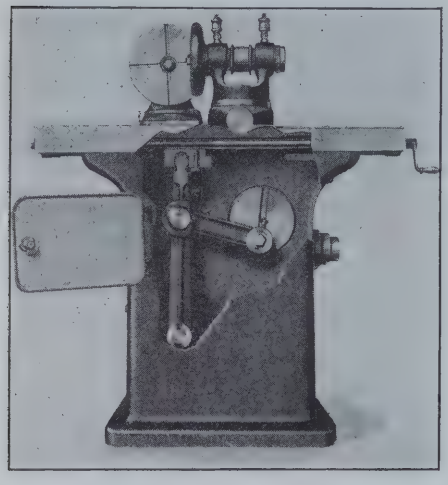

FIG. 1—AN ADJUSTABLE CRANK DISK ACTUATES THE PLATEN

tool posts are the same design as used on the heavy duty carriage.

The automatic chuck and bar feed are operated by a long lever in front of the headstock. A stepped wedge automatically adjusts the collet for slightly varying diameters of stock. A master collet and bushing pads are regularly furnished for holding 2¼-inch round stock unless otherwise specified. Bushings for hexagonal stock can also be accommodated by this collet. Square stock requires a square stock master collet and bushing pads. Extra capacity collets can be used for holding short lengths of stock, larger in diameter than the hole in the spindle.

The hexagon turret is arranged for holding tools with or without shanks. The six tool holes are counterbored for centering plate tools and are fitted with draw bolts.

The turret is revolved automatically by the backward movement of the slide. The locking bolt is at the front end of the slide and works into steel tapered bushings inserted in the bottom of the turret, close to the outside, directly under the cutting tool. Independent adjustable stops operate automatically for each position of the turret. They are disengaged by power feeds. They are readily adjusted for the length of each cut.

The turret saddle has a supplementary taper base to adjust the tool holes in the turret to insure correct alignment with the spindle. Taper gibs, fitted the entire length of the saddle on each side, provide a ready means for adjusting the slide sidewise. Any one of four feed changes, 38, 64, 107 and 190, is instantly obtained by moving a lever. The automatic trip operates in connection with independent adjustable stops for each hole in the turret.

An oil pump of the rotary type, which operates when the machine is running in either direction, is provided.

New Face Grinding Unit is Self Contained

A compact, self contained face grinding machine designed to expedite production on routine work recently was developed by the Cleveland Machine Tool Co., Cleveland. The base is a one-piece box section casting, provided with a door at the front for inspection and oiling of the working parts, and a door at the side for access to a part of the column that can be utilized for tool storage.

The platen is 42 inches long and 9¾ inches wide and travels on one V and one flat way. Due to the fact that the platen is longer than the ways, these are always covered which reduces the wear caused by lodgement of particles of abrasive material. The platen, which is equipped with a crank handle for adjusting the relative position of the stroke, is fed back and forth by means of a crank disk driven by a worm and worm gear. The throw of oscillation can be quickly adjusted from no motion to a stroke of 6 inches. Thus, work 12 inches in diameter can be handled by the machine. Six changes of feed are obtained by a 3-step cone pulley and a 2-speed countershaft. Provision for carrying away cutting fluid from the platen is made in cases where it is desirable to employ wet grinding.

The head carrying the grinding wheel is fitted to a saddle, which is located on the main part of the base through the medium of a dove-tail slide. Gibs are provided to take up wear. The saddle adjusting screw is equipped with a micrometer dial for making close settings while taking finishing cuts. The grinding wheel head rotates on a king pin and can be swiveled to any desired angle.

The grinding wheel spindle is hardened and ground and runs in phosphor bronze boxes, adjustable for wear. The driving pulley is located between the bearings and the grinding wheel flanges are of ample size to insure gripping the wheel properly. A wheel guard is provided.

The work head is secured to the back of the column through the medium of a dovetail slide. It rests on its own saddle which has a longitudinal adjustment of 6 inches. The saddle is secured to the column by a hand clamping screw to permit quick adjustment.

The work driving spindle is hardened and ground and runs in phosphor bronze bearings which are adjustable for wear. The spindle nose is threaded to accommodate a 10-inch faceplate which has two ⅞-inch T-slots located at right angles. Two draw bolts and two collets, ½ and 1-inch, form part of the regular equipment. The machine is clearly shown in the accompanying illustrations.

Warns of Danger Lurking Around Oil Room

Gasoline throws off an explosive vapor even at extremely low temperatures, according to an article prepared by S. D. Rickard, consulting engineer of the Wayne Oil Tank & Pump Co., Ft. Wayne, Ind. Five gallons of gasoline will generate 8000 cubic feet of gas, which, when ignited, expands to 4000 times this space. It is stated that the explosive force of one gallon of gasoline properly mixed with air and compressed, is

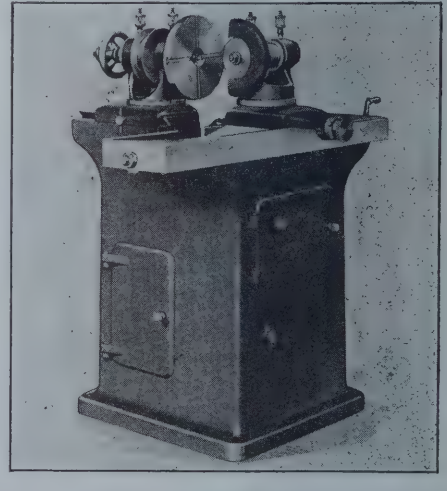

FIG. 2—WHEEL AND WORK HEADS HAVE READY ADJUSTMENTS

equal to 83 2/3 pounds of dynamite. The vapor from gasoline is heavier than air and it settles on the floor much as a stream of water, except that it is invisible. This vapor will remain in a depression for days and even weeks, unless disturbed by a circulation of air. The records show that under certain atmospheric condi-

tions spontaneous combustion will occur in this vapor.

Kerosene, the article states, is not as dangerous as gasoline, yet at a temperature of 70 degrees or over, it throws off an explosive vapor. At a higher temperature, in order to properly ventilate a room in which there is an open tank of kerosene, a circulation of air equal to 200 cubic feet per minute for each gallon exposed should be kept up. These figures vary with the volatility of the oil and the temperature of the air and oil. All petroleum products, including lubricating oils, produce an explosive vapor. The danger from lubricating oils is chiefly from spontaneous combustion.

The gravest danger which confronts the consumer of oils, aside from the gasoline danger, is from paint oils, such as linseed oil and turpentine. A piece of cotton waste saturated lightly with equal parts of linseed oil and turpentine, will if left in a closed room, such as an oil house or storeroom burn from spontaneous combustion within three hours.

Builds Large Oil Engine

A fuel oil engine made by the Nordberg Mfg. Co., Milwaukee, a 5-cylinder 2-cycle engine developing 1250 horsepower, is claimed to be the largest oil engine in America. The main cylinders are 30¾ inches in diameter and have a 26-inch stroke.

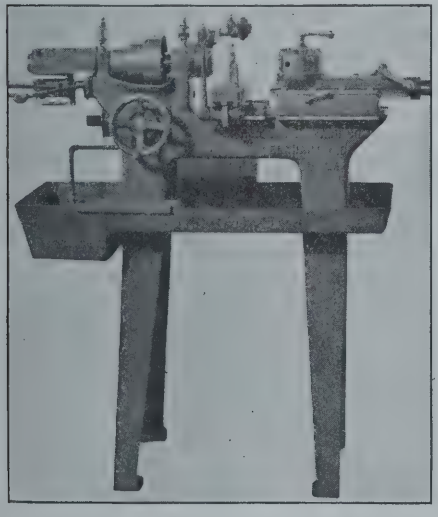

FIG. 1—SMALL SCREW MACHINE WITH LEVER FEED CUT-OFF

Total weight of the engine is about 400,000 pounds.

A scavenging pump driven from one end of the crankshaft furnishes air for cleaning the cylinders of burnt gases. A high-pressure air compressor is bolted to the side of the scavenging pump and driven from the crosshead through beams and links. Each cylinder has four scavenging valves to give good distribution of the air from the air space in the cylinder head to the working cylinder. The fuel oil is injected through a needle valve designed to thoroughly atomize fuel up to 14 degrees Be.

Three of the cylinders are equipped with starting valves cam operated and so arranged that as the air starting valves are thrown out of action, the fuel valves are thrown into action. The fuel is pumped to the atomizer valves by five separate fuel pumps, one for each cylinder. They are required to pump against a pressure of 1500 pounds.

The regular 36-hour shop test, which was run recently, showed that the fuel consumption of the engine at full speed was about 0.42 pound of oil per brake horsepower per hour. The lubricating oil consumption for the 36 hours was about 5½ gallons, which included the oil for every part of the engine. The engine was required to start and reach full speed in six seconds and be ready to take full load immediately.

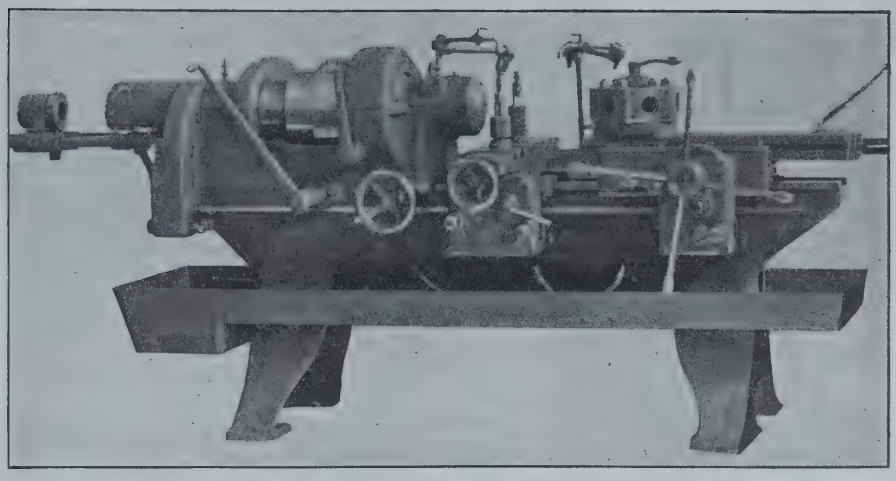

FIG. 2—LARGE SCREW MACHINE ON WHICH UNITS ARE INTERCHANGEABLE

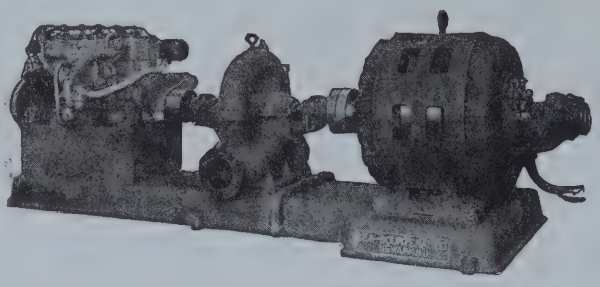
Units of Screw Machines Are Interchangeable

A new line of handscrew machines, embracing 5 sizes ranging from $\frac{7}{16}$-inch to $2\frac{5}{8}$ inches, was recently designed by the Foster Machine Co. Elkhart, Ind. The unit principle of design has been carried out in the machines, many of the parts being interchangeable and independent. In accordance with this idea three different styles of cut-off units have been designed: One with lever feed, one with end screw feed, and the other with power feed. The power feed to the turret also is a separate unit and therefore, a machine may be built with either power feed or with hand feed to the turret slide. The automatic chuck and bar feed also are built as independent units.



The two largest machines are equipped with friction clutches mounted on the spindles between the cone pulley and the friction gear thus serves to engage the spindle in the driving connection direct with the cone pulley on one side or with the bank gears through a large diameter spindle gear on the other side. The frictions are of the cone type and are operated by a hand lever.

The vertical lock bolt of the index mechanism is mounted underneath the front side of the turret almost directly beneath the working tool. The end of the lock bolt lever, which intermittently engages the tumbler for withdrawing the lock bolt preliminary to the indexing of the turret is equipped with a roll for the sake of sensitiveness and reduction of wear.

The cross feed apron is similar in design to the saddle apron with the difference, however, that different sliding gears are introduced in the train to obtain the reverse of the feed movement. The feed friction which works in conjunction with the two large intermediating gears, is operated by rapid acting cam manipulated by a hand lever.

For applying the proper amount of cutting compound to the cutting tools, the larger machines are supplied with a double system of piping, one working in conjunction with the turret slide and the other with the cut-off. On the smaller machines where a smaller amount of the compound is required, a single system of piping is used. The accompanying illustrations show the largest and smallest of the five machines.

The Westinghouse Electric & Mfg. Co. has just announced the award of four annual war memorial scholarships

FIRE PUMP WITH DOUBLE DRIVE

The pump has a capacity of 1500 gallons per minute and is driven by a 150-horsepower alternating current motor and a 140-horsepower gasoline engine.

of $500 each established as a memorial to those employes of the company and its subsidiaries who went to the service of the country during the war. The successful candidates for the scholarships are Herbert S. Pahren, Cincinnati, and Arthur Marthens, Paul O. Laugguth and Andrew P. Lesniak, East Pittsburgh, Pa.

New Fire Pump has Motor and Engine Drive

A pump equipped with double drive, each unit of which depends on a separate source of power, is shown in the accompanying illustration. Double drive for a fire pump is always desirable and in some states is required by underwriters' regulations. The usual form of drive consists of a steam engine and electric motor, or where two separate sources of current are available, two motors are used.

The pump illustrated has a capacity of 1500 gallons per minute and is manufactured by the Lea-Courtney Co., Newark, N. J. The pump is coupled at the left to a 140-horsepower gasoline engine and at the right to a 150-horsepower alternating current motor made by the Westinghouse Electric & Mfg. Co., Pittsburgh.

Builds New Screw Cutting Bench Lathe

The tool shown in the accompanying illustration is a direct motor-driven bench lathe, recently developed by the Urban Machine & Tool Co., Cleveland. The head stock encloses all moving parts, including the driving motor. The gears are alloy steel, heat treated, and run submerged in oil. The spindle is carbon steel, finished by grinding to insure accuracy. End thrust is supported by radial thrust bearings.

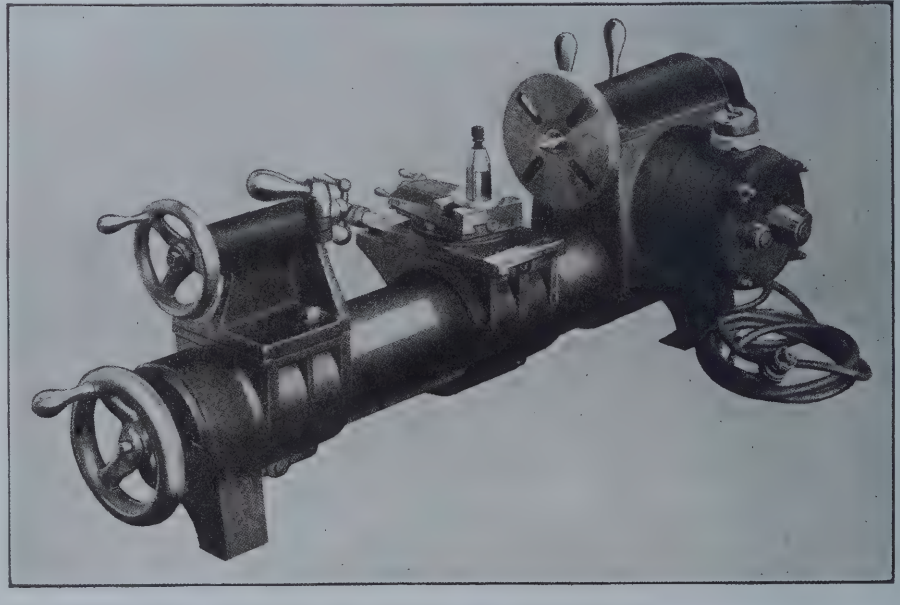
The bed, which is cylindrical, is finished by grinding and is equipped with a hardened and ground takeup gib. The tail stock is of heavy design and fits over the bed, a feature, which it is claimed permits of rigid clamping. The tails tock may be set over for taper turning.

The carriage, which also travels over the cylindrical bed and is ground internally has a wearing surface. This tends to reduce chattering. The compound rest is equipped with taper gibs and graduations are provided for readily setting it at any angle. The longitudinal motion of the carriage is easily controlled and can be stopped instantly by throwing out the clutch lever on the head stock.

The lead screw with a ¾ x 10 acme thread is inside of the bed and therefore is protected from chips and dirt. The change gears permit the cutting of standard threads from 8 to 64, including 11½. The lathe weighs approximately 200 pounds and is a self-contained unit.

The Bethlehem Steel Co. has placed two blast furnaces in operation last week; one stack at Lebanon is making foundry, the other at Sparrows Point, is making basic. The Topton furnace, of the Empire Steel & Iron Co. has gone in on foundry iron. The Temple, Pa., stack may resume soon on foundry iron.

Schwab States Steel Is Industry's King



That normal conditions will not prevail until the country has gone through a greater crisis than that brought about by present labor conditions, is the opinion of Charles M. Schwab, chairman of the Bethlehem Steel Corp., according to an interview given by him at Pittsburgh, where he attended the Carnegie memorial services at the Carnegie institute.

"Steel is industry's king at present," Mr. Schwab is quoted as saying. "Cotton had its day. Wheat had its day. It's steel now. Steel is greater than any other single thing. This year there will be a production of 40,000,000 tons, which will produce a greater revenue than the corn crop."

Several subjects, including labor unrest, the peace treaty, international trade, etc., all vital questions of the hour were discussed by Mr. Schwab. At the memorail services he paid a tribute to the life and character of Andrew Carnegie.

Takes Over Shop

The Jones Structural Steel Co., Ravenna, O., has been incorporated to take over the business of the former partnership of Jones Bros., and improvements will be made at the plant which is equipped for fabricating structural steel. J. A. Jones, formerly of the Alliance Structural Steel Co., is president, and G. G. Jones, formerly of the Penn Bridge Co., Beaver Falls, Pa., is vice president. B. F. Jones is secretary.

SELF-CONTAINED BENCH LATHE WITH CYLINDRICAL BED

Industry Backs Coal Proposal

Manufacturers Urge Government to Stand Firm in Attitude Toward Unreasonable Demands of Miners Notwithstanding Probability of a Curtailment of Operations —Railroad Administration May be Obliged to Curtail Priority List

WASHINGTON, Dec. 2.—With the production of coal at a low ebb, one month after the strike was begun, the government is standing firmly behind its rejected proposal for a 14 per cent increase in wages, made through Fuel Administrator Harry A. Garfield last Wednesday night. That it intends to remain steadfast has been made plain in emphatic terms by Dr. Garfield. He is supported not alone by the government, which is prepared to exert all its powers to break the strike, but also by the great consuming public, including many manufacturing interests. Telegrams and letters coming to the fuel administration from these interests say that, rather than pay any more for their coal, or to have the government yield to the miners, they prefer to close down. That widespread closing down of industries, especially in the Middle West, is imminent unless quick relief in the way of supplies is afforded, is evident from messages also received by the administration, both from government sources and from private manufacturers. Despite this the latter have approved the government's position and are ready to see that it is vindicated at whatever sacrifice and suffering may be necessary. To do otherwise, it is recognized, is to concede the utter failure of organized government and the domination of a relatively few radical labor leaders. Such a condition, it is pointed out, inevitably would lead to chaos sooner or later.

While miners have not returned to work freely, some have drifted back, receiving the 14 per cent increase in wages, which operators through notices posted at the mines, said they would pay in accordance with their acceptance of the government proposal. It is confidently believed that there will be a progressive increase in the number of workers who return inasmuch as they have been officially advised through both Fuel Administrator Garfield and Assistant Attorney General C. B. Ames that they will be protected. To do this troops will be sent wherever and whenever needed by the war department. The department of justice is also prepared to take any legal action that is necessary and will obtain injunctions or take other courses to prevent strikers and union officials from interfering with production. Moreover, where operators may show any inclination not to open their mines, they will be seized by the government, Mr. Garfield has stated, but it is not believed this plan will have to be resorted to, unless it be in isolated cases. A number of mines are closed at present, but not through the action of operators, but because of the failure of miners to return to work. The operators plainly are not satisfied with the proposal of the government, inasmuch as they are to afford the entire 14 per cent increase in wages, but nevertheless they have accepted the suggestion and, with perhaps few exceptions, are cooperating fully with the government. Labor leaders, including Acting President John L. Lewis, whose scornful rejection of the government plan was made immediately after Dr. Garfield read it, continue to defy the government, but whether or not any action will be taken against them under present conditions remains to be seen.

Work on Best Distribution

With the alarming shortage of coal, and the comparatively small production existing, government officials are devising means to work out a solution that at least will afford a minimum of the requirements to prevent an industrial calamity and widespread suffering by the people. It is considered probable that the railroad administration, unless quick further improvement is made in mine operations, will resort to curtailment of the priority list, and cut off supplies entirely from so-called nonessential industries, although actually there are no such industries. Obviously this would cause idleness of many workers and it is said that the iron and steel industry may be one of the heavy sufferers through this reported plan.

While these suggestions looking to conservation of coal may be adopted, and workers may return in increasing number, appreciable relief is not expected without considerable suffering. Acting President Lewis and other officials of the United Mine Workers apparently are determined to do nothing to have strikers resume work. However, hope is seen in the fact that the government, through the injunction granted by Judge Anderson, has tied up the benefit funds of the miners, and after they have missed a pay day or so, it is thought many of them will be ready to return to work. It is held to be certain that they will not be able to obtain credit for living necessities long in the absence of being at work, and should any attempt be made from an organized source to give benefits to the miners this would be construed as part of the conspiracy charged by the department of justice and be punished accordingly.

The miners, after bombastic claims that a 40 per cent increase in wages was the "irreducible minimum," stood ready to accept the suggestion of Secretary of Labor William B. Wilson, who holds cards of membership in the miners' union, that they be granted an increase of 31.6 per cent. When Dr. Garfield and members of the cabinet refused to accede to this proposal, Lewis and other union officials protested that the government had repudiated its word. This, of course, was not so. Secretary Wilson, who has been bitterly criticised for the favoritism he has shown to the miners, merely was a mediator and conciliator, as Dr. Garfield stated before the meeting of operators and miners when he announced the proposed 14 per cent increase. Dr. Garfield said that, according to his figures, gathered from the bureau of statistics, department of labor, the federal trade commission and the railroad administration, it would take an average increase of 14 per cent to bring the scale of the miners up to the highest figured increased cost of living and no one has yet been able to dispute his figures.

Lewis returned to Indianapolis last Friday night after conferences on that day with Secretary Wilson and President Samuel Gompers of the American Federation of Labor, and said that he had arranged with Gompers to have the federation's lawyers assist counsel for the miners in their appeal from the ruling of Judge Anderson demanding cancellation of the strike order. Gompers issued a statement purporting to describe the interview with Lewis and said the award of 14 per cent increase had been discussed, Lewis declaring it would not be accepted. After conferring with Secretary Wilson, Lewis said: "Dr. Garfield represents the government Mr. Wilson told me that." Previously Lewis and other union leaders pretended to believe that Mr. Wilson represented the government.

A meeting is to be held here Wednesday by the operators' wage scale committee to determine details to preserve the existing differentials in putting the 14 per cent wage advance into effect.

In view of the defiant attitude of

the miners, doubt is expressed that they will approve the recommendation of Dr. Garfield that the government create a permanent consultative body, with purely advisory powers, consisting of the secretary of the interior as chairman and of an equal number of representatives of the operators and mine workers. Provision would be made for collecting definite and trustworthy data concerning the coal and coke industry as to production, cost, distribution, cost of living in different districts, selling prices and export requirements. While the miners could not conceivably oppose the plan on logical grounds, their attitude indicates that they would not accept it at this time simply because it was proposed by Dr. Garfield, if for no other reason. Nevertheless congress may act upon the suggestion.

Government Issues Huge Machinery List

WASHINGTON, Dec. 2.—The machine tool section, office of the director of sales, war department, has prepared and is distributing comprehensive bulletins listing approximately 2500 machine tools, valued at about $4,000,000, which are being offered for sale. The tools are listed according to their class, type, size and maker, together with the address of the district offices having the tools for sale where copies of the bulletins are obtainable. A brief description of each tool is given, including its "service condition." The bulletins will be revised from time to time, and issued every 15 days, as sales are made or as additional machines are declared surplus.

The tools listed consist of boring, broaching, centering, cutting off and drilling machines, furnaces, gear cutting machines, grinders, hammers, milling machines, pipe machines, planers, presses, riveters, screw machines, shapers, sheet metal machines, slotters, small tools, lathes, nailing machines, routing machines, trimmers, shop equipment, single purpose and special machines and miscellaneous machines.

The information carried in the bulletins, it is announced, has been obtained from the best sources available. The government invites inspection before purchase and assumes no responsibility as to condition or completeness of machines. The service condition is an approximate rating subject to change from further detailed information or inspection. All prices are subject to change without notice, f.o.b. cars, point of location and all machines and equipment are listed subject to prior sale. Prospective buyers are requested to communicate with their nearest bureau and district office.

Tools for Schools Omitted

None of the tools listed include those which are to be disposed of by the government to educational institutions, as provided in recently enacted legislation. The equipment to be sold to the schools, upon a basis of 15 per cent of their original cost, soon will be inventoried and a list prepared with an announcement as to their location and plans for their disposal.

Copies of bulletins issued and to be issued may be secured from the following various district offices:

AIR SERVICE—MATERIALS DISPOSAL BRANCH

811 Little building, Boston.
2050 Elmwood avenue, Buffalo.
230 East Ohio St., Chicago.
Care Maxwell Motor Co., East First street and Baltimore & Ohio railroad, Dayton, O.
Care aviation general supply depot, Springwells, Detroit.

8-10 Bridge street, New York City.

Navy Tells of Its Price-Fixing Methods

WASHINGTON, Dec. 2.—How the navy department is able to carry minimum stocks of materials at the various navy yards is explained by Rear Admiral Samuel McGowan, paymaster general of the navy and chief of the bureau of supplies and accounts, in his annual report to Secretary Daniels. His report also summarizes the situation as to the sale and disposition of surplus material, that of canceled contracts and the use by the navy of its commandeering powers after the signing of the armistice.

Navy yards were well stocked with materials when the war demands disappeared with the signing of the armistice, Admiral McGowan said. In order that these might be used and further purchases be kept at a minimum, a system was adopted by which reports of all inactive and excess stocks are forwarded to the bureau of supplies and accounts. Requirements submitted are checked against these stores and dispositions made where specifications permit. This clearing house method has, according to the bureau chief, resulted in the interbureau exchange of $7,312,296 worth of material from the signing of the armistice to June 30, last. In addition, cancellation of contracts for materials worth $3,845,279 was ordered as a result of this system.

Due to standardization of material to a large extent many items are being eliminated in yard stocks, resulting in considerable reductions in the money tied up in material, the admiral reported. In order, however, that stocks will not be too scanty or too great under this plan, minimum and maximum quantities are being established at the navy yards covering the different items of material carried in the naval supply account. While not noted in the admiral's report it may be said this system has won the admiration of officials in other government departments and, as stated in the report, the navy is in constant touch with other departments, particularly the Emergency Fleet corporation, with a view to their utilizing navy stocks and vice versa.

Since the signing of the armistice sales of navy surplus materials have aggregated $20,500,000. The report says:

"Paralleling the customary navy procedure in the purchase of supplies, every effort is made in connection with sales to obtain the widest possible competition by advertising." The recovery here, however, is second only to that achieved in the canceling of contracts. This method saved the government $23,800,000, the admiral reported. On these cancellations the navy paid $3,200,000 "to cover raw and partly finished material and special tools taken over by the government overhead expenses, decline in market price or difference between cost and salvage value of material retained by contractors, machinery and buildings taken over or amortized by the government and profit allowed on work in process."

"In making the settlements for damages for the cancellation or partial cancellation of contracts," the report said, "the navy has allowed the actual cost to the contractor on the canceled portion, plus a fair profit on any work done on that portion, but no profit was allowed on the unperformed portion of the contract."

There has been considerable criticism of the navy for its continued use of war powers, particularly those of commandeering, in the months following the cessation of hostilities. In discussing this Admiral McGowan said:

"Although the navy commandeering powers were in nowise curtailed by the cessation of hostilities, it was thought that the navy should lend its influence toward the resumption of normal business conditions, and accordingly navy orders have since been issued as a last resort and only when it appeared that real competition is lacking and that unfair prices are being demanded.

"Prompt steps were taken to effect final settlement of all outstanding navy orders before the detachment of the commodity specialists who were conversant with the details of each transaction. Final prices were fixed only after exhaustive investigation of the costs and other conditions. Out of 6200 navy orders issued 339 now await final price fixing and in most of these cases delay is due to causes beyond the control of the navy. It is estimated that not more than 10 cases of price fixing by the navy will require final adjudication in the court of claims."

Why Brokers Were Barred

Concerning the elimination of brokers the report said:

"During the period of the war, the activities of brokers, commission men and contingent fee agents were curtailed to a minimum due to government regulation of industries and other causes. The navy was especially free from their importunities, owing to the fact that firms of this nature had not been placed on the mailing lists for many years past and there remained only a small number of them on the navy lists at the outbreak of the war.

"Of the latter, many were debarred during the period of the war for default in delivery and other causes, including attempted fraud. Following the armistice, however, the few remaning brokers on the mailing lists immediately submitted bids in large numbers and covering all kinds of supplies. At one opening a considerable percentage of the bids was from these concerns.

"It was obvious that the acceptance of such bids would result in an intolerable condition wherein a few firms of this sort, owing to their being the only brokers on our lists, would be in the position of having a preference over other firms of the same character. Further, such a condition would tend to destroy the confidence and prestige which the navy had earned among reliable and legitimate contracting concerns in all lines of industry.

"The navy, therefore, refused to accept any further bids from such agencies and eliminated all of them from the bidding lists, thereby complying implicitly with the plainly mandatory requirements of section 3722 of the revised statutes that 'No person shall be received as a contractor who is not a manufacturer of, or regular dealer in, the articles which he offers to supply.' Following this action, persistent efforts were made by these brokers, agents, etc., to be restored to their former status as bidders, their principal argument being based on the interpretation under the statute of the term 'regular dealer'."

Country's Industry Great War Factors

WASHINGTON, Dec. 3.—The smoke of American factories, reaching from the Atlantic to the Pacific, contributed as much to the defeat of the Germans as force of our blows on the Marne and Meuse.

This point is made by Maj. Gen. William J. Snow, chief of field artillery, in his annual report made public today. The co-ordination of the output of guns and material, with the development of artillery units fell on the office of the chief of field artillery. At first, it is pointed out, to further the ends of training, this consisted of a redistribution of the scant material on hand; later it developed into not only supplying all our combatant troops in France and America with the necessary equipment and reserve, but in following up closely all improvements and inventions in ordnance and equipment.

During the early part of 1918, General Snow states, the material output dragged woefully behind the training of the personnel, but as the year drew to a close these two great factors for the successful conclusion of the war drew abreast, forcing Germany, as much as any one thing, to sue for an early peace.

The report, like those from other branches of the war department, however, takes occasion to sound warning against the United States ever again being caught utterly unprepared in material for war, and it reviews the condition at the entrance of this country into the war in its negligible supplies, the pathetic makeshifts, such as wooden guns, used to train soldiers, and the lack of accomplishments even up to the time of the armistice.

In the list of recommendations made, General Snow says:

"It is indispensable that an adequate reserve of material and equipment, particularly of ordnance, for our needs upon the outbreak of war be accumulated and maintained in time of peace. Had we not been able to obtain ordnance from the French and the British we would have been a negligible factor in the war until the end of 1918. When the armistice went into effect, 19 months after we entered the struggle, with the exception of 24 eight-inch howitzers made from British plans by the Midvale Steel & Ordnance Co., we had in line not one single piece of divisional, corps, or army artillery manufactured in America after our entry into the war."

The report also recommends that the development of the motorization of artillery of all calibers, including that of caterpillar mounts, be pushed energetically.

The question of material is declared to have been a most serious one and its lack has had a highly injurious effect upon the efficiency of the divisional artillery. The French government was to completely equip the American divisional artillery until such time as American material could be manufactured and shipped. This material consisted of artillery, 75-millimeter guns, 155-millimeter howitzers, vehicles and fire-control equipment. Although the first brigade was promptly and completely equipped, various causes made it difficult to provide the necessary equipment, especially as regards the 155-millimeter howitzers and limbers, fire-control equipment and horses. In many of the 155-millimeter howitzer regiments not even guns were available in sufficient numbers for purposes of instruction. During nearly the entire training period of the regiments after Aug. 1, 1918, there were available but four howitzers for the use of the entire regiment.

"One of the great lessons that our people should learn from this war is that it requires much time to

manufacture guns," it is stated. "* * * Had it not been for the material furnished us by the French and the British, it is believed that the war would have been lost."

General Snow says that while the facts as to shortage are as stated, he does not wish to leave the impression that the ordnance department was negligent in providing. It takes months to make a gun and carriage, it is explained, and the facilities for accomplishing this on a quantity-production scale, such as was needed in this war, did not exist in this country.

"Plants for this purpose had to be created from the ground up—the buildings had to be erected, the machinery for installation had to be manufactured, the skilled personnel had to be gathered together, the factory organization created, etc.," General Snow says. "It is a monument to American genius that we did as well as we did. Nevertheless the fact still remains that there was this tremendous shortage, and it rendered doubly hard the task of training the field artillery."

The field artillery, it is declared, suffered far greater than any other arm of the service the lack of equipment absolutely essential in the training of its units. On March 31, 1917, one week before the declaration of war, material for the training of field artillery units in the United States consisted of only 930 pieces, ranging from 2.95-inch mountain guns and howitzers to 6-inch howitzers. On April 1, 1919, production had reached the following figures: 1281 75-millimeter guns, 33 3-inch guns, 395 4.7-inch guns, 334 155-millimeter guns, 521 155-millimeter howitzers, 213 8-inch howitzers and one 9.2-inch howitzer.

Speaking of the lack of material for training purposes, General Snow says at one point:

"Entire brigades were furnished with from one to four guns for the training of the entire unit, with other necessary material distributed in like proportion. Wooden guns were improvised as were radio and telephone sets. Ingenuity was displayed in the construction of sights, scales, trench mortars, and fire-control equipment, but these improvizations in no way made up for the deficiencies in material which threatened at all times to limit the efficiency of these units."

General Snow adds that "the efficiency of the new units may be attributed to the guiding hand of the few regular officers, to the magnificent spirit and earnestness of the newly-commissioned officers from civil life, and to the interest, 'pep', intelligence, and business-like seriousness of the drafted men."

English Steel Industry Becomes More Active

Washington, Dec. 2.—The first two weeks of November showed a tremendous increase in new orders in English iron and steel industry, particularly for foreign countries, according to Wilbur J. Page, American trade commissioner at London, in a report to the department of commerce. Many manufacturers, he said, have had to refuse sufficient business to keep their mills running full capacity and as a result of this most merchants are able to dictate terms of settlement for foreign orders. The usual procedure is payment against document, he reported.

"Users of American billets are complaining about the slow delivery owing to shipping difficulties," Mr. Page wrote. "In many cases they are placing orders locally for bars, puddle bars, gas strip, etc. If United States producers could only increase production and assure reasonable delivery orders for billets and bars would be placed in large quantities in spite of the adverse rate of exchange."

One English concern was reported ready to place business here for 20,000 tons if there was any likelihood of getting reasonable delivery. In Staffordshire many of the re-rolling mills were hard pressed for material and as a result several of the mills were idle except for such small lots of stock as they were able to purchase from government supplies held over from the war.

Since the close of the strike in Wales, Welsh mills have been flooded with orders, Mr. Page said, but the largest of these has not yet started its blast furnaces and there was no prospect of making deliveries short of the New Year. Producers of billets have advanced their prices well over £15 5s. One firm in South Wales was offering a small lot of billets at £15 15s which represents an advance of 7s 6d on previous quotations.

"The molders' strike has now lasted so long that its effect is being made manifest on the iron and steel trade," continued Mr. Page. "It is becoming more and more difficult to effect renewals on plants and repairs. New machine equipment, especially rolls, are almost unobtainable."

English merchants and manufacturers recently reported an improvement in inquiries for high speed steel. This, Mr. Page interpreted, is an indication that the stocks accumulated by the British government for war purposes have become somewhat depleted, although there are considerable government stocks still left. Some sizable foreign orders for high speed steel recently were accepted, he said.

The call for tungsten has also shown a decided improvement and carbon crucible steel can only be said to be in fair demand. The shortage of ferrovanadium was reflected in a recent advance price to 30s per pound. Ferrochrome and ferrosilicon were in abundant supply with demands quiet. Ferrosilicon of 45 per cent quality was quoted at £18 per gross ton.

War Liquidation About Four-Fifths Done

Washington, Dec. 2.—To Nov. 2, a total of 27,923 war department contracts valued at $3,868,417,000 had been reported suspended, as compared with 27,752 suspended contracts valued at $3,877,095,000 reported the preceding week. These changes are due to corrected reports.

The present status of contract liquidation is as follows:

	Number	Value
Total suspended	27,923	$3,868,417,000
Total liquidated	22,804	2,106,738,000
Per cent liquidated of total suspended	81.7	54.5

On the 22,804 contracts liquidated, the saving effected was $1,857,095,000. It cost $249,643,000 to secure the relinquishment of these contracts. In addition, partial payments in liquidation on other contracts amounted to $85,838,000, making a total of $335,481,000 paid in liquidation to Nov. 8.

The present status of contract saving is as follows:

Value of contracts liquidated	$2,106,738,000
Saving effected	1,857,095,000
Per cent saving effected	88.2

There are 5119 contracts remaining to be liquidated. Of these, the value of 2211 is known and amounts to $1,761,679,000. Assuming that future liquidation in each bureau can be effected at the same rate of cost as has obtained in the past, the cost of liquidating these contracts may be estimated at $224,496,000.

Lifts Pig Iron Ban

Washington, Dec. 2.—Pig iron has been removed from the British export embargo list, according to a cable under date of Nov. 22 from Consul General Hollis at London, to the bureau of foreign and domestic commerce.

The S. F. Bowser Pump & Tank Co., Ft. Wayne, Ind., has purchased the plant of the Menefee Foundry Co., that city. The Menefee company has made castings for the Bowser company for the past 30 years.

Men of the Iron Trade

Personal News of a Business Character Regarding the Men of Affairs of the Industry

HENRY PENTON, Great Lakes district manager for the Emergency Fleet corporation, resigned Nov. 30, his war work having been completed. Mr. Penton is the only district executive of the 12 appointed in August, 1917, who remained from start to finish, and with his associates he has left a record of great accomplishment. The first vessel requisitioned for the government was delivered from the Cleveland or Great Lakes district, as was also the first vessel built under direct contract with the Emergency Fleet corporation. Great Lakes builders already have delivered one-fourth of the total number of merchant vessels contemplated by the corporation for the entire United States. In the 27 months prior to Nov. 30, the Great Lakes district completed and sent to sea 374 cargo vessels of 1,396,890 tons, total deadweight tonnage, and 30 tugs. On its contracts, 54 cargo ships and 18 tugs remain to be delivered from the Cleveland district, all of which will be ready for the opening of navigation in 1920.

Mr. Penton's eminent success as district executive for the Emergency Fleet corporation, doubtless can be accredited to his many years of training as a naval architect, marine engineer and practical shipbuilder. Before the war he had spent many years in executive positions with various shipyards around the Great Lakes. and was a designer and builder of high standing. His familiarity with shipbuilding problems from an executive standpoint fitted him especially to expedite the government's effort in connection with shipbuilding on the lakes during the war.

For many years he was a member of the firm of Babcock & Penton, New York and Cleveland, marine architects.

In a statement to his staff upon his resignation, Mr. Penton said:

Without your assistance and co-operation the enviable record and unique standing of the Great Lakes district would have been utterly impossible. The elder members of this force have taken part in a performance which stands without a parallel in history. I do not think it is too much to say that without the assistance of the Great Lakes district and the revelation of its resources the outcome of the war might have been very different.

Of the efforts of the builders, Mr. Penton made the following statement:

The builders of the Great Lakes showed the stuff they are made of, by expanding their capacity to meet the national need, even during the stress of war times, almost without governmental assistance. Out of over $225,000,000 advanced by the Emergency Fleet corporation for shipyard construction and expansion, less than $2,225,000 came to the Great Lakes. The builders in this district demonstrated beyond a doubt that but for canal limitations between the lakes and seaboard the shipping center of the United States would be on the Great Lakes. The lake yards outpointed the rest of the country at every stage; speed of construction, riveting output, tonnage per man, number of ships per berth, cost of supervision and other details. One yard, with only three berths, delivered 14 completed 4200-ton ships in the past 11 months. Others were not far behind.

HENRY PENTON

M. P. Emmerich has been made purchasing agent of the Duquesne Steel Foundry Co., Pittsburgh and Coraopolis, Pa., to succeed J. G. Hallas, resigned.

Edward F. Sise recently resigned as president of the Northern Electric Co., Montreal. In 1890 Mr. Sise organized the Wire & Cable Co., of which he was managing director until its amalgamation with the Northern Electric Co., at which time he became president of that company. He is succeeded by Paul F. Sise.

J. H. Nead now is metallurgist for the American Rolling Mill Co., Middletown, O., having served as captain in the ordnance department in this country and in France, during the recent war.

William H. Haywood, formerly associated with the Youngstown Sheet & Tube Co., Youngstown, O., in its sales department, has accepted a position with the Youngstown Boiler & Tank Co., that city.

Herbert Du Puy, who recently retired as chairman of the Crucible Steel Co. of America, following a serious surgical operation at the French hospital, New York, again was operated on there, Nov. 26. Following the operation, it was said that Mr. Du Puy's condition was regarded as encouraging.

William S. Boyd, who has been for a number of years purchasing agent of the Page Steel & Wire Co., Monessen, Pa., has severed his connection with that company to become manager of the steel and iron scrap department of the Thomas D. Prosser Co. Mr. Body's headquarters will be at the main office, Wooster, O.

B. Frank Hiestand has been elected vice president of the Pulaski Iron Co., Real Estate building, Philadelphia, taking the place of W. H. Gibbons, who resigned. Mr. Hiestand has been identified with the Marietta Casting Co., Marietta, Pa., and is connected with a number of enterprises in that city. Harry C. Griefzau has been made secretary and treasurer of the Pulaski Iron Co., succeeding Mr. Gibbons who also held these offices. Mr. Griefzau has been connected with the Pulaski company for 12 years. N. G. Kamerer has been made assistant secretary and treasurer, succeeding Mr. Griefzau. The company's blast furnace, coal mines and coke ovens are located at Pulaski, Va.

Men of the Machinery Trade

Personal News of a Business Character Regarding the Men of Affairs of the Industry

FREDERICK W. SINRAM, who recently was elected president of the Van Dorn & Dutton Co., Cleveland, specialist in gears and gear cutting, has been acting head of the company with the title of vice president since the death of H. H. Hodell, about two years ago. This recognition of his services comes after a period of nine years of service with the company, which began in 1910 when he was made secretary and manager of sales. In 1911 when Mr. Dutton resigned from the company, Mr. Sinram was elected treasurer, retaining the duties of secretary. He also is treasurer of the Van Dorn Electric Tool Co., and since its organization about three years ago, has been president of the American Gear Manufacturers' association. T. B. Van Dorn one time vice president of the Van Dorn & Dutton Co., now becomes chairman of the board and Franklin Schneider, who formerly was factory manager, has been elected vice president. Mr. Schneider also is president of the Van Dorn Electric Tool Co. The present treasurer of the Van Dorn & Dutton Co. is F. G. Hodell.

J. Franklin Fort resigned as chairman of the federal trade commission, Washington, Dec. 1, because of ill health. He formerly was governor of New Jersey.

George F. Fuller, president and treasurer of the Wyman-Gordon Co., Worcester, Mass., and Cleveland, has been elected president of the Worcester Country club.

D. J. Burns, with headquarters at 1340 East Ninety-first street, Cleveland, has been appointed Ohio sales representative of the Miller Saw-Trimmer Co., Pittsburgh.

C. G. Ugguas has been appointed assistant chief engineer of the Cleveland Machine & Mfg. Co., Cleveland. Mr. Ugguas formerly was identified with the Youngstown Sheet & Tube Co., Youngstown, O., in the drafting department.

A. E. Nordwall has been placed in charge of the branch office established at 201 Maynard building, Seattle, by the Black & Decker Mfg. Co., Towson Heights, Baltimore. Mr. Nordwall will have charge of the distribution of the company's products, namely portable electric tools, etc., in the state of Washington, under the direction of the main Pacific coast office, 918 Hearst building, San Francisco.

W. J. Riley recently resigned as buyer of machinery and tools, etc., for the Covert Gear Co., Lockport, N. Y., to become efficiency engineer for the Dittmer Gear & Mfg. Co., that city.

F. W. SINRAM

Oakley S. Walker, head of the O. S. Walker Co., Worcester, Mass., manufacturer of grinding machines and magnetic chucks, retired from business upon the reorganization of the company recently. Mr. Walker is the inventor of the magnetic chuck and of many other machine parts. He organized the O. S. Walker Co.

J. A. Tarkington, superintendent and consulting engineer of the Kissel Motor Car Co., Hartford, Wis., will leave the company on Jan. 1 to become directing head of the Tarkington Motor Car Co., organized at Rockford, Ill., to manufacture passenger automobiles. Mr. Tarkington has been connected with the Kissel company for nearly 14 years.

Frank H. Willard, assistant general manager of the Graton & Knight Mfg. Co., Worcester, Mass., has been elected general manager and vice president of the company. Mr. Willard became affiliated with the Graton & Knight company in 1882. Since then he has held successively the positions of foreman, superintendent and assistant general manager.

Matthew Finn is no longer treasurer of the Federal Tool Co., 453 Michigan avenue, Detroit, manufacturer of precision tools, the duties of that office being combined with those of the secretary, Thomas T. Tierney. At the recent reorganization meeting, Victor Fabry was elected vice president. J. Larkins remains as president.

Francis J. Reilly, formerly with the Brown & Sharpe Mfg. Co., Providence, R. I., and later with the service departments of *Machinery* and *Railway Mechanical Engineer,* New York, has been appointed assistant advertising manager of the Norton Co., Worcester, Mass., to succeed Russell S. Coe, resigned. During the war Mr. Reilly was with the United States aircraft production board.

W. E. Seymour, of Beloit, Wis., has become associated with the A. O. Smith Corp., Milwaukee, as vice president and general manager. Mr. Seymour for six years has been general superintendent of the Eclipse works of Fairbanks, Morse & Co., at Beloit, previously having been with the Ford, Cadillac and Buick automobile factories and later going to the Fairbanks-Morse works at Three Rivers, Mich. He goes to the Milwaukee company to take charge of the enlargement of its works at a cost of more than $3,350,000, the first unit of which, 160 x 740 feet, is now being completed. Contracts for a second unit will be awarded shortly. The Smith company ranks as the largest producer in the world of pressed steel automobile frames and furnishes some of the largest makers of cars and trucks with pressed, forged and stamped parts. Before retiring from the Fairbanks-Morse organization, Mr. Seymour completed plans for a new $1,500,000 gray iron foundry with a capacity of 400 tons a day with eight cupolas. This will be built early next year.

Trade Pouring in on Germany

Iron and Steel Companies Making Remarkable Recovery, Although Profits Are Being Sacrificed—British Makers Demanding Protection Against "Dumping"—Lifting of Import Restrictions Disastrous for Some Concerns

European Headquarters,
THE IRON TRADE REVIEW,
16 Regent Street, S. W. I.,
London, Nov. 20, 1919.

THE German *Frankfurter Zeitung* makes a remarkable boast as to the ability of Germany to dump her materials abroad at prices below her competitors. It says:

"As the present low exchange of the reichmark is operating as an export medium of the heaviest kind, German wares are in a position to force their way in foreign markets with ease, and at prices which will yield the German producers and exporters large profits, while creating for foreign producers the most serious, sometimes even an intolerable competition."

This statement hardly is justified by the facts, and there is some evidence that although the iron and steel companies are showing a remarkable recovery in output, they are feeling severely the financial strain. With regard to German production, the low water mark was reached in February last when the output of pig iron fell to 469,000 tons as compared with 892,788 tons in February, 1918, and 1,494,000 tons in February, 1913. But after February, 1919, the output increased steadily to July, when it reached 576,000 tons. The total output of pig iron in Germany in the first eight months of the year was 4,140,000 tons, as against 7,460,000 tons in the same months of 1918, and 11,220,000 tons in the same months of 1913. For the ten months, Germany's output was 5,160,000 tons.

Nominal prices of iron and steel products and coal in Germany are rapidly rising. On Oct. 1 prices of iron were raised by various amounts, ranging between 112 and 162 marks per ton. The German Stahlwerksverband has just added 250 marks a ton to its price for mine rails, making the present price 1050 marks a ton. On Oct. 7 300 marks per 1000 kilos were added to the cost of heavy rivets, and other rivets have been advanced 300 per cent. Generally, the finishing mills are adding from 300 to 400 per cent to their prices. Leading German manufacturers claim that Germany, taking exchange into account, remains the cheapest country in the world. It appears that prices of German pig iron are about ten times as high as in 1914. At present a ton of German hematite costs 735 marks, but taking exchange into account this represents an actual increase of only about 50 per cent, whereas in Sweden advances are from 100 to 200 per cent above the peace rate.

Apparently Germany is greatly elated over her prospects of international trade. "If Germany could produce steel sufficiently," says the *Handelstidning*, "she would wipe out all competitors." This paper points to the fact that the Solingen steelwares makers, all 25 of whom were represented at the Frankfurt fair, were besieged by English, Scandinavian, French and American buyers, and "could have sold ten times as many knives and scissors as they produce normally in 10 years." It so happens however, that Germany's productivity is limited, and, further prices have not stopped advancing. That is shown by the fact that nearly all the German steel and iron companies report vanishing profits for 1918-19. The Hohenlohe Co. made a profit of 6,000,000 marks last year, but this year lost that amount. Thyssen, of Muelheim, has had to suspend his 10 per cent dividend; the Hoesch Smelting Co., of Dortmund, reports a deficit of 17,000,000 marks; and the Dusseldorf Rhenish Steel Works, the Hasper Iron and Steel Works, and several minor industries report a slump in profits. All complain of high wages, coal prices, diminished output, and higher prices paid for Swedish ore. It follows that if Germany's iron and steel industry is not to suspend home prices must be put up still further, and she will ultimately lose most of her present advantage from the depreciated reichsmark exchange.

British competitors after carefully comparing German and British conditions are not greatly alarmed, although they are not disposed to ignore the possibility that Germany, following her old policy, will send out a lot of stuff at a very cheap rate, with the intention of raising her price afterwards.

"America Come to Stay"

George Carrington, president of the Staffordshire Iron and Steel institute, devoted a portion of his presidential address at the recent meeting to a consideration of the question of foreign competition, and especially that of America. He said the 8-hour system adopted in the Black country industry had not proved satisfactory.

The world's prewar iron and steel capacity was about 60,000,000 tons. It is now 80,000,000 tons, but whereas Germany was formerly second in the world's production with a capacity of about 19,000,000, or about three times the British tonnage, the war has reduced her to an equality with Great Britain and France. America had a prewar capacity of 45,000,000 tons, and with her natural resources, there is no reason why she should not more than double her present output. Present capacities, according to Mr. Carrington, are: America, 45,000,000; England, 11,000,000 to 12,000,000; Germany, 12,000,000 to 13,000,000.

"America and France," he said, "come to stay, and it will need long, continued, and persistent effort to retain the former high position of Great Britain. America's output is once more on the increase, and, in the words of Mr. Layton, the director of the National Federation of Iron and Steel Manufacturers, "by merely selling 10 per cent of her output into the markets of the world she can swamp Great Britain."

With regard to exports the British monthly average in 1913 was 411,000 tons as compared with America's 231,000 tons. Great Britain in June last exported 194,000 tons, while the American figure for March was 408,000 tons. Mr. Carrington pointed out that two countries had changed places.

* * *

Prewar Contracts Defaulted

A number of interesting legal cases have arisen recently in Great Britain as a result of defaults on prewar contracts for raw material carrying low prices. In many cases the defendants reside in other countries and some delicate questions of jurisdiction are involved. One of the most important of these disputes, recently adjudicated before the lord chancellor, is the case of an English company operating a foundry at Leeds and a railway tire and axle plant at Manchester versus A. Johnson & Co., a Swedish concern doing business at Axmaz, near Stockholm, Sweden.

On May 23, 1908, A. Johnson & Co. contracted to furnish the English plaintiff with its requirements of Swedish pig iron from 1908 to 1920 inclusive, delivered at Leeds or Manchester for £4 17s 6d and £4 13s 9d

per ton, respectively (about $24 at then prevailing exchange). This was subsequently increased by agreement to £5 and £4 18s 3d. The defendant defaulted and has failed to present shipping documents or to forward any pig iron since 1916.

The decision was to the effect that since the arrangement was an ordinary c.i.f. contract, in the execution of which the tendering of shipping documents in England was a supplementary and not an independent proceedings, the British courts are without jurisdiction. This decision is of great practical importance to American exporters to Great Britain, since the rule of no jurisdiction has been laid down by the highest legal authority in the empire, and exporters have been constantly seeking to obtain judgments on the ground that the mere submission of shipping documents within British territory makes the sellers responsible to the British courts.

* * *

New Syndicate Formed

A great syndicate has been established in Great Britain with a capital of £5,000,000, the object of which is to secure co-operative production between several kindred industries. At a meeting held in London in October, John Slater, who presided, said the syndicate is composed of producers of coal, and they have modern collieries fully equipped for profitable operation when the government relinquishes control. The representative of the pig iron interests in the syndicate, Mr. Whitwell, said it is now negotiating for certain steel works. It now has shipbuilding yards, but they are suffering from the lack of raw material.

* * *

Appeal for Protection

A letter and memorandum have been sent to the British board of trade by the director of the Federation of British Industries. The main subject relates to the withdrawal without proper notice of restrictions on imports which action, it is claimed, has inflicted serious injury on certain industries. Instances are given of industries carefully nurtured during the war which have received a deadly blow. The government is asked to consider a series of industries which it already has declined to regard as "key industries entitled to special protection. Among these are the plants manufacturing steel balls and ball bearings, and producers of the ferroalloys, molybdenum, chrome and silicon, manufacturers of drop forgings and stampings, rolled steel wire rods, and wire nails. In addition it is pointed out that the bridge and structural iron works, marine engineering shops and iron and steel wire mills are particularly affected by the dumping of foreign goods.

Regarding competition through underpaid labor, the federation hopes that the work of the international labor bureau may lead to a clearer knowledge of the difference in wage costs in various countries. If steps can be taken by the countries in the league of nations to prevent goods produced by underpaid labor from being sold in other countries, much will be done to attain the object at which the league is aiming. This is of prime importance, the federation believes, since Great Britain seems now destined to rank permanently as a high-wage country.

* * *

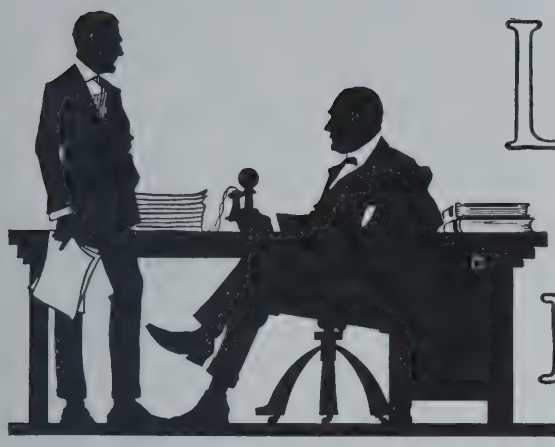
Britain Short of Cars

An official explanation has been given with regard to the serious shortage of British railroad cars. It is pointed out that during the war from 10,000 to 20,000 British cars were sent overseas, and have not yet been returned. From 30,000 to 40,000 private cars are out of use awaiting repairs, and this has caused an unprecedented demand on the railroad companies' cars, especially for conveyance of coal. In addition to this, there is an unusual output of manufactured goods, especially from firms who have changed over from war to peace production.

Several Factors Affect Fuel Shortage

European Headquarters,
THE IRON TRADE REVIEW,
16 Regent Street, S. W. I.,
London, Nov. 20, 1919.

FROM the famous French coal mines of the Pas de Calais region, which were for four years in the zone of fire, water is now being pumped out at the rate of 1,000,000 cubic meters per 24 hours. Forty-five large pumping plants are in operation. This coal field is within the zone of operations of the British army and the British authorities still are giving all the assistance they can in the work of rehabilitating the mines. However, at least 20 shafts are still blocked and considerable time must elapse before coal shipments in any quantity can be expected.



These conditions, coupled with the failure of the Germans to deliver the quantities of coal and coke stipulated by the armistice, are aggravating the fuel shortage which has reduced many of northwestern Europe's iron and steel plants to a state of partial paralysis.

But little foundry pig iron is being produced in Lorraine at present owing to coke shortage, which is accentuated by the lack of railroad equipment, including both locomotives and cars. As a result, although 50 cargoes of coal arrived at French ports during the first week in November, largely from the United States, nearly 150,000 tons still are lying on the docks owing to lack of rolling stock. Therefore, unless the curtailment of production resulting from the American miner's strike extends for a long period, this disturbance will have little effect on the European fuel situation.

Labor difficulties are complicating the situation both in France and Belgium. In the coal mines at Briey 18,000 men now are employed, compared with 23,000 during the war. The daily production of this important group of mines is between 8000 and 9000 tons. The importation of Italian labor is being considered, to which the French miners strenuously object.

As cabled to THE IRON TRADE REVIEW today, the iron works at Roubaix and Tourcoing, just behind the old German lines in northern France, are shut down from lack of fuel. Bringing in coal by motor truck has been considered but rejected as being too expensive. What is wanted is a daily train of 400 tons from the Saar or Lorraine. The alternative is for 33 plants to remain closed or to operate in a limited fashion.

Every effort is being made to encourage the shipment of Saar and Lorraine coal to other districts, but Alsace-Lorraine with its consumption of 17,000,000 tons annually must first be supplied from these sources. The German mines now under French control can produce 13,900,000 tons annually, but in October German mines furnished France only 17,000 tons of coal and coke. Coal freight rates from Strassburg and the Saar to Nancy are 8.50 and 8.35 francs per ton respectively (about $1). The rate is satisfactory to the iron and steel interests but the tonnage is lacking.

Little Stories of Business Life

Saving His Job

ILLUSTRATIVE of the contention of steel plant officials that it is the unthinking rather than the thinking toiler who has gone out is the following story told about a couple of men of one of the plants of the American Sheet & Tin Plate Co.

Bill, who did remain at his work was accosted by Joe, who thought he had a grievance and stayed out.

"Bill," said Joe, "I understand you went to work today and that you took my job. Do you think that was a nice way to treat a fellow you've known as long as you have me?"

"We have been friends for a long time, Joe," said Bill, "and it is true that I went to work today, but I haven't taken your job; I'm holding it for you till you come back. I have stayed on the job because I want to help keep the old works going, so that when you and some of the other fellows who have not been using your heads, come to your senses and start looking for a job you'll have one to go to."

Joe reported for work the next day.

How It Works Out

THAT Judge Gary was proceeding along the right line in contending before the senate committee that no shop which recognizes the labor union can continue as an open shop is borne out by experience in a strike of fabricators in Chicago. Two policies had been followed by the shops, one class paying no attention to a man's union membership while the other saw to it that no union men were allowed to remain on the payroll. When the strike came the former class of employers found the number of union men in some cases was larger than they had thought, but regardless of the proportion the strike caused the entire shop to go out, nonunion men remaining away through fear. The only shops remaining active were those which had excluded organized labor. Not the least trouble was experienced by them and operation was not interrupted.

And It Rained Coke

WHEN the steel strike was called, and operations at a good many plants suspended, coke producers found themselves in a serious dilemma. Shipments of large tonnages of coke were held up by reason of the banking or blowing out of furnaces for which the coke was intended. In a good many cases the coke already had been loaded on cars, so that, in order to escape demurrage, the coke operators immediately began rustling up buyers of this coke for spot delivery at cutprices. One of these buyers was an eastern Pennsylvania pig iron maker who, needing the coke, and finding the price attractive, closed for a large block offered to him. He specified that the coke was to be shipped to his furnace at the rate of five cars per day, so as to enable him to unload conveniently. Either his stipulation was overlooked or it was ignored. The coke company had 43 loaded cars on its sidings and demurrage charges were accumulating. Hence it sent forward the 43 cars in one consignment. When the solid train of 43 cars was delivered to the furnace company, the latter refused to accept more than 20 cars, until it had been assured by the seller that the latter would take care of any demurrage charges that might develop.

"Many a True Word—?"

POSSESSED of an unusual amount of common sense, Vice President Marshall, nevertheless, has a sense of irrepressible Hoosier humor. While President Wilson was on his western tour, the President's "only vice," Mr. Marshall, as the latter once inscribed in a book he presented to the chief executive, went to the union station in Washington as acting chief magistrate to welcome General Pershing. As his automobile neared the entrance to the White House grounds, only used by the President and distinguished visitors, the Vice President remarked:

"Now we'll see if we can get into Gompers' annex."

Bacteria Form Iron

YEARS ago Pasteur revealed the significance and dealiness of bacteria in disease, and the function that they perform in fermentation. It has remained for living scientists to discover the extent to which bacteria are engaged in tearing down and building up the earth's crust. It recently has been demonstrated that bacteria not only aid in the decomposition of rocks and in the formation of beds of chalk and limestone, but it now is evident that they are active agents in the deposition of iron ore. For instance, it is learned that much of the trouble which occurs in the operation of city water supply systems is due to iron-depositing bacteria, which clog the pipes with hard, thick crusts, and slimy layers of rust which are composed of millions of bacteria.

E. C. Harder of the United States geological survey, who has examined deposits of iron ore in many countries for the special purpose of determining their mode of origin, has recently made close studies of the action of bacteria in forming iron ores. He has found the so-called iron bacteria actively engaged in the deposition of compounds of iron not only in surface iron-bearing waters

but in mine waters to depths of several hundred feet and has made laboratory cultures of various iron-depositing bacteria. Mr. Harder describes the iron-depositing bacteria, gives the results of his laboratory experiments in bacterial iron deposition, considers the probable extent of the influence of bacterial action in forming deposits of iron ore, and gives a bibliography containing the titles of many papers on the work of bacteria in rock and ore deposition.

Purpose vs Rapacity

IN THESE days of high cost of living, Senator William S. Kenyon, of Iowa, who was in charge of the steel strike investigation, recalls that when he started to practice law in Fort Dodge he allowed himself 20 cents a day for food, a dime about 10 o'clock in the morning for coffee and rye bread, and a dime for two fried eggs and more rye bread about 4 o'clock in the afternoon. The senator could not avoid thinking of those days of rigid economy when he heard steel workers tell of wages they are being paid which by no means restrict them to such a modest diet.

Using Pipe for Frames

A NEW market for standard steel pipe is being developed among manufacturers of automobile starting and lighting equipment. It has been found that this pipe, when cut into 6-inch lengths, serves more satisfactorily than many other materials for starting motor and generator frames. After being cut to the required length the pipe is accurately bored on the inside. Recently a prominent manufacturer of automobile starting equipment in Indiana purchased 4000 feet of 4½-inch pipe for this purpose.

Unbusinesslike Methods

AN ILLUMINATING illustration of the intricacies of the red tape that enfold the efforts of buyers to obtain machine tools on sale by the government has just come to light. A manufacturer has a straight-sided press on order for a user on which six weeks delivery was promised but this time has expired and the best promise now is February. The user needs the equipment and will place it at once in production. In the tools offered by the ordnance department at Chicago is one that fills the bill exactly.

A dealer seeking to obtain it for the user was asked to submit a bid, which must be 80 per cent of the market price. This bid is to be sent to Washington where it will be compared with the bureau's idea of what the price should be and eventually a decision will be made whether this buyer will be allowed to take the machine. Meanwhile it is being withheld from production.

A business concern under similar circumstances would have a price set on the tool so that the buyer could decide at once, the transaction could be completed and the tool shipped all on the same day.

Opportunity In Steel

THE *New York Globe* sends out a reporter every day to ask a certain definite question of five people whom he selects at random in public places. A few days ago the question that he put was "What business or profession affords the best opportunity for young men?" The reporter went to the Pennsylvania railroad station in New York and put the question to a steel man, a superintendent of stevedores, a tailor, an actor and a draftsman. Of these men, the actor selected the profession of electrical engineer, and the tailor that of lawyer. The superintendent of stevedores selected the steamship business and the draftsman the profession of engineer in the erection of big buildings. The steel man, who was J. C. Williams, vice president of the Weirton Steel Co., Weirton, W. Va., came out unqualifiedly for the steel industry.

"There is no better business today," he said, "for a young man than the steel business. We need young blood more and more but its possessors must start at the bottom. The great trouble with our young men today is that they want to start at the top."

Stimulus of Victory

C. S. KOCH, new president of the American Foundrymen's association, vouches for this strike story:

A Lancaster, Pa. jewelry man, returning home from a business trip to New York, found that a strike had been called during his absence. He asked the elevator man, who happened to be an Irishman, why the men had struck. The latter replied: "I guess 'twas because they won the last one."

A Smokeless "Smoke House"

EDWIN F. SWEET, acting secretary of commerce, tells the following story on Sir Arthur Shirley Benn, head of the British mission, now on tour of the industrial centers of the United States, under auspices of the national chamber of commerce.

Mr. Sweet was host to the four foreign missions on a visit to Mount Vernon. After visiting the tomb of Washington and going through the historic mansion, Mr. Sweet and Sir Benn strolled over the grounds. As they approached some of the outbuildings, Mr. Sweet asked Sir Benn if he wanted to smoke, offering him a cigar. Sir Benn said yes and Mr. Sweet pointed out the smoke house of the old estate on which the words "smoke house" appeared as a guide to visitors. Sir Benn, who had spent much time in America and who Acting Secretary Sweet thought was familiar with American institutions like smoke houses, immediately started for the building, apparently intending to go inside and "light up."

It was not until Mr. Sweet explained that Sir Benn smilingly admitted it was "one on him."

Holds Unusual Meeting

An unusual meeting of the Newark Foundrymen's association, Newark, N. J., was held Dec. 3. It was participated in by the membership of the Gray Iron club and the Metropolitan Brass association of New York, and was called to bring the foundrymen of the Newark and New York districts closer together. The meeting was addressed by A. O. Backert, editor of *The Foundry,* whose subject was "Some Recent Experiences in England and France," particularly relating to the iron, steel and foundry industries in those countries. The meeting was held at the Downtown club, Kinney building, Broad and Market streets, Newark, and was preceded by a dinner.

The Russell Motor Car Co., Toronto, Can., reports a net profit for the year ended July 31 of $457,878 compared with $628,581 for the previous year. Cash on hand dropped to $183 from the $175,461 of the previous year, but investments in war loans were increased from $321,947 to $556,079.

Industry Quiet in Northwest

Shipbuilding Active But Expected to Slacken Soon—Expansion in all Lines Contemplated—Labor Unrest is Big Factor Hindering Production But Conditions are Tending to Improve Markets—Iron and Steel Strong

SEATTLE, Nov. 25.—With war work practically completed, industrial conditions in the northwest have materially quieted down. There is some contention that shipbuilding will continue to a considerable degree at the chief ports but the consensus of opinion is that early in 1920 the yards will have finished their contracts and only plants doing repair work will be maintained. An exception however, is the G. M. Standifer Construction Co., of Vancouver, Wash., which recently obtained a contract with the Green Star Steamship Corp. of New York for five 9500-ton steel cargo carriers. At present practically all the jobbing foundries are running five days a week with reduced crews, the reduction in the number of men employed being from 10 to 75 per cent. This situation is expected to change for the better about the first of the year. Assurance of an improvement over prewar times is indicated by the fact that many companies are taking up new lines to utilize the extensive facilities and equipment installations made for war purposes, while others are constructing new plants and additions.

At Everett, Wash., the Sumner Iron Works, which filled extensive war orders, is adding to its lines the manufacture of tractors. It has grown steadily since its plant was erected and recently filed notice of its intention to redeem $100,000 of preferred stock, leaving its capital stock at $200,000.

Expansion is in Progress

The Vulcan Mfg. Co., Seattle, has added to its line steel dump bodies for trucks. To better operate and increase output, the Rex Metal Works, Seattle, has purchased the Mars Smelting Co., which has been engaged in the manufacture of brasses and bronzes while the former has been smelting and refining babbitt, or antifriction metals, solders, type metals and special mixtures. The Western Rolling Mill Corp., recently organized at Seattle, will soon start the erection of a 60 x 700-foot steel plant with three open-hearth furnaces of 50 tons capacity each and two continuous furnaces. Installation of an experimental electric furnace is also a probability. The installations will include nine and 22-inch mills for turning out bars, rounds, flats and small angles.

The Consolidated Mining & Smelting Co. with headquarters at Trail, B. C., is reported considering plans for two concentrating plants, one at Rossland and the other at Kimberley. The Kimberley installation will have a capacity of 10,000 tons of copper ore daily. Plans for the Rossland installation have been under consideration for several months. The capacity considered at the outset was 1500 tons, but the quantity of low grade ore to be dressed is said to warrant the use of a 5000-ton plant. The cost of a 1500-ton plant is estimated at $500,000.

The largest magnesite mill in the United States is in operation at Chewelah, Wash., where American engineers discovered one of the largest known magnesite deposits in the country, lying in a belt 18 miles long and a quarter of a mile wide. More than $3,000,000 are now invested there and large quantities of the mineral are being shipped. While the demand for domestic manganese ore has slackened, Montana contributed more than 1/3 of the high grade ore shipped during the first six months of 1919, or 16,026 tons.

Lumber Industry Most Active

Lumbering is the greatest industry of the Northwest. The demand for lumber, especially for rail shipment, now is well under way among the mills of western Oregon and western Washington and gives every prospect of continuing with increased proportion. This is the one exception to the quiet prevailing. The 125 mills contributing to the report of the West Coast Lumbermen's association accepted orders during a recent week for 6,447,843 feet more than actually cut. Inquiries are brisk and the sales movement which usually sets in about the first of the year is making good progress. The prevailing car shortage is preventing the mills from keeping shipments on a level with new business. The rail movement for one week of November was 1495 cars—1111 cars less than the rail orders. The mills now have an aggregate of 8723 cars of unfilled rail orders on their books and no immediate relief from this shortage is in prospect, although more cars will probably be available toward the first of the year. The industry is running almost at capacity.

Congress has agreed upon $6,000,000 for construction work on the Alaska railroad during the coming year. This is of interest to the Northwest as the ports of the section handle all shipments to and from that territory. It is anticipated that opening of the coal, timber, mineral, oil and agricultural sections is not far distant. This means industrial prosperity not only for Alaska but for the Northwest as it assures an unlimited supply of raw materials.

Northwest centers are looking well to the supply of power necessary to operate industries. At the present time Seattle is constructing a 35,000-kilowatt unit of the Skagit river project. This is a small fraction of the horsepower available from this source and development will be continued as the power is needed. At the same time the city is adding largely to its existing plants and private concerns have well developed properties. Tacoma recently voted to acquire the Lake Cushman power site with an ultimate capacity of 75,000 horsepower. At Spokane and Portland private enterprise has developed large units with large reserves of power possibilities to draw from. The Pacific Power & Light Co. is spending $750,000 at Astoria, Oreg., in the construction of a power, light and gas plant. The Sherman County Light & Power Co. is installing a $150,000 steam plant at Centralia, Wash. The Idaho Power Co. has placed orders for machinery necessary for the installation of an 8000 horsepower addition to its power plant at the Thousand Springs on the Snake river. The potential water power of the Northwest is practically without limit and the industrial future of the section in this respect is secure. It has been found necessary however to speed up development in some centers as the demand already exceeds present facilities.

Strikes Hinder Production

One of the chief reasons for the failure of the Northwest to get more fully under way during the past year with a program of reconstruction has been the numerous strikes that have followed in rapid succession. The radical elements have been directing labor union movements for some time, and through their activities contracts have been broken and demands made that are impossible for employers to meet. These leaders and their organs openly announce that it is not a question of better wages and better working conditions, but that they are not so concerned in winning strikes as they are to bring about intolerable conditions in

the hope that eventually the industries will be turned over to the workers for operation. The strike which started labor on this rampage was that which began in the shipyards at Seattle and out of which grew an attempt to carry through a general strike last February. The latest strike involving between 4000 and 5000 men, was that of the building trades in Seattle, which was recently called off by the complete surrender of the union and the return of the men to work under the old scale, and by an open shop policy going in effect.

By reason of the difficulties being experienced by employers throughout the district in getting business under way where union labor is concerned, the open shop is becoming a very attractive proposition to these foremen and this is why the outlook for a better condition in the district is becoming more satisfactory. The United Metal Trades association, employing in normal times more than 7000 men in Oregon and Washington since it was organized, 18 years ago, has stood for and maintained the open shop policy. Numerous attempts have been made to unionize its shops but all have failed. The going wage with additional compensation for efficiency is the rule. The result is industrial peace with satisfactory output.

The iron and steel market is not very active. One dealer reports No. 1 foundry pig iron at $49.20 to $50 a ton Seattle. Another reports the market strong and rising, giving a price of $51 for No. 1 foundry, Seattle. The demand for iron on the coast is not as great as it should be. Business is being done on a strong competitive basis. Uncertainty in shipbuilding and the fact that the usual normal channels are not functioning to full capacity are causes for the dull period.

Prices Tending Upward

Coke is hard to get because of the inability to procure rolling stock. The government will not allow shipments west of the Mississippi river in open top cars and others are scarce. The coke market is firm and prices are going up. The proportion of eastern coke used varies but little from other times and it is holding its own with local coke.

A limited amount of steel bars is moving at 3.60c Seattle for domestic use and at 2.95c Seattle for export. There has been little movement of recent date in cast iron pipe but there are some indications of a revival in the demand. Seattle is to substitute iron mains for wood in a considerable section of the city at a cost of approximately $460,000 and Bellingham, Wash., is asking bids for 81 tons of 8-inch and 55 tons of 12-inch cast iron pipe for watermains. Foundry iron scrap, broken to 150 pounds and less, is being quoted at $35 a ton with the tendency upward. There is considerable moving. The market in steel scrap is upset but some was sold recently for export at $24.

The Seattle representative of the Kawasaki Dockyard Co., Kobe, reports that 30,000 tons of steel material representing an expenditure of $2,700,000 and ordered from the United States Steel Corp. is to be handled through the port of Seattle.

Approximately 1500 tons of steel produced at the Seattle plant of the Pacific Coast Steel Co. was recently booked for shipment to the Orient. Other shipments have been made and more are contemplated.

Tin Plate Mill

Being Built in Canada Making Progress—Want Tariff Body

Toronto, Dec. 2.—Good progress is being made in the construction of the tin plate plant of Baldwins, Ltd., on the site formerly occupied for the manufacture of munitions by the British Forgings, Ltd., under the supervision of J. C. Davies, managing director. The work will cost approximately $1,250,000 and the first unit to be installed provides for eight mills. This will be doubled at a later date and the company intends ultimately to have 42 mills in operation with a view to an annual output of 200,000 tons of tin plate, sufficient to provide for all Canadian requirements. It is hoped to commence actual production by next summer with a working force of about 1800 men. It will be necessary to bring from England a number of skilled workmen as a nucleus of the force. A power wheel of 125 tons is being installed and the company will be a large user of electricity, although it is uncertain whether it can be secured at a sufficiently low cost to render it economical for steel manufacture. The Canadian branch of Baldwins, Ltd., will be known as the Baldwins Canadian Steel Co.

On Nov. 25 deputation from the executive of the Canadian Manufacturers' association had an interview at Ottawa with Sir George Foster, Canadian minister of trade and commerce, and other members of the government. They strongly urged the creation of a permanent tariff commission of experts to act in an advisory capacity in connection with tariff revision. Last session Sir Thomas White, then finance minister, proposed an inquiry into the workings of the tariff by the cabinet to which the government has apparently committed itself. The manufacturers strongly opposed this proposition urging that were the government itself to undertake the investigation it would have the effect of stirring up political agitation and accomplish no beneficial results. It is understood that the government adheres to its plan for a cabinet inquiry, but may eventually appoint a permanent tariff commission.

The Canadian board of commerce has rendered a decision in the case of the Laco-Phillips Co. which charged the Canadian General Electric Co. of Toronto with making use of its patent rights for the manufacture of tungsten wire filaments to restrain trade and commerce in relation to the manufacture of incandescent electric lamps. The board finds that the Canadian General Electric Co. has a monopoly by patent of tungsten wire filament, but not of ordinary electric tungsten lamps, that the company has not operated its monopoly fairly, and that the Laco-Phillips Co. is entitled to have the case reported to the minister of justice under the Combine act, which will be done unless the parties can come to an agreement. The law provides that when patents have been used in restraint of trade the minister of justice shall apply to the Exchequer court for a revocation of the patent.

The United States government has been settling with Canadian companies which had entered into contracts for the manufacture of war material. The process of making adjustments has been rather lengthy in many cases, and there was a good deal of impatience in connection with the delay. The work has been proceeding slowly, however, and several adjustments of importance have been announced. A final settlement was made with the directors of Motor Trucks, Ltd., Brantford, Ont. The plant was erected in the final months of the war, and had barely commenced production when the armistice was signed. Expensive equipment was installed and the plant was regarded as one of the finest of its kind in Ontario. The United States government retains possession of the building and an effort will be made to dispose of it.

The Electric Steel & Forge Co., Cleveland, through A. B. Leach & Co., Inc., is offering $500,000 of 7 per cent preferred stock at 98 accompanied by a bonus of common shares. The proceeds will be used to complete buildings now under construction, the purchase of equipment and to supply additional working capital.

Here and There in Industry

Live Information Which Records the Expansion of Various Lines of Productive Enterprise

THE Booth Electric Furnace Co., Monadnock building, Chicago,has opened the following district offices in a number of cities for the sale of electric furnaces for melting steel, iron and nonferrous metals.

For New York and New England, Edward B. Stott & Co., Flatiron building, New York City, with E. F. Tweedy, secretary of the company directly in charge; for eastern Pennsylvania, New Jersey, Maryland, Delaware and southern Atlantic coast states, the Northern Engineering Co., 308 Chestnut street, Philadelphia, with F. W. Doran in charge; for northeastern Ohio, western Pennsylvania and western New York, Charles L. Foster, formerly sales manager of the Electric Furnace Co., Alliance, O., with offices at 879 The Arcade, Cleveland.

* * *

THE Louisiana Steel Co. is to be organized with works in Shreveport, Louisiana, through the Louisiana Finance Co. of the same city, which is to purchase half of the proposed $10,000,000 capital stock. Col. L. P. Featherstone of Beaumont, Tex., and associates in the Texas Steel Co., are the organizers. In connection with the steel plant it is proposed to mine the iron ore in 7000 acres of land purchased in east Texas.

* * *

WHEELOCK LOVEJOY & CO., INC., Cambridge, Mass., announce the opening of two new branch warehouses. One which will be located in Chicago will open Jan. 1, and will be in charge of E. P. Gaffney. The other, located in New York, will open Dec. 15 and will be in charge of W. H. Wallington. The company deals in tool steel, and other high-grade alloy steels.

* * *

THE Pittsburgh Knife & Forge Co., Pittsburgh, recently purchased 16 acres at Coraopolis, Pa., on which it will erect two steel frame buildings, 100 x 700 feet each. The company plans the expenditure of $500,000 on the construction and equipment of these buildings, and is in the market for a crane, seven steam drop hammers, as well as a complete line of forging machinery. When completed this plant will be used in the production of large forgings and the present plant of the company in Pittsburgh, North Side, will be devoted exclusively to the making of the lighter forgings.

* * *

THE Fort Worth Drilling Tool Co., Forth Worth, Tex., is planning to invest several hundred thousand dollars for building and equipping a tool works in that city. The organization is new and was formed with $400,000 capital, of which $350,000 is estimated as the cost of the buildings, machinery and site. Numerous contracts are reported already signed with companies operating in the Texas oil fields.

* * *

SINCE Dec. 1, the American Iron Products Co., Inc., 107 Liberty street, New York, has been operating its nonferrous department. It is in charge of a trained brass and copper man. The purpose of the department is to take over and handle direct, the brass and copper business, heretofore originating through the company's branch offices in foreign countries, which has been diverted through another company, specializing in nonferrous metals.

* * *

THE Rolls-Royce of America, Inc., which has decided to locate in Springfield, Mass., has announced plans for its first plant and engineers are now at work on the details. Five buildings will constitute a group, the first unit occupying 74,000 square feet. They will be of sawtooth type of construction, one story high each. The machine shop will have 32,000 square feet, assembly shop 20,000, test shop 11,000, hardening shop 5000, and office building 6000. The latter will be of steel, wood and brick construction.

* * *

ORIGINALLY formed in 1917 for the purpose of specializing in the manufacture of high speed steel, the Syracuse Alloy Steel Co. has found it necessary to reincorporate. The name of the new company is the Syracuse Alloy Steel Co., Inc., and property has been purchased in the eastern part of Syracuse on which a plant now is being built which will permit of bringing production more in keeping with demand for its output. The plant will be equipped with a sufficient number of additional hammers and rolls. In addition to manufacturing the high speed steel itself, the company manufactures forged side and end milling cutter blanks, etc., as well as forged cutter blanks for special shapes of cutters as required by individual customers. The new plant will allow the company to enter further into the production of intricate forgings, to which it is giving considerable attention. The plant will be ready early in 1920.

* * *

SALES representatives of the Independent Pneumatic Tool Co., Chicago, from all over this country and Canada, met in convention recently at the company's general office, 600 West Jackson boulevard. The meeting was in charge of R. S. Cooper, vice president and general sales manager, other officials assisting being: John D. Hurley, president; F. W. Buchanan, secretary; Adolph Anderson, assistant to president; F. B. Hammerly, works manager; Axel Levedahl, consulting engineer, and R. A. Norling, C. D. An entire day was spent at the company's plant, visiting the different mechanical departments. Ways and means for improving the output as well as service to customers were discussed.

* * *

PLANS have been completed for erection of a plant for the Bridge & Beach Mfg. Co., St. Louis, stove manufacturer, which will embrace all modern improvements in the line of industrial construction. The plant will be comprised of a molding shop, 150 x 322 feet, a cleaning and grinding building, polishing and nickeling building, japanning room, a 3-story mounting building, 54 x 318 feet and a 3-story warehouse, 120 x 255 feet. A center group of buildings will comprise the boiler house, engine house, enameling building, pattern storage building and pattern shop. A storage yard for pig iron, coke, sand, etc., will be provided. The entire plant will be electrically operated from power generated at the plant. The total floor area of the buildings will be 240,000 square feet. The company will employ 700 men and expects to manufacture approximately 100,000 stoves a year, including furnaces.

Here and There in Industry

Live Information Which Records the Expansion of Various Lines of Productive Enterprise

OCCUPYING the entire top floor of the Telford building, Waterbury, Conn., the Holaday-Telford Co., Inc., designer and manufacturer of metal patterns, core boxes, pattern plates, tools, jigs, etc., will erect its own plant early in 1920. Incorporated at $10,000, the company announces it will increase the capitalization at an early date to permit of expansion and additions to equipment. A. E. Holaday is president and manager; Joseph Telford is treasurer and W. S. Brakenridge is secretary. For about 12 years prior to Oct. 1, 1919, Mr. Holaday had charge of the pattern department of the Eastern Malleable Iron Co., which operates plants at Bridgeport, New Britain and Naugatuck, Conn. The Holaday-Telford company's shop superintendent formerly was with the Singer Mfg. Co., in charge of the pattern, tool and jig departments. V. J. Richardson, who has been with the Sargent Co., New Haven, Conn., in the experimental department, is an expert on builders' hardware, locks and keys.

* * *

WORK recently was started on the construction of a new machine shop for the Whitmore Machinery & Foundry Co., Menasha, Wis. It is to be a modern building 60 x 116 feet and will be located west of the company's new foundry. Outer walls will be of brick to a height of five feet, from which point construction will be of steel frame and glass. The contract for the work was awarded to the C. R. Meyer & Sons Co., Oshkosh, Wis. A traveling crane will be installed, which will operate the full length of the shop.

* * *

THE Gerstner Boiler Works, Pittsburgh, has doubled its capital to $200,000, to take care of increasing business. Additional steel buildings, 100 x 220 feet, are being erected. The company is working on an order of 152 portable boilers for the western oil trade, for immediate delivery. It also is building 30 steel locomotive tender tanks for export and has booked a large order for steel ship masts for 16 vessels now under construction, as well as a number of smaller orders. Its McDonald plant, which is equipped for the re-ending of boiler tubes exclusively, by a patent process controlled by the Gerstner company, is running 100 per cent.

* * *

FOR the present, the Danielson Tool Co., Wausau, Wis., will devote its attention to the manufacture of a line of 200 different tools and devices for special purposes designed for Ford garages and repair shops. The concern is incorporated in Wisconsin with a capital stock of $100,000 and is a reorganization of the Danielson Engine Works of Chicago, founded in 1915 by Frank Danielson, who becomes vice president of the new company. T. H. Jacob, of Wausau, is president; John M. Lull, secretary, and George Stolze, treasurer. A one-story, fireproof shop, 70 x 200 feet, has been acquired. Castings are being purchased from Wausau foundries, but later the Danielson company intends to install its own casting facilities.

* * *

WITH the Vulcan Plow Co., as its parent company, the Vulcan Implement Factories, Inc., Evansville, Ind., recently was organized to manufacture and sell a complete line of tractor-drawn tillage tools for all makes of tractors. A 4-story plant is being erected for the new enterprise, adjacent to the Vulcan Plow factory, as well as a 1-story forge shop, etc. The Vulcan Plow Co. will continue to manufacture horse-drawn tillage tools, turning over to the new company the line of tractor plows it has been manufacturing for some time. This new plant will probably be in operation by Jan. 1, 1920. Richard Rosencranz is president of the new company; J. H. Berryhill, secretary, and G. A. Trimble treasurer. It is capitalized at $300,000.

* * *

AMONG recent incorporations noted is that of the Kuniholm Mfg. Co., Riverside street, Gardner, Mass. This company, capitalized at $50,000, will manufacture children's vehicles, specializing in hardware, wheels, gears, etc. A plant now is being erected and is expected to be ready for installation of machinery about Nov. 1. This machinery and equipment will include a forge furnace, 13-inch lathe, 16-inch shaper or crank planer, three or four different sized presses, automatic wire cutting and straightening machines, welding machines, bench drills, motors, etc. Officers are: President, Hugo M. H. Kuniholm; secretary and treasurer, C. Harry Kuniholm. In addition to these, Martin Kuniholm and W. Gardner Kuniholm form the board of directors.

* * *

STARTING with sizes from 1 to 7½ horsepower, the Zobell Electric Motor Corp., Garwood, N. J., will manufacture both alternating and direct current motors. Although incorporated last April with a capital of $250,000, the company only recently completed its designs and now announces its intention to incorporate in small motors, many of the refinements found in the larger sizes. Shafts will be removable without disturbing either the core or commutator. If necessary the commutator may be removed without disturbing the shaft or core. The company intends to specialize on special purpose motors, designed for the machine on which they are to be used and present equipment permits an output of from 200 to 300 motors monthly. Fred G. Bell is president; A. T. Zoebisch is treasurer and F. E. Bucker, secretary and superintendent.

* * *

AS PARTNERS, consulting engineers Robert D. McCarter and William L. Cooper, will operate at 165 Broadway, New York City, under the name of McCarter & Cooper. Purchasing for clients will be conducted from 50 Church street, New York City. Mr. McCarter was chief engineer for the General Electric Co., in London, England, prior to 1902. From that time until 1914, he maintained a consulting engineer's office in London, serving the European Westinghouse companies. He also was president and managing director of the Russian Westinghouse Co. He opened an office in New York in 1914. Mr. Cooper who established an office in New York in 1917, was European manager and chief engineer for Robert W. Hunt & Co., for the 15 years preceding that time.

Market Tightens

In Coal-Tar Products Because of Strike—Sulphate Advanced

New York, Dec. 2.—Strength in the coal tar products market is being further accentuated by developments in the coal situation. The refusal of the miners to accept the wage increase proposed by fuel administrator has discouraged the hope that a normal output at the mines will materialize soon. As a result the ovens are dipping into their coal stocks more sparingly, thus influencing production.

Prices generally are tending upward, and in sulphate of ammonia quotations have advanced. The little spot material available is quoted at $3.85 to $4, f.o.b. producers' plants,

Coke Oven By-Products

Spot

Per Gallon at Producers' Plants

Pure benzol	$0.25 to .29
Toluol	.26 to .30
Solvent naphtha	.22 to .27

Per Pound at Producers' Plants

Phenol	nominal
Naphthalin, flake	0.06½ to .07½
Naphthalin, balls	0.08½ to .09½

Per 100 Pounds at Producers' Plants

Sulphate of ammonia	$3.85 to 4.00

Contract

Pure benzol	$0.25 to .29
Toluol	.26 to .30
Solvent naphtha	.22 to .27

Per Pound at Producers' Plants

Phenol	nominal
Naphthalin, flake	0.06½ to .07½
Naphthalin, balls	0.08½ to .09½

Per 100 Pounds at Producers' Plants

Sulphate of ammonia	nominal

for domestic consumption, a rise of about 20 cents, and $4.75 to $5 in double bags at the eastern seaboard, for shipment abroad. Owing to the extent producers are booked up, little contract business is being offered, and future prices are more or less nominal.

There has been no change in offerings and of benzol an advance is regarded likely in the near future. Pure benzol is quoted at 25 to 29 cents, and 90 per cent at 22 to 24 cents. These prices apply to both spot and future material.

Dye interests are coming forward as the largest buyers of naphthalin. The drug trade has now practically brought its buying season to a close. Naphthalin is scarce, at 6½ to 7½ cents in flakes, and 8½ to 9½ cents in balls. Solvent naphtha and toluol are in steady demand. Supplies are fairly plentiful. Solvent naphtha is holding at 22 to 27 cents, and toluol at 26 to 30 cents.

Southern Plants Active

Birmingham, Ala., Dec. 2.—Steel mills operations in the South are steady and there is a strong demand for the various products. Some export steel is moving, the Gulf States Steel Co. having shipped during the past week 1700 tons of billets from the Gadsden plant, bound for Liverpool, via Pensacola. Statement is made in this section that no effort is being made to get export business, as the active demands of domestic consumers will be supplied first. The fabricating plants of Tennessee Coal, Iron & Railroad Co. and the Birmingham Steel Corp. both are working on shapes for ship construction at Mobile. The latter company is taking on commercial work and the expectations are that tanks for use in the Texas and Oklahoma oil fields will bring some round tonnage to the district in the near future.

Erecting New Foundry

Erection of a new foundry building for Richard Roberts & Son, proprietors of the Delta Foundry & Machine Works, Delta, Pa., is expected to be completed by Dec. 10, and will be put into immediate operation. This building replaces one which was destroyed by fire Nov. 2. Efforts of the firemen prevented the blaze from spreading to other buildings of the plant, which include a machine shop, warehouse and pattern shop. The company manufactures steam and electric hoists and canning machinery, and has been in business for the past 35 years.

Opens District Office

The Hyatt Roller Bearing Co. has opened a district office in Cleveland, located at 309 Marshall building. It will conduct a general application department which will consider roller bearing specifications for everything but automobiles and tractors. C. L. Newby, who has represented the company for the past year in the Cleveland territory, is in charge.

Strikers Vote to Return

Striking employes of the H. W. Johns-Manville Co., Manville, near Somerville, N. J., held a meeting on Nov. 25 and decided to return to work at the same wages and under the same conditions as prevailed before the strike was called. The strike lasted 15 days and kept 1500 workers out of employment. It was characterized by considerable violence and 16 of the strikers are in jail serving terms for offenses committed during the trouble.

Steel Strike Handicaps Canadian Industries

Washington, Dec. 2.—Consumers of American steel products in Canada are pinched by shortage of material more now than at any time during the course of the steel strike in the United States, according to Felix S. S. Johnson, American consul at Kingston, Ont., in a report to the bureau of foreign and domestic commerce under date of Nov. 17. Deliveries have been retarded from the different producing areas of the United States, this being particularly true with regard to bars, sheets and tubes, he reports. All available warehouse stocks have been drawn upon to relieve the situation. He says there appears to be no assurance of an approximate date at which improvement will be made. Shipments continue to go through but in insufficient quantities to meet requirements. Buyers of sheets probably will be unable to obtain any sizable shipments until the second or third month of the next quarter. Some fair sized shipments, known to be on the way to Ontario customers, will ease the situation somewhat and distributors are making efforts to get together all supplies of sheets that are available in order to keep customers supplied. Such stocks are for the most part very meager, Mr. Johnson says.

Plates have been going through occasionally and up to Nov. 17, Ontario shipyards were able to proceed without interruption in the initial stages of the construction of vessels ordered for the Canadian merchant marine.

Expect Award Soon

Washington, Dec. 2.—Decision is expected shortly on the award of contracts for 7440 tons of special treatment steel plates and 3960 tons of nickel steel plates for battleships Nos. 49, 50, 51 and 52. The navy's bureau of supplies and accounts last week opened tenders submitted by the Carnegie Steel Co. and the Carbon Steel Co., the only bidders, whose quotations were, respectively, 11.12c and 8.84c and 11.50c and 9.25c per pound on the two lots.

What Does Share Drop Portend?

Stock Market Slump Was Due to Collapse of Over-Expanded Loan Position and Does Not Forecast Depression of Business is Belief—Wall Street Not Functioning Normally—General Financial News

BY JOHN W. HILL, FINANCIAL EDITOR

DOES the recent stock market crash and the consequent subdued tone of speculative activity forecast within a few months a letdown in commodity prices and industrial prosperity? Or if not, then is the share market to be discredited as a prognosticator of developments in the broader business world? These are questions which have formed themselves in the minds of observers since the November epidemic of liquidation began. In normal times they would be more easy to answer, but the war has left conditions in finance and business uncertain in the extreme.

Those who have equal faith in Wall street's ability to discount the future and in the undimmed prospects for continued industrial activity, assert that the stock market for some time has not been normal—but rather suspended its forecasting functions while surrendering itself completely to an orgy of unreasoning speculation.

With the unhealthy elements "shaken out" and with banking credit under reasonable control, it is asserted that the market may be expected once more to begin to reflect in a normal way the real financial sentiment. Accepting this view, it would be folly to attach undue importance to the recent collapse of share values as a forerunner of what may happen in the business world within the next few months.

Speculative Bubble Pricked

The speculative bubble was pricked by the federal reserve board in causing rediscount rates on war paper collateral to be advanced, which together with the tying up of millions of banking credits in goods held in New York harbor while the strike was on, curtailed available money for stock market purposes. The call loan money rates advanced to as high as 30 per cent and as a consequence the over-extended situation, the speculative position of the market was corrected in large measure.

An interesting feature of the situation is the fact that for weeks the share market seized upon the most disquieting news such as industrial unrest, and possibility of peace treaty rejection, and professed to see in them only sources of cheer. That was while prices were still singing upward. Then when the crash came every wire served to sink Wall street's spirits into deeper gloom.

No Price Drop Seen

For the same thing to happen to industry as has taken place on Wall street would necessitate a drop in prices. A number of the strongest possible reasons militate against such an eventuality within the near future, at any rate. In the first place the world's production is sadly in arrears of demand and consumption; next the tremendous inflation of currency and circulating credits both in this country and in Europe, toward deflation of which no step has been taken, will help keep prices high; and last the influence of taxes upon prices is of great importance. Although the importance of taxes as a factor in prices is becoming more and more to be recognized, the problem of how to reduce them will remain unsolved so long as the government needs are so vast.

Perhaps the two most serious problems facing the country are those of the industrial unrest and of demoralized foreign exchange. Were it possible for the cost of living to be kept where it is for a few months the labor question, with industries going and good wages prevailing, the unrest should subside appreciably during the winter. While wages are an overwhelming factor in the prices of commodities another element which grows out of the shortage of goods and which has been exercising a powerful influence on the cost of living in recent months, is that of speculation. Commodity speculation sending prices out of reason and tying up banking credit is just as harmful as stock market speculation and the federal reserve board is believed to be contemplating means of curtailing credits for this purpose.

The European missions which came to the United States to stimulate interest in the extension of credits abroad have returned home, leaving behind them a newly formed committee of powerful American bankers pledged to do all in their power to help Europe. Although the delay in the peace treaty ratification is discouraging to plans in this direction, it would seem that the main obstacle in the way of successful flotation of foreign securities in this country, lies in the indifference of American investors.

So pronounced is this attitude that many bankers believe that it will be necessary for the government to step in the breach and save Europe with credits and raw materials. The state of the foreign exchange doubtless will increase imports to America and reduce exports, yet the demand for commodities in this country is so great that there is little danger of a damming up of goods and a break in prices. Respecting foods, however, export curtailment may operate to reduce prices, a development which would greatly aid the industrial situation through reducing the cost of living. The head of the hog buying department of Armour's has predicted $12 hogs for the winter months, due to decreased exports.

Confirm Sale of Assets of J. V. Thompson

Sale of the assets of Josiah V. Thompson, Uniontown, Pa., bankrupt, was confirmed provisionally recently by William R. Blair, referee in bankruptcy. In one order the referee authorizes the sale of certain specific properties of J. V. Thompson to William M. Hudson and others. In the second order he authorizes the sale of the remainder of the real and personal property of Mr. Thompson to the Piedmont Coal Co. for $5,000,000. In this sum was included $2,600,000 personal property and $2,000,000 in real estate and coal lands in Pennsylvania and $1,000,000 in real estate and coal lands in West Virginia. Possibility of a hold up of the sales still remains for the orders of the referee and do not finally become effective until next week, time being allowed for filing exceptions in the United States district court of Pittsburgh. Sale of the West Virginia property recently was opposed by Thompson creditors in that state and the possibility of further contest is not yet past.

Savage Arms Net Falls

The Savage Arms Corp., Utica, N. Y., for the three months ended Sept. 30 reports surplus, after charges, federal taxes and preferred dividends of $168,704 as compared with $443,611

earned in the preceding quarter and $249,918 for the corresponding quarter last year. For the nine months ended Sept. 30 the surplus available for common dividends amounted to $1,455,097.

Replogle Steel Elects

New York, Dec. 1.—Officers of the newly organized Replogle Steel Co. have been elected as follows: Chairman, J. Leonard Replogle; president, W. H. Brevoort; vice president, Charles MacNeill, who is president of the Utah Copper Co.; secretary, S. H. Bell; treasurer, L. K. Diffenderfer.

W. S. Pilling, Pilling & Crane, Philadelphia, will be added to the board of directors of the Replogle Steel Co., as well as to the board of the Wharton Steel Co., and the executive committee of the Wharton Steel Co., a subsidiary of the Replogle Steel Co., will be comprised of J. Leonard Replogle, W. H. Brevoort, F. K. Sheesley, and W. S. Pilling.

The present directorate of the Replogle Steel Co. is as follows: J. Leonard Replogle, W. H. Brevoort, Harry Payne Whitney, General T. Coleman du Pont, Charles MacNeill, L. W. Baldwin, president of the Empire Trust Co., H. F. Sinclair, president of the Sinclair Consolidated Oil Co., Mortimer L. Schiff, Kuhn, Loeb & Co., and Carl J. Schmidlapp, vice president Chase National bank.

Stock Is Offered

To complete buildings now under construction, for the purchase of equipment, and to acquire additional working capital the Electric Steel Forge Co., Cleveland, is offering $500,000 of 7 per cent preferred stock accompanied by a bonus of common. Upon completion of contemplated additions the company will have an annual capacity of 14,000 tons of electric steel ingots. Three new heating furnaces are being installed. In 1918 the company purchased the Crucible Steel Forge Co., Cleveland.

Plans New Financing

Directors of the General Motors Corp. have authorized a new issue of 7 per cent debenture stock in exchange for the present 6 per cent debenture stock and an issue of 50,000,000 shares of common stock of no par value, of which 14,800,000 will be issued in exchange for the present shares of $100 par value. The plan is subject to the ratification of the stockholders at a special meeting called for Dec. 20. The holders of the 6 per cent debenture shares now outstanding will be given the privilege of subscribing to the new debenture stock at par on the basis of two new shares for one old share, which will have the effect of doubling the outstanding debenture stock and represents financing of $90,000,000 for the corporation. A statement issued by the company says that a careful forecast of the future "indicates that for the company to continue occupying its leading position in the automobile industry large capital investments will be required. The plan will give the company $85,000,000 in cash, which added to present cash assets will give it a total of $175,000,000, "ample to provide for normal expansion to properly develop recently acquired lines and to maintain cash reserves sufficiently large to care for a gross business for 1920 of $800,000,000.

Canadian Car Will Drop Ship Construction

Shipbuilding will be dropped as one of the activities of the Canadian Car & Foundry Co., Montreal, following discouraging results from the construction of one steamship since the armistice, according to the statement of President W. W. Butler, in the annual report of the company. The report shows that for the year ended Sept. 30 gross sales were $33,000,000 as compared with $45,233,000 in 1918. Earnings last year were $2,993,470 against $4,617,390 for the previous year. The company net working capital was $10,363,976 showing a gain over the $9,028,964 of the year before. Because of the necessity of pursuing a conservative course and the fact that taxes, as yet undetermined, will prove a strain on the company's cash position, directors have decided to make no payment of preferred dividends in arrears at present.

Colorado Fuel Earnings Show Some Slump

Without allowance for depreciation but after interest, sinking fund and tax charges, the Colorado Fuel & Iron Co., Denver, reports a surplus of $544,099 for the quarter ended Sept. 30, compared with $627,154 earned in the preceding three months and $959,404 in the corresponding quarter last year. For the nine months ended Sept. 30 the surplus amounted to $1,572,637.

Increases Capital

For the purpose of developing its business of installing and manufacturing electro plating equipment, the Galvanizing Corp. of America, 244-252 Eagle street, Brooklyn, N. Y., recently increased its capital. The company expects to be in the market shortly for gears, machine tools, electric generators and motors.

To Enlarge Business

In order to care for increased business, the Rotospeed Co., Dayton, O., manufacturer of duplicating machines and supplies, contemplates increasing its capital. J. A. Oswald, president and treasurer of the firm, stated that none of the increase will be used for the erection of plant additions or the purchase of additional machinery and equipment.

Will Make Springs

Capitalized at $10,000, the Union Spring Mfg. Co., 101-105 Bryant street, Malden, Mass., recently was incorporated to manufacture and deal in springs of all kinds. Officers of the company are: President, Abraham Blatt; treasurer, David Yessin, and clerk, Abraham S. Goldman.

Financial Crop Ends

VALENTINE WINTERS, president of the Winters National bank, Dayton, O., has been appointed receiver for the Barney & Smith Car Co., on petition of Ballman & Irvin, Cincinnati. Suspension of the business of building and equipping both freight and passenger cars, the chief activity of the company, has brought about its difficulties.

* * *

Stockholders of the Reading Car Wheel Co., Reading, Pa., re-elected their officers as follows: President, H. H. Huyett; secretary and treasurer, W. C. Mullett; general manager, John W. Bowers; directors, H. H. Huyett, W. C. Mullett and E. J. Coleman, of Buffalo, and J. B. Bowers and L. B. Shofer.

* * *

An offering of $5,000,000 of 7 per cent cumulative preferred stock has been announced by the Timken Detroit Axle Co., the portion not taken by the stockholders to be offered to the public at 100 and accrued dividends. The company's sales are said to have increased from $3,263,518 in 1910 to $34,033,564 in 1918.

* * *

Stockholders of the American Bosch Magneto Co., Springfield, Mass., will be given the right to subscribe to 30,000 shares of new stock at $100, it is announced, as a result of a decision to increase the number of shares from 60,000 to 80,000. The right to subscribe is on the basis of one share of new stock for each three now held. Proceeds will be used to retire $1,500,000 of outstanding notes and to expand the company's capacity.

Greatest Year

In Steel Industry's History Coming, Says President of Interstate

Improvements and extensions by the Interstate Iron & Steel Co., especially at its plant at the Calumet river and 118th street, Chicago, will involve the expenditure of about $2,500,000 during the coming year. The company recently disposed of its rerolling mill at Marion, O., to the Pollak Steel Co and will center its activities in the three plants it operates in Chicago. The proceeds of the sale of this mill will assist in financing the Chicago extension.

This could have been done readily from earnings and surplus resources had it been desired as the company has the proceeds of an issue of preferred stock totaling $1,400,000. The company has treasury certificates, Liberty bonds and other investments to a total of about $1,400,000, this item having been increased about $500,000 during the present year. Its surplus was $1,635,536 at the close of the last fiscal year and it has been increased by $483,769 in the interval since. In additions to a liberal allotment of reserves, substantial increase in plant account and writing off of abnormal war costs in inventories. The company has outstanding $4,000,000 common stock, $2,260,200 of cumulative 7 per cent preferred stock and $2,017,800 of 6 per cent serial bonds.

Silas J. Llewellyn, president of the company, says: "The next year should be the greatest in the steel business that was ever known. The labor situation within the industry is clearing rapidly and the only danger is of a serious coal shortage. In any event the cost of fuel will be high as is everything else. I do not see, however, how we can progress toward a lower level of prices in the face of contrary conditions all over the world. There is an enormous demand for commodities of all kinds and the bidding that results from this pressure to buy makes downward revision almost out of the question. We have passed the stage of regulation and will have to work out of the situation as best we can—principally by means of increased production."

To Operate Furnace

Stanton S. Freeman, receiver for the Seaboard Steel & Manganese Corp., has been authorized by the court to operate one of the blast furnaces of this company at Temple, Pa., in the production of foundry pig iron. The furnace is to go in blast immediately and the output is expected to be 4000 to 5000 tons per month. The iron will be disposed of by the Debevoise-Anderson Co., and by Philip E. Wright.

Strike Called Off

The employes of the Globe Iron Co., Jackson, O., manufacturer of high silicon metal, who have been on a strike since July 7, have returned and the furnace has resumed. None of the demands of the men were granted. They returned under the same conditions and wage scale which prevailed when they went out.

Placing Skip Hoists

The Empire Steel & Iron Co. has placed a contract for the erection of a skip bridge at one of its blast furnaces at Catasauqua, Pa. The Thomas Iron Co. is in the market for a skip bridge to be erected at its blast furnace plant at Hokendauqua, Pa.

New Foundry Equipment Company Formed

The Foundry Equipment Export Corp., New York City, has filed articles of corporation with the federal trade commission with an authorized capitalization of $50,000. The officers follow:

T. S. Hammond, Whiting Foundry Equipment Co., Harvey, Ill., president; L. L. Munn, Arcade Mfg. Co., Freeport, Ill., first vice president; E. J. Woodison Co., Detroit, Mich., second vice president; V. E. Minnich, American Foundry Equipment Co., New York City, treasurer; S. T. Johnson, Obermayer Co., Chicago, secretary. The other directors are W. C. Norcross, American Molding Machine Co., Terre Haute, Ind.; R. S. Buch, Buch Foundry Equipment Co., York, Pa.; George L. Grimes, Grimes Molding Machine Co., Detroit.

Obituaries

JOHN F. BARKER, former president and one of the founders of the Gilbert & Barker Mfg. Co., Springfield, Mass., died at his home in that city of heart failure on Nov. 21. Mr. Barker was born in Newton Upper Falls, Mass., Dec. 16, 1839, and located in Springfield in 1862. He began work at the United States armory there in charge of the pipe department at the water shops, where he remained until the founding of the Gilbert & Barker Mfg. Co., in 1865, which was incorporated in 1870. He was treasurer and manager of the company until 1884, when he was elected president, which position he held until he retired in 1911. He was succeeded by R. H. McNall, the present incumbent. For 46 years, Mr. Barker was the dominating personality in the business of the Gilbert & Barker company. He held the affection and esteem of his associates and employes throughout his period of service.

Peter P. O'Horo, secretary and treasurer of the Excelsior Cycle Co., Michigan City, Ind., died on Nov. 24, at that city.

Frank B. Montgomery, traffic manager for the International Harvester Co., Chicago, died Nov. 24, at his home in that city. He became traffic manager of the McCormick Harvester Machine Co. in 1900, and from the formation of the International Harvester Co., in 1902 until his death he was president and general manager of the corporation's industrial railroads.

Edward E. Dwight, 68, president of the E. A. Kinsey Co. and the Tool Steel Gear & Pinion Co., Cincinnati, died on Nov. 16, at his home in Cincinnati.

John F. Koepke, aged 41, foundry superintendent of the Traylor Engineering & Mfg. Co., Allentown, Pa., died Nov. 8 at the Allentown hospital, from burns received at his work on Oct. 13.

Thomas J. Livezey, aged 38, assistant superintendent of the open hearth department of the Alan Wood Iron & Steel Co., Ivy Rock, Pa., died at the Charity hospital, Norristown, Pa., Nov. 18. He had been connected with the Alan Wood company for the past 13 years.

Meinrad Humeltenberg, superintendent of the Golden State & Miners' Iron Works, San Francisco, died Nov. 12 in a hospital in that city. He had been in the employ of the one company for the past 59 years, gradually rising from a minor position until 10 years ago he was made superintendent. He was 71 years old.

November Tool Inquiry was Keen

Machinery Sellers Chief Difficulty is in Obtaining Satisfactory Deliveries From Manufacturers—General Electric Largest Buyer in East—Truck and Tractor Builders Lead in West—Steel Companies Take Cranes

UNABATED and steady though scattered, the demand for machine tools and metalworking equipment continued throughout the month of November. This was true in Canada as well as the United States. As has been the case for many months past, the automotive and allied industries led in requests for prices and in orders closed, although car builders are fast forging to the front as important factors among prospective tool users. It is true that some contraction in buying was experienced because of steel and coal strikes, but these factors did not hamper inquiries. A slight lull was experienced in the East the first part of the month but later came a period of keen activity. This was not as large as it would have been could satisfactory deliveries have been made. This likewise was true in other districts where sellers' efforts were hampered by the fact that builders' delivery dates are set so far into the future. Manufacturers here and there are postponing their purchases of machine tools, cranes, etc., until after Jan. 1, 1920, but so much equipment is needed quickly, this is the exception rather than the rule. Some price advances were noted and some lines have price tags above wartime levels. Complaint is heard from tool builders about under-production. On the other hand, some shops which reduced their payroll some months ago have not put on any more men. Makers of heavy machinery in the Pittsburgh district complain of a scarcity in cleaning room labor.

Truck Manufacturers Taking Many Tools

TRUCK and tractor business has superseded the passenger car demand for tools in the automotive industry. The H. H. Franklin Co., Syracuse, N. Y., is to produce a 1-ton truck, has purchased some equipment and is understood to be preparing a large list. The Acme Motor Truck Co., Cadillac, Mich., purchased a few tools and the Apex Motor Co., at Ypsilanti, Mich., is in the market for truck plant equipment. Extensive buying was done by Milton A. Holmes for the Transport Truck Co., Mt. Pleasant, Mich., and the Reliance Motor Truck Co., Appleton, Wis., will buy $80,000 worth soon.

Activity among the manufacturers of tractors featured the past month's buying. Perhaps the largest purchaser was the General Motors Corp. for the Samson Tractor Division, Janesville, Wis. One order for gear cutters is said to have a value of $160,000. The Four Drive Tractor Co., Big Rapids, Mich., bought $10,000 worth of equipment; the International Harvester Co., Chicago, among other equipment, purchased four 21-inch turret lathes for its tractor plant; and the Allis-Chalmers Mfg. Co., Milwaukee, issued a list.

Passenger car manufacturers have been well equipped during the past few months but continue to take their quota. The Nash Motors Co., Milwaukee, bought $60,000 worth of tool room equipment and will start soon on purchases of production machinery. Dodge Bros., Detroit, issued a comprehensive list, as did the Chevrolet Motor Car Co., Bay City, Mich., and the Hudson and Essex companies, Detroit.

Miscellaneous Demand Keeps Up at Splendid Rate

WIDESPREAD demands for tank cars is given as one of the reasons for the suddenly increased number of inquiries from carbuilders. These lead the requests from miscellaneous manufacturers. The Haskell & Barker Car Co., Michigan City, Ind., issued a sizable inquiry; the American Car & Foundry Co., bought 10 or 12 fabricating tools; the Atlas Car & Mfg. Co., Cleveland, inquired for some equipment and the Magor Car Corp., Passaic, N. J., issued a sizable list. The Greenville Steel Car Co., Greenville, Pa., is to buy equipment for a machine shop. The largest inquiry, numerically, however, came from the General Electric Co., Schenectady, N. Y. It aggregated about 200 tools, over half of which are said to have been purchased. Other large inquiries for equipment were the Akron, O., tire manufacturers. The Goodyear Tire & Rubber Co. revived its inquiry; the Firestone Tire & Rubber Co., issued a list of 36 machines, bought some equipment and postponed closing on the remainder until after Jan. 1. The B. F. Goodrich Co., also is looking for machinery. The Otis Elevator Co., bought equipment for Quincy, Ill., as did the Standard Oil Co., for Bayway, N. J., and Toledo, O. The Perfection Heater Co., Cleveland, issued a list of about 20 machines and a smaller list came out from the Lewis Steel Products Co., Toledo.

Transportation Companies Are Stirring

SOME stir is noted among the railroads. In some quarters this is not expected to develop much for machine tool sellers, since no real buying is anticipated before the return to private ownership and this now seems to be deferred. The Pennsylvania bought cranes for Crestline, O., and Logansport, Ind. The Chicago, Burlington & Quincy railroad, Chicago, revived its list of 50 tools. The Santa Fe and Rock Island railroads, that city, each made some small purchases. The New York Central issued some tentative inquiries in Cleveland and in the east the Western Maryland railroad entered the market for several machines for a repair shop.

Purchases by shipbuilders are more prospective than actual. The Union Shipbuilding Co., Baltimore, is to spend $4,000,000 on new facilities, and the National Concrete Boat Co., Norfolk, Va., is to build a $500,000 yard. The Submarine Boat Co. will buy extensively if it lands a shipbuilding contract. The Robert Dollar Steamship Co., New York, purchased 700 feet frontage on Long Island, N. Y., for a pier.

With Few Exceptions Crane Sales Are One Each

DESPITE the fact that the iron and steel industry recently went through the throes of a general strike, most of the crane business of the past month has come from that branch of manufacturing. With the strike practically ended, some sizable awards are expected soon. The Midvale Steel & Ordnance Co., closed on nine cranes for Johnstown, Pa., however, and the Superior Sheet Steel Co., Canton, O., bought five. The Slick-Knox Co., Pittsburgh, asked for three for Wheatland and the Firestone Steel Products Co., Akron, O., revised its recent inquiry to read six overhead and two hand-operated cranes. The largest inquiry current at present is said to be the one from the Bethlehem Steel Co., calling for 11 cranes for Lebanon, Pa. The Follansbee Bros. Co., Pittsburgh, is taking bids on seven cranes for its new plant at Toronto, O., and the National Tube Co., Pittsburgh, is expected to issue a considerable list soon for its new plant at Gary, Ind. In addition to the seven hammers wanted by the Pittsburgh Knife & Forge Co., Coraopolis, Pa., this company wants some crane equipment. The Concrete Steel Co., New York City, the Newton Machine Tool Works, Inc., Philadelphia, and the Aluminum Co. of America, Marysville, Tenn., each bought two cranes and the Blaw-Knox Steel Co., Hoboken, Pa., took three. Several companies bought or inquired for one crane each.

Tool Purchases Held Until 1920

Users Disinclined to Increase Equipment Stocks During Inventory Time—Pennsylvania Buys for Stark, O., Shops—Brown Hoisting Machinery Books Cranes for Chile — Foote-Burt Wants 17 Cranes

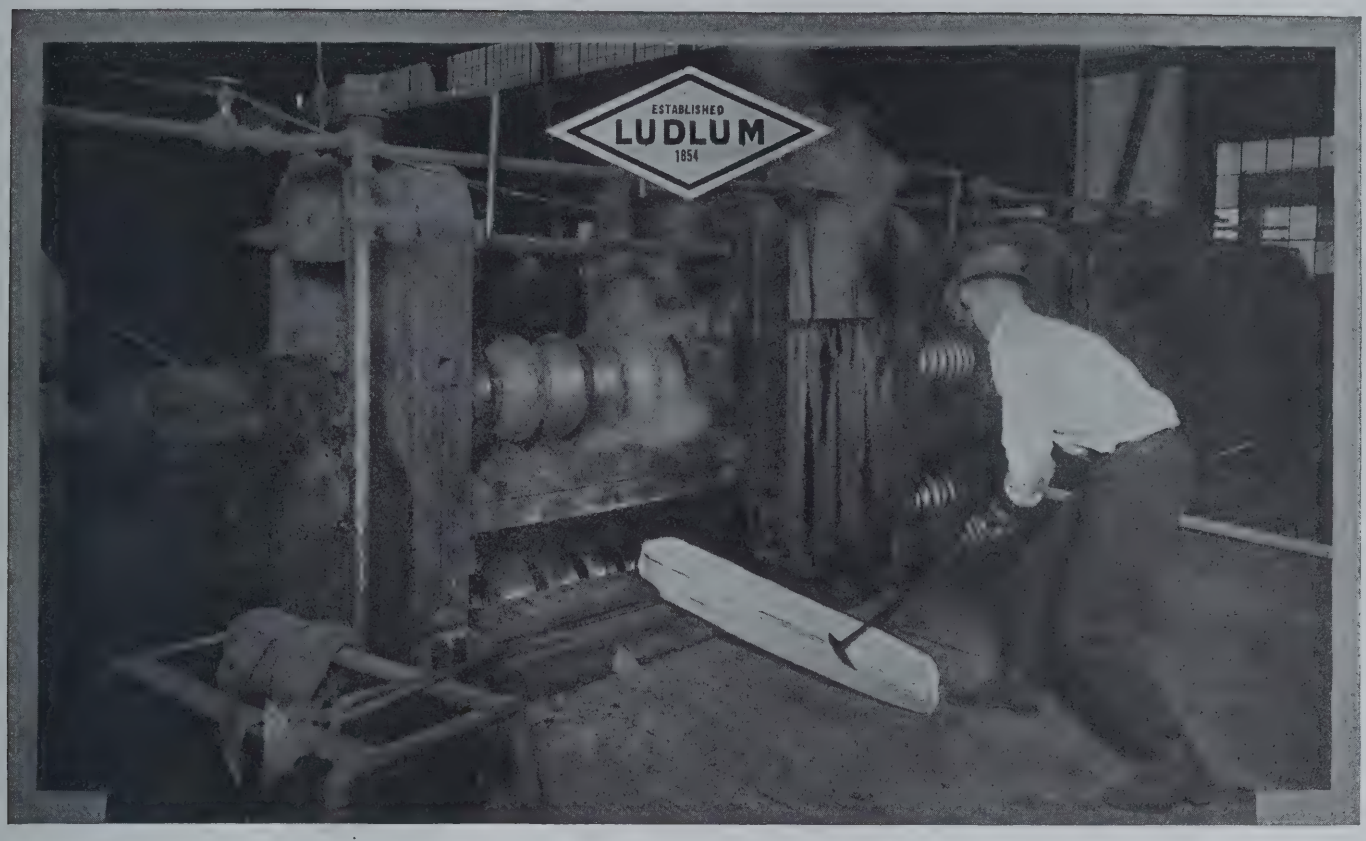
DISINCLINATION on the part of users to add to stocks of equipment at inventory time is holding up sales in various districts. While for the most part November was a satisfactory selling month, particularly in Chicago, some Cleveland dealers find their total sales far below October. No improvement is expected before the middle of January.

Buying of machine tools by brass manufacturers is featured in the eastern market report, the American Bronze Co., Philadelphia, and the Oxweld Acetylene Co., Jersey City, N. J., being mentioned among purchasers. The Pennsylvania is the only railroad reported to be buying. Tools for Stark, O., shops went to eastern builders. The Sun Shipbuilding Co., Chester, Pa., closed on about a dozen tools and the Worthington Pump & Machinery Corp., New York, issued a sizable list, to apply on its 1920 budget.

While there is a lull in buying in Chicago, this is not a slump, since there is an active demand for machinery. Forge shop equipment is being purchased for the tractor plant of the Allis-Chalmers Mfg. Co., Milwaukee. Because of coal strike, some users in the Chicago district are installing oil-burning equipment.

Issuance of a list of 17 cranes by the Foote-Burt Machine Co., Cleveland, is thought to be the forerunner of its machine tool list for its new plant. Machine tool activity is at a low ebb in the Cleveland territory because so many users are holding back orders until after the new year. Inquiries are fairly frequent and presage much business for January. Keen interest is manifest in the latest list issued by the government, comprising 2500 tools, inventoried at $4,000,000. It is claimed that users can buy direct at prices far below prevailing markets. Stocks at the government warehouse of the Symington-Chicago Corp., Chicago, soon will be available for users there. Buying has been slow since prospective purchasers have been held up in favor of Belgium. One list was increased from 84 to 340 tools.

Motor equipment for the Toronto, O., plant of the Follansbee Bros. Co., Pittsburgh, went to the Allis-Chalmers Mfg. Co. and the Westinghouse Electric & Mfg. Co. Cranes have not been awarded as yet. Three hoists were purchased by the Koppel Industrial Car & Equipment Co., Koppel, Pa. The McConway & Torley Co., Pittsburgh, closed on a 7½-ton crane and a crane bridge.



While the lull in overhead cranes continues, some activity is reported in the locomotive crane market. One of the largest export orders placed in recent months went to the Brown Hoisting Machinery Co., Cleveland, for six 15-ton cranes for shipment to Chile. Westinghouse, Church, Kerr & Co., New York, are to close one overhead and a small electric crane for the fertilizer plant of Armour & Co., Chrome, N. J., having already purchased a locomotive crane. These engineers also will buy crane equipment for Armour's fertilizer plant at Baltimore. Prospective crane purchasers include Hudson Iron & Metal Co., Bayonne, N. J.; Stone & Webster, Boston, for Jeannette, Pa.; Bessemer Limestone Co., Bessemer, Pa.; Van Dorn Iron Works and the Superior Foundry, Cleveland; the Du Pont Engineering Co., New York, and the Upson Co., Lockport, N. Y. The Anaconda Copper Co., New York, is to buy a special overhead crane and bids will close Dec. 23 on four special gantry cranes for the New York state barge canal terminals in New York City.

Brass Makers Buy Tools; Chile Awards Cranes

BRASS manufacturers are figuring actively in the eastern machine tool market. The American Bronze Co., Philadelphia, the Oxweld Actylene Co., Jersey City, and a number of other such interests have been recent buyers, closing in the aggregate on a sizable amount of equipment. This activity, however, was featured by no large individual orders, and, in fact, few if any large contracts recently were noted in any quarter. Possibly one exception may be made in the instance of the Pennsylvania lines west, which has bought a number of miscellaneous tools for its shops at Stark, O., a substantial portion of which went to eastern builders. Inquiries for this equipment have been coming out over a number of weeks. The Sun Shipbuilding Co., Chester, Pa., has also been a buyer, closing on a fair list, including a shaper, slotter and a half dozen or so other machines. The Worthington Pump & Machinery Corp., 115 Broadway, New York City, is asking for figures on about $120,000 worth of machine tool equipment for its 1920 budget. The company also is considering one overhead crane in this budget.

Outstanding among developments in the locomotive crane market is the award of six 15-ton cranes to the Brown Hoisting Machinery Co., Cleveland, for shipment to Chile. This is one of the few sizable export orders to be placed this year and therefore is especially notable. That more export business has not developed has been a source of disappointment to locomotive crane builders, for foreign requirements are believed to be heavy, but until there is an improvement in the foreign exchange rate situation no large buying is expected.

Other business in the locomotive crane market includes a 25-ton Ohio crane for the fertilizer plant of Armour & Co.,

High Speed Steel

If you are a manufacturer of high speed steel drills, milling cutters, reamers, etc., you will appreciate the care which is observed in the manufacture of LUDLUM HIGH SPEED STEEL.

Here is shown a close up view of our 18-inch rolling mills. This cogged billet has already been passed thru several times, but it still has to go thru several smaller rolls before it is of the proper dimensions for your particular use. Besides, it will have to be inspected and tested several times, then annealed and inspected again before it is finally shipped to you.

These many operations are what makes Ludlum Steel CONSISTENTLY UNIFORM.

Prompt shipments from warehouse stock at Watervliet, N.Y.; Detroit, Mich.; Chicago, Ill.; or Cambridge, Mass., handled through our Branch Offices.

LUDLUM STEEL COMPANY

General Offices and Works:

WATERVLIET, N. Y.

Branch Offices:

Chicago Cambridge, Mass. Detroit Buffalo New York City
Cincinnati Cleveland Philadelphia Pittsburgh

at Chrome, N. J. The business was placed through Westinghouse, Church, Kerr & Co., 37 Wall street, New York City. For Armour's Baltimore fertilizer plant, this company wants one each 5 and 10-ton bucket-handling cranes. These interests are also to buy one overhead electric crane, with 100-foot span, to operate a 3-yard clam shell bucket, and a 5-ton electric crane, with 60-foot span, for the Chrome plant. The Hudson Iron & Metal Co., Bayonne, N. J., is inquiring for a used 10-ton locomotive crane. Stone & Webster, Boston, contracting engineers, are in the market for a 20-ton locomotive crane for Jeannette, Pa. Of interest to locomotive crane builders is a large cement plant to be erected near Bessemer, Pa., by the Bessemer Limestone Co. The plant is to have a capacity of 3000 barrls daily. The Atlantic Refining Co., Philadelphia, is inquiring for a 50-ton shear-legged derrick. Revised inquiry from the Sun Shipbuilding Co., Chester, Pa., calls for one 15-ton crane with 76-foot span and two 15 or 20-ton cranes with 112-foot span.

The lull in overhead crane buying continues. The Du Pont Engineering Co. has recently bought a 5-ton overhead crane, and the Upson Co., Lockport, N. Y., has purchased a 3-ton electric crane, with 38-foot span, from the Shepard Electric Crane & Hoist Co., Montour Falls, N. Y. Few other awards have been reported. The Anaconda Copper Co., New York City, is receiving preliminary figures on a special overhead crane, of about 70 tons capacity. There is, however, little likelihood of this business developing in the near future. Bids will be closed Dec. 23 on four special gantry cranes for the New York state barge canal terminals in New York City.

Inventory Time Holds Up Tool Inquiries

SOMETHING of a lull in activity of demand for machine tool equipment is noted by some dealers in the Chicago district, probably due to the approach of inventory time. This does not mean that the market has slumped, but there simply is a little slowing down of active inquiry for the small lots and single tools that have been extremely noticeable for some time.

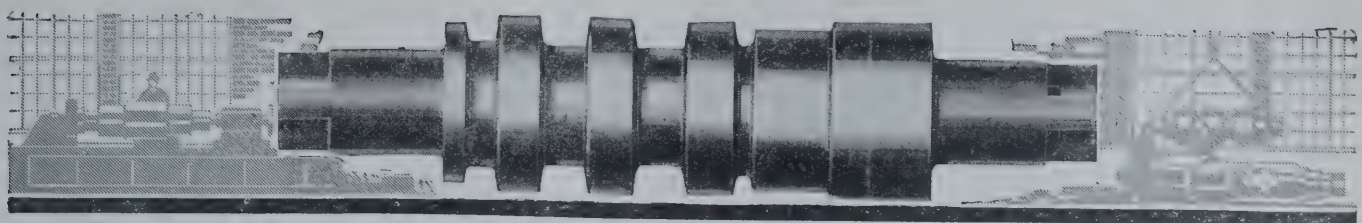
November promises to be one of the best months of the year in total sales. Many dealers find they have much more equipment on back orders with manufacturers now than at any time recently, deliveries being extended until now comparatively little business can be placed for delivery this side of February and much is even more deferred.

Government selling from the warehouse at the plant of the Symington-Chicago Corp. is slow, at present being held up in favor of shipments to Belgium. A list of 84 was being figured from that collection of tools and this has been increased to 340 by a recent change. Assurances are being given to local dealers that arrangements are being made to move this equipment without red tape and that it will be available for domestic buyers shortly. This will assist greatly in the case of many prospective buyers who cannot obtain their needs from manufacturers without a long wait. The new tractor plant of the Allis-Chalmers Mfg. Co., Milwaukee, is being equipped and is already on a production basis. Some drop forge equipment now is being figured. As a result of the present coal shortage some users are installing oil burning equipment.

Follansbee Cranes Not Yet Awarded

CONTRACTS for the equipment for the new sheet mill at Toronto, O., of the Follansbee Bros. Co., Pittsburgh, steadily are being closed, although it is stated at the company's offices that the cranes for the plant have not as yet been let. Eastern advices had it that the Alliance Machine Co., Alliance, O., had been awarded the heavy duty cranes and that the Pawling & Harnischfeger Co., Milwaukee, was the successful bidder for the lighter cranes. The fact that the present plant of the company is equipped with these makes of cranes no doubt explains the report. The Allis-Chalmers Mfg. Co., West Allis, Wis., has been awarded the sheet mill motors for this plant, which are of liquid control type, while the reversing set has been placed with the Westinghouse Electric & Mfg. Co., East Pittsburgh, Pa.

Hubbard & Co. has placed a 10-ton, 46-foot span crane for its new Chicago plant with the Milwaukee Electric Crane Co., Milwaukee, and this company also has been awarded three 4-ton monorail hoists by the Koppel Industrial Car & Equipment Co., Koppel, Pa. The McConway & Torley Co., Pittsburgh, has ordered a 7½-ton Shaw crane through the Pittsburgh office of Manning, Maxwell & Moore, Inc., and has awarded a crane bridge to the Pawling & Harnischfeger Co. Inquiries continue to pour out for cranes and other heavy lines, but for some reason, possibly the coal strike, actual orders are few. Not much activity lately has been noted in machine tools.



Sales and Inquiries Drop Off in Cleveland

COMPILATION of business transacted during the past month by Cleveland machinery dealers, show considerable of a reduction as compared with October. One dealer states his sales for November were approximately half of what they were the preceding month. In some quarters this was not unexpected, since it is a common thing among users of equipment to postpone purchases at the end of the year. Other users, however, who require equipment quickly, have placed their orders for the best possible delivery which will not be until well along in 1920. Some are postponing awards because they are taking or are about to take inventory but these are not so numerous as formerly because of the increasing practice to maintain perpetual inventories. Both sales and inquiries, however, are at a low ebb.

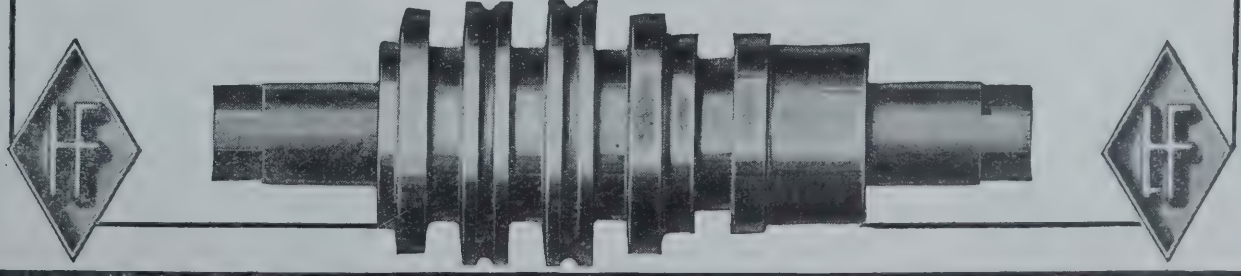
One of the biggest lists to come out in recent weeks is issued by the Foote-Burt Machine Co., Cleveland, which is erecting a new plant. Negotiations are being conducted for the plant's crane equipment and prices are being asked on 17 electric cranes. These mostly are for small capacities, 1, 2 and 3-ton with two or three 10-ton machines included. No formal list of machine tool equipment has come out, although it is known that the company is lining up its requirements along this line and has made a few decisions. The Superior Foundry Co., Cleveland, still is in the market for a small crane, and the Van Dorn Iron Works, that city, likewise requires crane equipment.

Recent purchasers in the Cleveland market include the Adams Axle Co., Findlay, O., which purchased a centering machine, and the Adams-Bagnall Electric Co., Cleveland. The former company announces its intention to replace with new tools later when better deliveries are possible, the equipment it has purchased since the armistice which does not meet its exact requirements. Another purchaser in Cleveland recently is the Hydraulic Steel Co., that city, which closed on some hammer equipment. It now is taking quotations on 2500 and 3000-pound single frame steam hammers. Hammer equipment likewise is required by the Truscon Steel Co., Youngstown, O., which is taking quotations on No. 4 and No. 5 Nazel power hammers. The Lakeside Forge Co., Erie, Pa., recently closed on 12 hammers for its shop.

Among the smaller inquiries current in Cleveland is one from the Cleveland Metal Products Co., that city,

Say, Fella's—

I find there aint sich a H— of a difference between men an' metal after all. The less there is in 'em, the more kick an' fuss they kin make, an' the better they are the easier to git along with. Take those HUBBARD ROLLS—good all the way through. Ya never hear a squeak or squawk out of 'em.



So Long,

Rolling Mill Jim.—

Hubbard Steel Foundry Co.

EAST CHICAGO, IND.

All Kinds of Iron and Steel Rolls and Steel Castings.

and one from the Holt Mfg. Co., Peoria, Ill. The latter calls for one vertical Gould & Eberhardt gear cutter, 36 to 48-inch capacity. A San Francisco dealer, namely the H. F. Lyon Co., is endeavoring to satisfy a customer's requirements in Cleveland. The list calls for one large planer, 48 x 48-inch, one 24-inch shaper, one 24-inch or larger keyseating machine, one 24-inch x 12-foot and one 26-inch x 18-foot lathe. Another California concern soon to be in the market for equipment is the Pacific Iron & Steel Co., Inc., Los Angeles. Its list comprises a large boring mill, several large sized lathes and a few small punches in addition to foundry equipment. This company is to equip a foundry and machine shop as additions to its steel plant.

While the auction sale of approximately 700 government-owned machine tools as well as other equipment at the Eddystone rifle plant, Eddystone, Pa., scheduled for Dec. 4 and 5, arouses but little interest on the part of Cleveland sellers, considerable attention is being paid to the issuance of the latest government-owned equipment list by the war department. As outlined elsewhere in this issue, this list comprises 2500 machine tools with an inventory value of approximately $4,000,000. Interest is manifested in this equipment, mainly for the reason that sales direct to users are militating against the efforts of dealers. Some cases are known where sales at prices far below the market for new tools, have been consummated direct with users, who previously had been endeavoring to supply their wants through dealers. Other prospective purchasers have told the dealers they have an opportunity to buy government-owned equipment but want their quotations, apparently for their comparative value only. Several have said that if unsuccessful in obtaining government-owned machines, they would then be in the market for the equipment in their inquiries.

Contingent upon the successful outcome of some financial arrangements now being planned, some large users are expected to come into the market. The Shelby Tractor & Truck Co., Shelby, O., will buy more equipment, it is understood, when it has sold additional stock. The Timken-Detroit Axle Co., Canton, O., and Detroit, has increased its capital from $4,550,000 to $45,000,000 and some of the proceeds are to be used for additional equipment and buildings, including a machine shop at Canton. If the government purchases the Dayton-Wright airplane plant, at Dayton, O., the General Motors Corp. will take over the McCook field and erect a plant for the manufacture of an air-cooled motor automobile. Two 4-story buildings for the H. C. S. Motor Car Co., Indianapolis, will require considerable equipment. Woodworking machinery probably will be purchased by the Rubay Co., Cleveland, which contemplates a 1-story addition, 100 x 200 feet.

The Union Steam Pump Co., Battle Creek, Mich., is to spend $20,000 on machine shop additions and equipment. The Humphrey Co., Kalamazoo, Mich., will probably make sizable purchases of machinery for a 3-story plant in which it will manufacture water heaters. The Standard Register Co., Dayton, O., will doubtless add to its equipment after its new addition is completed. A machine shop and office building costing $125,000 for the Seibold, Mien Co., Dayton, O., will mean some machinery orders soon. Presses, etc., will be purchased by the Lima Sheet Metal Products Co., Lima, O., early in the spring. Others who are expanding include the Union Motor Co., Bay City, Mich.; the American Gear & Mfg. Co., Jackson, Mich.; The Goodyear Tire & Rubber Co., Akron, O.; the Ames Bonner Co., Toledo, O., and the Franz Foundry & Machine Co., Akron, O.

Canadian Sellers Report Splendid Demand

KEEN demand for machinery and machine tools continues in Canada. The delivery of tools, however, is an adverse factor in trading, and on this account the demand for used and rebuilt equipment is increasing. General machine shop equipment is in demand and the requirements of automobile plants, etc., are almost impossible to fill without considerable delay. Gillies Bros. who are having a sawmill erected at Braeside, Ont., will install electrically-operated machinery and equipment. Soren Bros., Toronto, shortly will be in the market for equipment for a tinware manufacturing plant. Ernst Bros. Co., Mount Forest, Ont., is in the market for one punch and shears, a milling machine and an 8-foot engine lathe. Rahm & Watt, Pelee Island, Ont., are in the market for machinery for mixing cement for the manufacture of cement tile. Appleon & Chipman, engineers, room 11, 68 Wellington street, east, Toronto, are asking for catalogs, prices and information on milling stones, corn-oil machinery, including hydraulic presses, feed dryers, copper converters, vacuum pans, filter presses, attrition mills and spiral conveyors, etc.

Construction and Equipment

Concise and Timely Business Building Opportunities from the Field of Industry

Among New England Plants

AUGUSTA, ME.—The Dirigo Equipment Co. has been incorporated to make window metal weather strips and screens with $10,000 capital, by A. F. Parrott, B. S. Viles and E. M. Thompson.

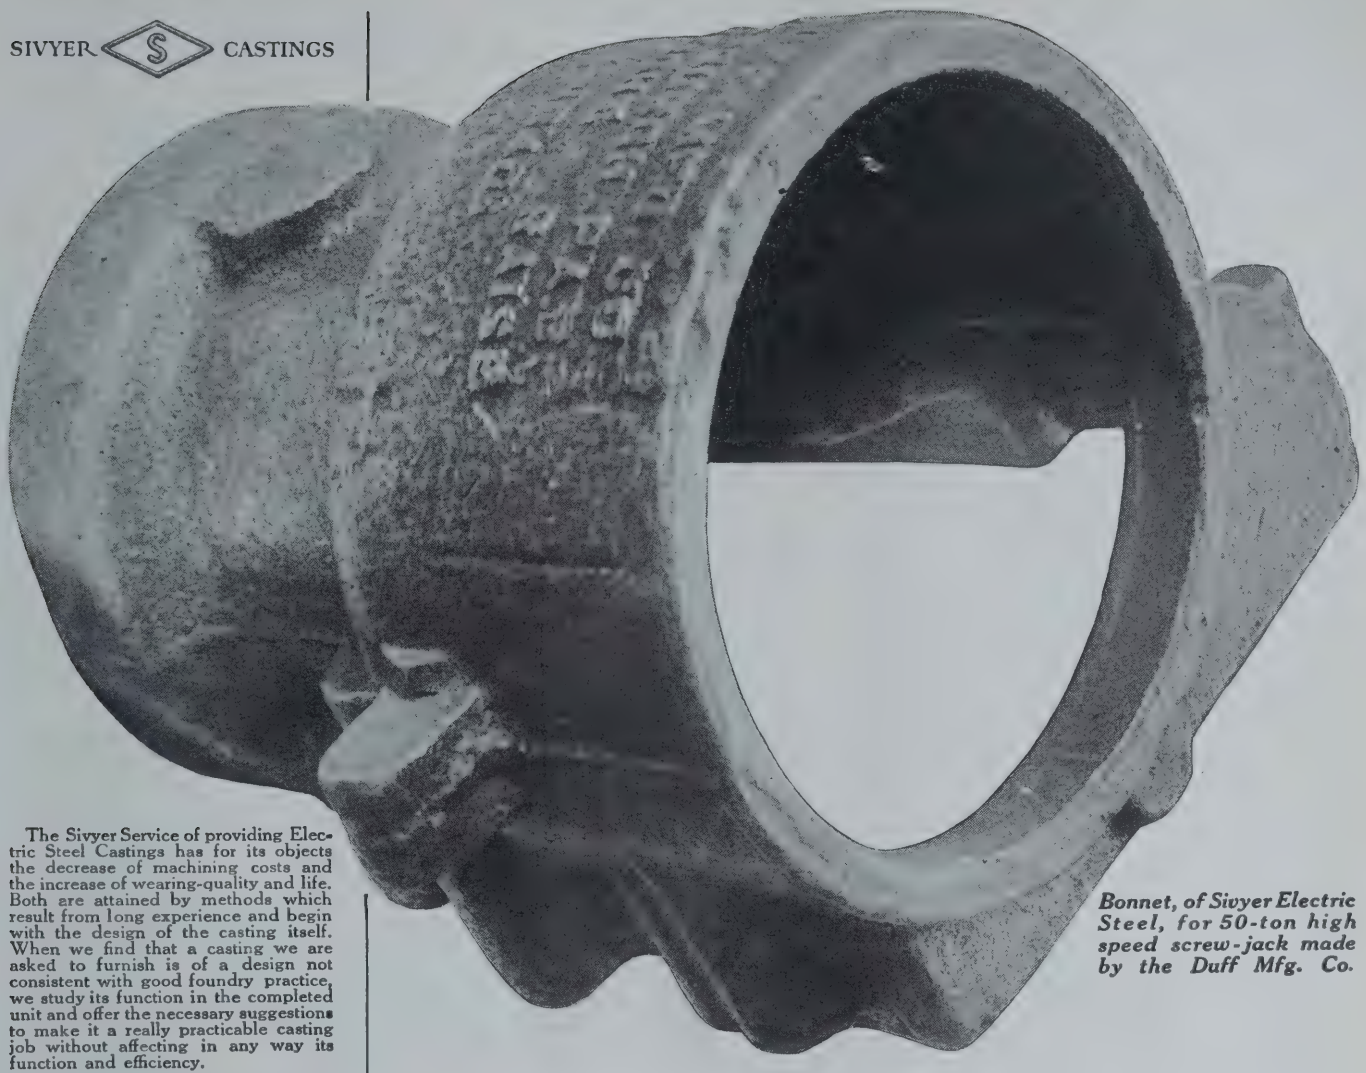
KENNEBEC, ME.—The Waterville Mfg. Co. has been incorporated with $100,000 capital to manufacture and deal in machinery.

WATERVILLE, ME.—The Waterville Mfg. Co. recently was incorporated to build machinery and make tools and implements with $100,000 capital, by G. W. Wiseman, N. H. Burrows and Carroll N. Perkins.

BOSTON.—The Boston Merchant Marine Sealing Co. has been incorporated to repair vessels, ships and boats, with $25,000 capital, by John J. Collins, Ralph C. Christensen and S. J. Christensen.

BROCKTON, MASS.—The H. F. Crawford Mfg. Co. recently was incorporated with $25,000 capital to manufacture machinery.

CAMBRIDGE, MASS.—The Houde Co. recently was incorporated to make shock absorbers, etc., with $10,000 capital, by James N. Scully, Francis P. Scully and W. J. Goggin.



CAMBRIDGE, MASS.—The Eco Mfg. Co. contemplates a manufacturing building, 50 x 110 feet.

HOLYOKE, MASS.—The Cowan Truck Co. plans a plant addition, 2-stories, 100 x 200 feet.

SPRINGFIELD, MASS.—The Vitrified Wheel Co. contemplates a 2-story, 40 x 80-foot addition.

PAWTUCKET, R. I.—The W. H. Haskell Mfg. Co.,

SIVYER CASTINGS

Bonnet, of Sivyer Electric Steel, for 50-ton high speed screw-jack made by the Duff Mfg. Co.

The Sivyer Service of providing Electric Steel Castings has for its objects the decrease of machining costs and the increase of wearing-quality and life. Both are attained by methods which result from long experience and begin with the design of the casting itself. When we find that a casting we are asked to furnish is of a design not consistent with good foundry practice, we study its function in the completed unit and offer the necessary suggestions to make it a really practicable casting job without affecting in any way its function and efficiency.

Secondly: Sivyer Service analyzes the functions of the casting and specifies the proper composition steel for the job; long experience with carbon and alloy steels has enabled us to reduce costs and increase quality remarkably for many different industries.

Thirdly: Sivyer Service makes a careful study of the pattern and molding problems involved, for improper gating and insufficient risers are often the greatest wasters of machining labor and metal.

Fourthly: Sivyer Service analyzes carefully the proper annealing methods to be used and controls their proper application through unfailingly efficient equipment and men. In short, the Sivyer Service supervises every step necessary to secure unusually and unfailingly good castings of electric steel. It never relies on one factor alone, relies very little even on the natural freedom of electric steel from occluded gases and on its commonly recognized merit in resisting crystallization. It also depends but little on the inherent scientific accuracy of the electric furnace process. From casting-design to sand-blasting and tumbling, the fundamental superiority of Sivyer Steel is due to its men and metal. Their value is best proved by the fact that, although the production of steel castings is generally looked upon as a local one, the Sivyer market is national.

WHERE the design is such that ordinary castings tend to develop cracks and strains in cooling, the Sivyer method of gating and heading assures castings of unquestioned strength. Lifting-jacks used under heavy railway cars and locomotives must be made of metal known to be dependable, for a failure might mean costly damage, and endanger the lives of the workmen. Also the jacks must be reasonably light to facilitate handling. The toughness of Sivyer Electric Steel, combined with the Sivyer system of gating and heading, produces a light and strong casting that will function unfailingly in the most severe service. The widespread recognition of Sivyer methods and metal has won for Sivyer Castings their national market.

SIVYER STEEL

SIVYER STEEL CASTING COMPANY, MILWAUKEE

24 Commerce street, plans a machine shop addition, 2-stories, 85 x 150 feet, to cost $75,000.

BRIDGEPORT, CONN.—The Bridgeport Worm & Gear Mfg. Co. recently was incorporated with $100,000 capital.

BRIDGEPORT, CONN.—The Bridgeport Hardware Mfg. Co. is expected to start work soon on a plant, 2-stories, 40 x 125 feet, to cost $35,000.

HARTFORD, CONN.—The Royal Typewriter Co. has let a contract for a 5-story, 55 x 308-foot addition.

PROVIDENCE, R. I.—The Master Tool Co. recently was incorporated with $25,000 capital.

SOUTHINGTON, CONN.—The Bristol Brass Co., Bristol, Conn., is reported to be considering property as a site on which to build a plant.

WESTPORT, CONN.—The American Safety Device Co. has been incorporated with $100,000 capital.

North Atlantic States

BROOKLYN, N. Y.—J. G. Kessler & Bros., smelting and refining zinc, has been incorporated with $10,000 capital, by G. J. Goldberg, J. G. and M. Kessler, 649 Manhattan avenue.

BUFFALO.—The Lover Top & Converter Co. is having plans prepared for an addition. Edward Lover is president.

BUFFALO.—Swan & Finch, New York, have bought the property of the Cadillac Refining Co. and will make improvements.

BUFFALO.—The Erie County Traction Corp. has been incorporated with $450,000 capital, by R. B. Austin, E. L. Frost and J. L. Cummings.

BUFFALO.—The Miles Electric Car Lock Corp. recently was incorporated with $500,000 capital, by G. G. Canute, S. Johnston and J. R. Kingsley.

ELMIRA, N. Y.—The Elmira Foundry Co. is reported planning a foundry, 80 x 80 feet, to cost $10,000.

ENDICOTT CITY, N. Y.—The Endicott Johnson Co. contemplates a power house.

JAMESTOWN, N. Y.—The Jamestown Metal Desk Co. has been incorporated with $300,000 capital, by W. R. Reynolds, J. H. Dasher and E. E. Wellman.

LOCKPORT, N. Y.—The Harrison Radiator Corp. let a contract for an addition, 100 x 300 feet.

MIDDLETOWN, N. Y.—The Reinhalter Corp., machine shop, has been incorporated with $50,000 capital, by R. Reinhalter, W. D. Maguire and D. E. Stuart.

NEW YORK.—The Firestone Tire & Rubber Co., according to advices received here, will build a $5,000,000 plant at Hamilton, Canada.

NEW YORK.—The Proctor Automatic Projector Co. has been incorporated with $200,000 capital, by N. Ruttenberg and M. Frank, 165 Broadway.

NEW YORK.—The Economy Hoist & Body Co., Inc., recently was incorporated with $50,000 capital, by L. N. Miller, G. Mayer, 32 Broadway, and others.

NEW YORK.—The Sterling Car Body Corp. recently was incorporated with $50,000 capital, by J. J. Flannery, L. S. Dumensnil and J. J. Meehan, 140 Broadway.

NEW YORK.—The United Metal Spinning Co., 103-105 Mott street, has had plans drawn for a loft building, 5-stories, 50 x 100 feet, to cost $16,000.

NEW YORK.—The Economy Hoist & Body Co. recently was incorporated with $50,000 capital, by L. H. Miller, B. L. Erlman and A. G. Mayer, 32 Broadway.

NEW YORK.—Arthur B. Hennech, Ltd., machines, implements, etc., has been incorporated with $20,000 capital, by A. B. Hennech, I. Neuwirth, 179 Marcey avenue, and others.

NEW YORK.—The Hemco Electric Mfg. Co. recently was incorporated with $100,000 capital, by A. M. Bergenthal, G. Price and W. S. Allen, 55 East Fifty-fifth street.

NEW YORK.—The Empire Tube & Steel Corp. has been incorporated to manufacture cast iron and steel pipe castings, forgings, etc., recently was incorporated with $450,000 capital, by H. V. Craford, G. C. Sprague and A. H. Warren, 120 Broadway.

NEW YORK.—The Rollston Co., auto bodies, has been incorporated with $16,000 capital, by H. Lonschein, S. Plotkin and B. Davis, 1156 East Twelfth street, Brooklyn, N. Y.

NEW YORK.—The Standard Ship Repair Co. has been incorporated with $50,000 capital, by S. M. Louis, T. M. Constable and F. J. Nolan, 216 President street, Brooklyn, N. Y.

NEW YORK.—The A. P. Miller Supply Co., refrigerating machinery, recently was incorporated with $25,000 capital, by E. R. and G. A. J. Mager and A. P. Miller, 137 East Thirty-fifth street.

NIAGARA FALLS, N. Y.—The Carborundum Co contemplates an extension.

NYACK, N. Y.—The Ofeldt Gas Fired Boiler Co. recently was incorporated with $100,000 capital, by M. V. Bryant, E. G. and F. A. Ofeldt.

ROCHESTER, N. Y.—Josiah Anstice Co. is having plans drawn for a machine shop, 1-story, 200 x 200 feet, to cost $125,000.

ROCHESTER, N. Y.—The National Fire Escape Corp. has been incorporated with $250,000 capital to manufacture fire escapes, elevators, etc., by W. E. Turner, J. G. Ideman and W. G. Bell.

SCHENECTADY, N. Y.—The General Electric Co. has announced it will double the capacity of its plant at Windsor, Conn., by a building of 40,000 square feet.

SYRACUSE, N. Y.—The Smith Wheel Co., Inc., has had plans drawn for a plant addition, 29 x 92 x 109 feet, to cost $35,000.

SYRACUSE, N. Y.—For the purpose of manufacturing automatic melting machinery, the Nu-Way Milker Co., Inc., has been organized with a capital of $100,000.

TONAWANDA, N. Y.—The King Electric Mfg. Co. recently was incorporated with $25,000 capital, by L. Smith, B. Kibler and V. F. King.

WATERVLIET, N. Y.—The Troy Iron Works contemplates a foundry, 108 x 200 feet, to cost $35,000.

BESSEMER, PA.—A 3000-barrel-a-day cement plant will be erected near here by the Bessemer Limestone Co.

BRIDGEPORT, PA.—The Diamond State Fibre Co. plans a factory and machine shop, 1-story, 60 x 520 feet, at an estimated cost of $75,000.

CONNELLSVILLE, PA.—The Yough Electric Co. is having plans prepared for a plant.

ELLWOOD CITY, PA.—Thomas Dugan, D. E. Frew and Harry E. Fisher have bought a site here on which they plan a manufacturing plant.

ERIE, PA.—The Erie Tool Works has bought the plant of the Brown Folding Machine Co., and will remodel it.

ERIE, PA.—The Erie Motor Truck Mfg. Co., 205 Commerce building, plans a plant, 1-story, 60 x 250 feet, to cost $125,000.

MERCER, PA.—The Reznor Mfg. Co. contemplates an addition to its stove factory.

PHILADELPHIA.—The Perseverance Foundry Co. has let a contract for a foundry.

PHILADELPHIA.—The General Carbonite Co. will build a 2-story factory, 100 x 219 feet.

PHILADELPHIA.—A power house will be built at a cost of $60,000 at the Frankfort arsenal.

PHILADELPHIA.—Contracts have been awarded by M. Boyle for a 1-story machine shop addition, 29 x 30 feet.

PHILADELPHIA.—The Keystone Wagon Works, 1949 West Second street, plans a plant, 3-stories, 75 x 100 feet.

PHILADELPHIA.—Hurley Bros. have the contract to erect a wagon factory building addition, 54 x 61 feet, for Adam Frederick, to cost $10,000.

PHILADELPHIA.—The Philadelphia Textile Machine Co. has awarded the general contract for an addition. The building will be 1-story, 20 x 80 feet.

PHILADELPHIA.—Plans are being prepared for a factory and office building for the Wicaco Screw & Machine Works, to be one and two-stories, 82 x 206 feet.

PHILADELPHIA.—The general contract for a $500,000 warehouse for the Edward G. Budd Mfg. Co. has been awarded. The building will be 4-stories, 100 x 300 feet. In addition, there will be a 1-story steel storage house.

PHILADELPHIA.—Alterations and additions, costing $50,000, will be made at the plant here of the Tabor Mfg. Co., Wissinoming. A 1-story addition will be erected to the office building and a 1-story factory building, 89 x 100 feet, will be constructed.

PITTSBURGH.—The Allegheny Gear Works contemplates a plant addition, 1-story, 80 x 135 feet, to cost $50,000.

READING, PA.—The Gray Iron Foundry Co. will erect an addition, 60 x 92 feet, estimated to cost $22,000.

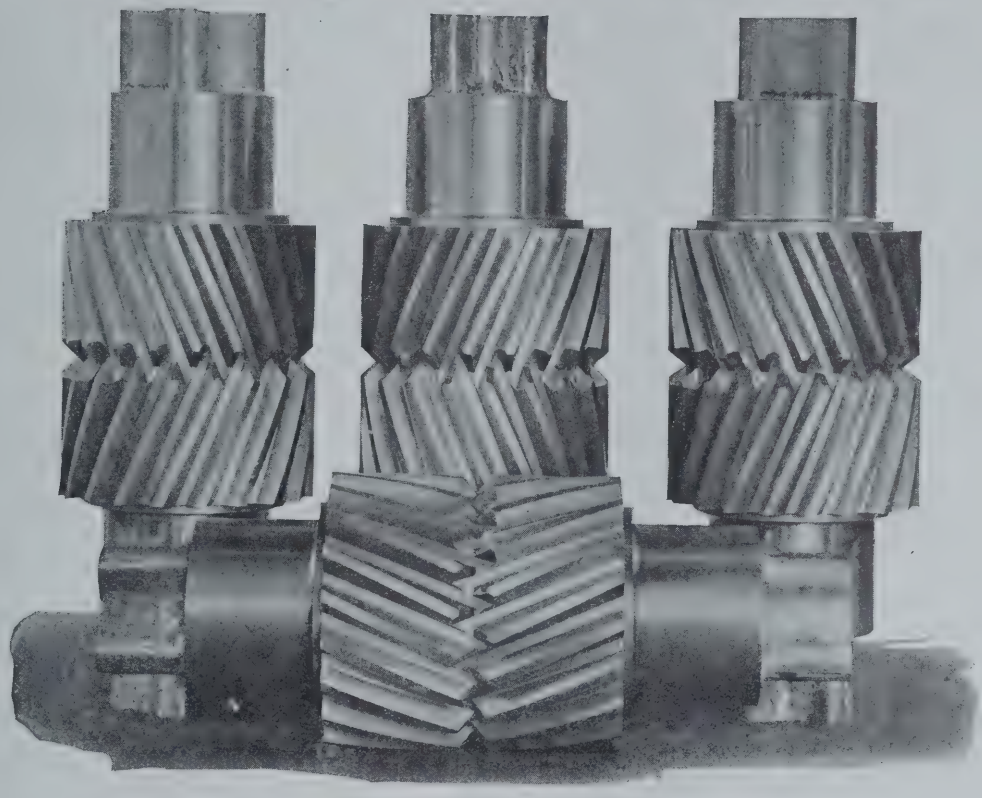
Central States Activity

BARABOO, WIS.—Moeller Bros. plan a blacksmith and wheelwright shop, 3-stories, 30 x 60 feet, at an estimated cost of $20,000.

BELOIT, WIS.—The Dowd Knife Works, manufacturing cutlery, has awarded contracts for a 1-story shop addition, 60 x 100 feet.

BRUCE, WIS.—A bond issue of $12,000 has been approved for constructing a municipal lighting system.

CAMPBELLSPORT, WIS.—A special election has been called on Dec. 19 to decide the question of issuing $35,000 in bonds for the construction and equipment of a municipal water works and sewerage plant.



EAU CLAIRE, WIS.—The city will start waterworks improvements shortly and will expend $125,000.

EVANSVILLE, WIS.—Architects Perkins, Fellows & Hamilton, 814 Tower court, Chicago, are preparing plans for a new $150,000 high school, which will include a complete manual training school.

FOND DU LAC, WIS.—Architect J. E. Hennen is preparing plans for a 3-story factory and shop addition, 100 x 100 feet, for the Northern Casket Co., manufacturing wooden and metal caskets. The work will cost about $100,000 including new machinery. William Mauthe is president.

GREEN BAY, WIS.—Plans for a 2-story factory

Gears for All Types of Rolling Mill Service

Open Hearth Steel Castings
FALK HERRINGBONE GEARS

Combine high efficiency, great reliability and long wearing quality with low upkeep.

These advantages, and many others can be derived from an installation of Falk Herringbone Gears.

Steel Castings from 1 to 100,000 lbs.

Write for Particulars

The Falk Company **Milwaukee, Wis.**

REPRESENTATIVES:

PITTSBURGH, W. O. Beyer, 1007 Park Building
SAN FRANCISCO, F. W. Grimwood, Rialto Bldg.
NEW YORK, M. P. Fillingham, 50 Church Street
DENVER, COLO., Denver Engineering Works
WILKES-BARRE, PENNA., Vulcan Iron Works

addition are being made for the Northern Corrugating Co. The new building will be 100 x 110 feet, and cost about $90,000. H. W. Krueger is president.

HARTFORD, WIS.—The Lohr Auto Co., Ford dealer, will build a 1-story addition, 66 x 100 feet, for machine shop use.

JANESVILLE, WIS.—Articles of incorporation have been filed by the Automotive Machine & Tool Co. to engage in the manufacture of tools, machines, jigs, etc. The organizers are J. R. Culhoun, B. S. Harder and B. W. Fitch.

KENOSHA, WIS.—Louis Schiffman, dealer in scrap metal, junk, etc., has purchased a site for a new scrap handling plant and yard representing an investment of about $35,000.

KEWASKUM, WIS.—The Kewaskum Aluminum Co. has let the general contract for its factory to John L. Stanage Co., 144 Oneida street, Milwaukee. It will be 2-story, 80 x 152 feet. A. L. Rosenheimer is president.

KIEL, WIS.—Stoelting Bros. Co., manufacturer of hardware specialties, has awarded a contract for a plant, 3-stories, 60 x 120 feet, to cost $50,000.

MADISON, WIS.—Contracts have been awarded by the Scanlon-Morris Co., maker of machine shop supplies, for a 2-story addition, 55 x 62 feet.

MADISON, WIS.—Articles of incorporation have been filed by the Johnson Specialty Co., Madison. The capital stock is $10,000 and the objects to manufacture and deal in mechanical appliances. The incorporators are T. C., J. A. and Orvey Johnson.

DETROIT.—The Monarch Foundry Co. will build a foundry, 100 x 200 feet, costing $100,000.

DETROIT.—The National Smelting & Refining Co. plans a foundry, 62 x 106 feet, to cost $30,000.

DETROIT.—The Halley Kerosene Carburetor Co., 145 Willis street, plans a plant addition, 1-story, 60 x 220 feet.

DETROIT.—The General Carbonic Co. will build a 1-story plant 100 x 120 feet, a boiler house 40 x 50 feet, costing $150,000.

DETROIT.—The Mutual Electric & Machine Co., 232 West Fort street, plans a plant addition, 3-stories, to cost $12,000.

CHICAGO.—The Doehler Die & Casting Co., 4129 North Campbell avenue, is building a plant.

CHICAGO.—William Ganschow Co., 1001 West Washington street, will build a 2-story machine shop, 32 x 175 feet.

CHICAGO.—The Ursus Motor Co. is building the first unit of a new plant, 60 x 300 feet, to house an automobile shop, paint shop, engineering and executive offices, and will cost $80,000.

CHICAGO.—The Continental Can Co., 111 West Washington street, has had plans drawn for a plant to cost $200,000.

CHICAGO.—The American Foundry Equipment Co., 110 South Dearborn street, contemplates a machine shop, 1-story, 100 x 200 feet.

CHICAGO.—The Advance Machinery Co., 4645 Ravenswood avenue, contemplates a plant addition, 58 x 100 feet, to cost $10,000.

CHICAGO.—The Jenkins Hydraulic Hoist Co. recently was incorporated with $12,000 capital, by John R. Junkin, Floyd I. Clark and Frank W. Fries.

RANKIN, ILL.—This city plans to start work shortly on a power house, 1-story, 30 x 86 feet.

AKRON, O.—The Goodyear Tire & Rubber Co. is having plans drawn for a machine shop, 5-stories, 160 x 520 feet.

AKRON, O.—The State Foundry Co., 116 Atlas street, is reported contemplating a foundry, 80 x 100 feet, to cost $30,000.

AKRON, O.—The India Machine & Rubber Mold Co. has been incorporated with $100,000 capital, by Walter C. Wenk, Thomas Cline, Jess Letherby, Nat Williams and Russell E. Baer.

CANTON, O.—The Canton Slag Co. recently was incorporated with 50,000 capital, by Richard D. Logan, H. M. Sharp and others.

CINCINNATI.—The Cincinnati Shaper Co. is reported planning an addition, 2-stories, 90 x 240 feet.

CINCINNATI.—The Production Machinery Co. recently was incorporated with $53,750, by E. R. Grossman, Robert Ellison and others.

CLEVELAND.—The Hydraulic Pressed Steel Co., James H. Foster, president, plans to enlarge.

CLEVELAND.—The Rubay Co., 1328 West Seventy-eighth street, is planning an addition, 1-story, 100 x 200 feet.

CLEVELAND.—The Standard Wire & Spring Co., 5915 Bonna avenue, contemplates a building, 90 x 145 feet, 2-stories. The company manufactures coil springs.

CLEVELAND.—The Cleveland Appliance Co. recently was incorporated with $1500 capital, by C. F. Shuler, K. Murman, C. E. Curphen, Thomas P. Schmidt and E. E. Kinnison.

DAYTON, O.—The William Dennick Foundry plans an addition.

DAYTON, O.—The Dayton Castings Co. according to reports contemplates a plant.

DAYTON, O.—Standard Register Co. is erecting an addition affording 8000 square feet of floor space.

DAYTON, O.—The Dayton Metal Bodies Co. plans a plant addition, 1-story, 60 x 100 feet, to cost $35,000.

DAYTON, O.—The Seibold, Mien Co. plans an office building and machine shop, at an estimated cost of $125,000.

DAYTON, O.—Domestic Engineering Co. has purchased the 4-story plant of the Mutual Mfg. Co., Taylor street, and will use it for making farm lighting systems.

DAYTON, O.—Barkalew Metal Products Co., 131 East Second street, has purchased the former car barns of the Green line railroad, Richard street. The company makes automatic screw machine parts.

DAYTON, O.—The Duriron Castings Co., 110 West Bayard street, will take bids soon for an office building, 2-stories, 40 x 97 feet, to cost $25,000.

DAYTON, O.—Assets of the Stone Propeller Co. have been sold to members of the Stinson family, aviators, including Catherine and Marjorie, and James R. Stinson and the family will form a company for the manufactrue of airplanes.

ELYRIA, O.—The City Metal Casting Co. recently was incorporated with $4000 capital, by C. A. Dawson and James Melet.

ELYRIA, O.—The R. & S. Non-Deflecting Valve Co. has been incorporated with $200,000 capital, by Ralph Murbach, Carl Ingwer and others.

FINDLAY, O.—The Findlay Engineering & Mfg. Co. has increased its capital from $25,000 to $60,000.

FINDLAY, O.—The property of the Findlay Iron & Coal Co. has been purchased by the Findlay Engineering & Mfg. Co., and the new owners plan a foundry building.

GREENVILLE, O.—The Daisy Fence & Post Co. recently was incorporated with $100,000 capital, by C. A. Stoltz, G. W. Rhodes, H. P. Stocker and T. M. Stoltz.

MASSILLON, O.—The Peerless Machine & Steel Co. is said to have made arrangements for an addition, 1-story, 109 x 400 feet, to cost $150,000.

PIQUA, O.—The French Oil Mill Machinery Co. is erecting a power house, 1-story, 82 x 84 feet, at an estimated cost of $25,000.

Business in Canada

LES FORGES RAPIDS, QUE.—The Shawinigan Water & Power Co., Shawinigan Falls, Que., plans hydroelectric development here.

MONTREAL, QUE.—Construction has started in connection with an addition to the bolt and nut plant of the Steel Co. of Canada, here.

MONTREAL, QUE.—Moore, Cameron & Hill, Ltd., has been incorporated to manufacture railway, marine and contractors supplies, with $100,000 capital, by A. Wainwright, A. H. Elder, Felix W. Hackett and others.

MONTREAL, QUE.—The Crescent Motors, Ltd., have been incorporated to manufacture motors, engines, automobiles, etc., with $100,000 capital, by Francis G. Bush, Herbert W. Jackson, George R. Drennan and others.

MONTREAL, QUE.—La Compagnie de Glacieres C. P. Fabien, Ltd., has been incorporated to manufacture refrigerators, machinery, cold storage equipment, etc., with $100,000 capital, by Jean M. Fraser, Joseph Lavoie, Joseph N. Chabot and others.

BELLEVILLE, ONT.—The Elliot Machinery Co., Ltd., has been incorporated with a capital of $250,000 to take over the plant and business of the Elliot Woodworker Co., and the plant and property of the Burrell Rock Drill Co., Ltd., Belleville, Ont. The incorporators are Wilson S. Morden, 172 Roxboro street east; Carroll D. Dyke, 768 Shaw street; and others.

BRANTFORD, ONT.—The Brantford Roofing Co., Sydenham street, will build a factory addition to cost $10,000.

BRIDGEBURG, ONT.—The Reliance Mfg. Co., capitalized at $500,000, will establish a plant on Lewis street, for the manufacture of electrical goods.

GALT, ONT.—McCaskey Systems, Ltd., Carlaw avenue, Toronto, Ont., will move its plant to Galt. The company will take over the plant of the Roelofson Machine Tool Co., Beverley street, and will equip it for the manufacture of counter checkbooks, credit registers, and professional systems.

HAMILTON, ONT.—The International Plow Works, Ltd., has awarded the general contract for a plant to cost $200,000.

HAMILTON, ONT.—The Universal Battery Co., Ltd., has been incorporated with $40,000 capital, by William F. Bayliss, Arthur J. Lainchburg, John P. Douglas and others.

MILVERYON, ONT.—The town has employed the E. A. James Co., Excelsior Life building, Toronto, Ont., to prepare plans for waterworks installation.

OTTAWA, ONT.—The Ottawa Car Co., Slater street, has awarded the steel contract to the Dominion Bridge Co., Spark street, in connection with a brass foundry to cost $25,000.

OTTAWA, ONT.—The Celex Mfg. Co., Ltd., has been incorporated with $30,000 capital to manufacture metal and wood specialties, by Frank R. Burgess, Robert H. Pringle and George F. Perley.

STRATFORD, ONT.—The Canadian Phonograph Motors, Ltd., has been incorporated to manufacture motors, etc., with $100,000 capital, by William Preston, David Wright and John R. MacDonald.

TORONTO, ONT.—The Canadian National Carbon Co., 265 Adelaide street west, has a site and will build a plant.

TORONTO, ONT.—The Hopkins Auto Top Renew Co., 200 Gerrard street east, is building a factory addition to cost $10,000.

TORONTO, ONT.—The Canadian General Fire Extinguisher Co., 2440 Dundas street west, will erect a plant to cost $500,000.

TORONTO, ONT.—The Canadian Fairbanks-Morse Co., 1383 Bloor street west, let contracts in connection with a manufacturing building to cost $35,000.

TORONTO, ONT.—The National Steel Car Corp. has been incorporated by James S. Lovell, 25 King street west; George G. Paulin, 76 Grosvenor street;

and others with $500,000 capital. The company will take over the plant of the National Steel Car Co.; and will carry on the manufacture of cars, railroad equipment, machinery, tools, etc.

TORONTO, ONT.—The Baldwin's Canadian Steel Corp., Ltd., has been incorporated by James S. Lowell, 25 King street west; William Bain, Robert Gowans and others with $500,000 capital. The company took over the plant of the British Forgings, Ltd., Ashbridges Bay, Toronto, Ont., and is putting it in order and building an addition for the manufacture of iron, steel, castings, bars, blooms, billets, tin plate, etc.

WALKERVILLE, ONT.—The Hills-Jansen Co., Ltd., has been incorporated with $40,000 capital to manufacture automobile accessories, by C. A. Hills, William B. Jansen and others.

WOODSTOCK, ONT.—The Delong Hook & Eye Co., will establish a plant here for the manufacture of hooks, eyes, safety pins, dome fasteners, and all kinds of steel and wire products.

Business Changes Recently Announced by the Trade

RECENTLY reorganized with J. F. Hines as president, the Madison Pattern & Flask Works, Cleveland, has removed its headquarters to a new plant at 10108 Detroit avenue, that city. Facilities for the production of wood, plaster and metal patterns and for the manufacture of flasks, have been increased by the addition of equipment, etc. A cupola is being installed together with suitable molding and pouring facilities to melt the plant's own nonferrous metals.

* * *

Henry T. Parsons, 309 Hostetter building, Pittsburgh, has changed the name of his general machinery business to Parsons-Moorhead Machinery Co., William L. Moorhead having become affiliated with him.

* * *

The Pacific Coast Steel Co. announces the removal of its Portland, Oreg., office to the Multnomah hotel building. W. J. Maguire is sales agent.

* * *

The Battery Park Trading Co., Inc., has been located at 50 Broad street, New York City, since Nov. 1.

* * *

Following the death of W. P. Sparks, formerly manager of the Indianapolis office of the Cleveland Milling Machine Co., Cleveland, that office has been discontinued. The Indianapolis territory will be covered by D. B. Clark, manager of the company's Chicago office,, 435 Stock Exchange building, Chicago.

* * *

The Federal Bridge & Structural Co., Waukesha, Wis., has reopened its Chicago office, 1228 Peoples Gas building, in charge of M. E. Allen, contracting engineer.

* * *

The Kol-Ben Wire Wheel Co., Detroit, will move to Cadillac, Mich., as soon as a new plant is erected there.

* * *

The Gairing & Needham Tool Co., Detroit, capital $25,000, has changed its name to the Gairing Tool Co.

* * *

The O. S. Bearings Co. has moved into new quarters at 214-18 Artillery avenue, Detroit.

* * *

The Wolf Emery Wheel Co., Meriden, Conn., has recently incorporated under the new name of Wolf New Process Emery Wheel Co., with a capital stock of $500,000. The present plans contemplate expansion of the business to at least three times its past capacity. A new concrete factory will be built to the north of the present factory.

* * *

The name of the Delta Electric Engineering Co., Philadelphia, has been changed to the Delta Equipment Co., 140-142 North Third street, that city.

* * *

The Ohio Blower Co., Cleveland, has changed its name to the Ohio Body & Blower Co.

* * *

The Reading Iron Co., Reading, Pa., has opened new district sales offices in Pittsburgh and Chicago, in charge of F. M. English and R. A. Griffin, respectively.

* * *

The Ingersoll-Rand Co., New York, has opened a branch office in the Sam Houston Life building, Dallas, Tex., to handle the Texas and Oklahoma territory. It is in charge of R. H. Brown, formerly of the St. Louis office.

* * *

The Black & Decker Mfg. Co., Towson Heights, Baltimore, has opened a branch office at 201 Maynard building, Seattle, in charge of A. E. Nordwall.

* * *

The American Chain Co., New York, is opening a branch sales office in Pittsburgh, in charge of W. R. Dawson. It is located in the Bowman building, Third avenue and Ross street, Pittsburgh, and will be ready for business shortly after Dec. 1.

* * *

The Hills, McCanna Co., Chicago, brass and aluminum castings, has acquired a plant at 2025 Elston avenue, Chicago.

* * *

Peter Beck, dealer in railroad and manufacturers' supplies, has moved his offices from 50 Church street to 105 Chambers street, New York City.

* * *

Offices have been opened at 702 First National Bank building, Cincinnati, by Maynard French & Co., who will engage in business as agents for the sale of iron and steel products on a commission basis.

* * *

The Worcester Lathe Co., Worcester, Mass., of which Alonzo W. Whitcomb, formerly president of the Whitcomb-Blaisdell Machine Tool Co., of that city, is the owner, has removed from 68 Prescott street, to the rear of 35 Hermon street, Worcester, its lease of the former premises having expired. It has taken two floors in the A. H. Steele Co. factory, which has moved to its new plant.

* * *

W. M. MacCleary has acquired the entire interest of W. M. MacCleary & Co., 2 Rector street, New York City, and will operate solely under his own name. The company deals in iron and steel products.

* * *

The Interstate Iron & Steel Co., 104 South Michigan avenue, Chicago, has opened an office in the First Wisconsin National Bank building, Milwaukee, in charge of Arthur R. Jones, assisted by Charles Belik, formerly of the head office. The Interstate company has appointed the Certes Supply Co., St. Louis, as its sales representative in that territory.

* * *

The Pittsburgh Screw & Bolt Co. has opened branch offices in New York City, at 50 East Forty-second street, with J. Allen Dillon in charge as manager of sales.

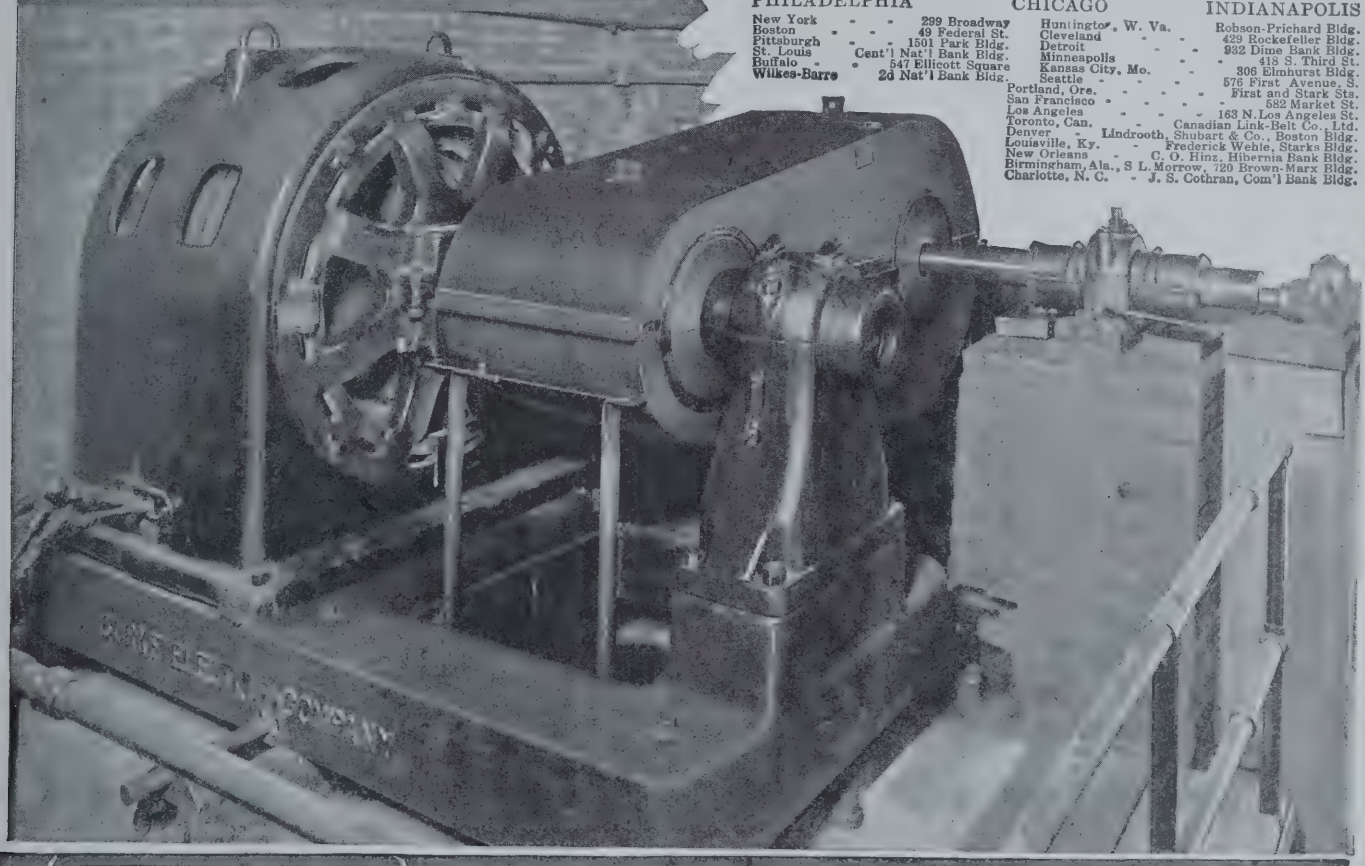
Why Link-Belt Silent Chain is the Correct Drive



COULD any other form of power transmission operate with efficiency on the short centers shown in these illustrations? This drive like hundreds of others, is operating almost continuously—it has never been shut down for repairs. The plant in which it is installed depends upon its constant daily performance.

Note the drive is enclosed in the patented Link-Belt oil-tight, dust-proof casing. Lubrication automatically reaches the chain. Safety to employees is assured. And the drive is, like all Link-Belt Silent Chain Drives, 98.2% efficient.

Let us show you where you can use an efficient Link-Belt Silent Chain Drive in your plant.

LINK-BELT COMPANY 384

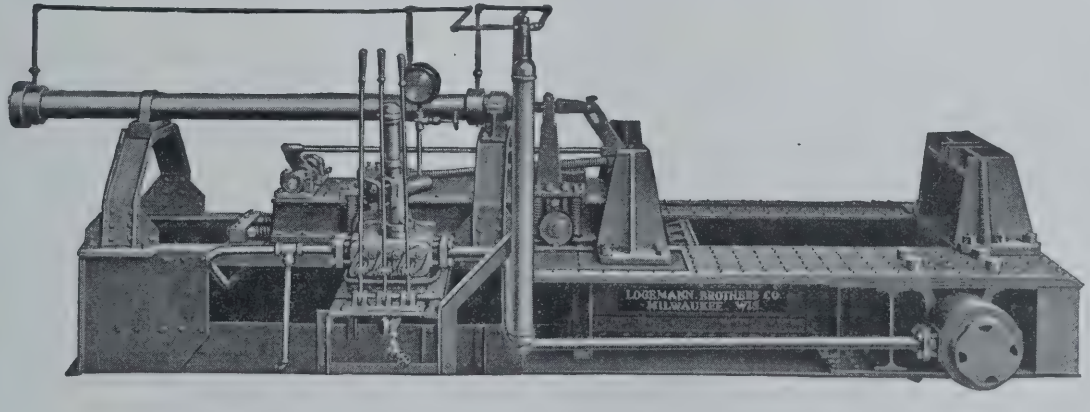
When the Scrap Market Is Dull

While seeking a more favorable market the best form in which to hold your sheet scrap, etc., and the form that always commands the best prices is the dense hydraulically compressed bundle.

Thus less storage space is required—under roof to prevent loss from corrosion; and because of greater car tonnage under minimum car rate, you add from 25% to 50% freight savings to your profits.



For greatest compression, largest daily output, at lowest operating cost, use

LOGEMANN Double Ram Hydraulic Scrap Metal PRESSES

You can enjoy the advantage of the accumulated experience from hundreds of Logemann scrap bundling presses now in use.

They embody a simplified mechanism that requires no special skill to operate rapidly. Press and pump are so designed that all the motive power applied is utilized, thus reducing power cost.

Powerfully built, all working parts constructed to resist the severest strains—selected material, first class workmanship—all minimize upkeep cost and insure lasting efficiency.

A medium sized press is shown; there are smaller and larger sizes in standard models.

Advise character and daily tonnage of your scrap and let us suggest press best suited to your requirements.

New Trade Publications

SAND-BLASTING.—The W. W. Sly Mfg. Co., Cleveland, has published the November issue of its pamphlet, and in it a description of a "baby" sandblast barrel is given.

DRILL STEEL.—The Ingersoll-Rand Co., New York, is distributing a 28-page booklet in which steel for rock drilling purposes is described and illustrated. Specifications, etc., of steel for various drilling purposes are given.

METAL HOSE.—The United Metal Hose Co., Inc., New York, is circulating a 4-page cardboard circular in which two kinds of flexible metal hose are described and illustrated. Specifications, etc., are given.

STOPEHAMMERS.—A drill for stoping, raising and other work in which holes are above the horizontal is described and illustrated in a booklet recently published by the Ingersoll-Rand Co., New York. This drill is all steel and is furnished with three styles of air feeds and supplied in light and heavy patterns.

DRILL.—A powerful drill designed for shaft sinking and capable of drilling holes of comparatively large diameter to a depth of 12 feet, is described and illustrated in a booklet recently published by the Ingersoll-Rand Co., New York. The drill is of all steel construction.

TOOLS.—Catalog No. 17 has been issued by the Clark Equipment Co., Buchanon, Mich., in which twist drills, reamers, countersinks, flue cutters, lathe tools and chucks are described and illustrated. Specifications are given as well as other data including, drill feeds and speeds, decimal equivalents, tap sizes, etc.

GAS MEASUREMENT.—Pamphlet P, an 8-page leaflet in which Pitot tubes and orifices for measuring the flow of gases in connection with flow meters, are described and illustrated, is being circulated by the Bacharach Industrial Instrument Co., Pittsburgh. The leaflet contains a number of line drawings of these instruments, and the data given shows how they are employed in measuring the flow of gas.

ROLLING MILL MACHINERY.—The Youngstown Foundry & Machine Co., Youngstown, O., has published a booklet in which rolling mill and steel works machinery is described and illustrated. The equipment described includes roll lathes, lever shears, vertical shears, automatic spike machines, boat spike machines, charging box cars, ingot cars, straightening machines, sand-chilled and semisteel rolls.

HEAT INSULATIONS.—The Franklin Mfg. Co., Franklin, Pa., is circulating a large booklet in which pipe coverings such as magnesia, asbestos, etc., are described. The first part of the booklet is devoted to a description of the company's products. The second part consists of sales data and a third section serves as a reference department and contains much valuable information to purchasers of this material. The booklet contains a number of illustrations.

PRESSURE INDICATOR.—A 4-page leaflet has been published by the Bacharach Industrial Instrument Co., Pittsburgh, in which a pressure volume indicator for the control of air delivery to cupolas, is described and illustrated. The instruments consist of a pitot tube installed in the blast pipe and connected to the indicator, which is an inclined tube gage, inclosed so as to be dust proof. The scale is graduted so as to read in cubic feet of air delivered per minute.

AIR COMPRESSORS.—A 10-page booklet is being distributed by the Ingersoll-Rand Co., New York, in which air compressors for belt drive, are described and illustrated. The type described is of the vertical, single stage, single acting, self-oiling, enclosed, center crank design, and is equipped with a heavy main frame, which encloses the main bearings, crankshaft and connecting rod. The air compressing cylinder is on the top of the main frame, to which it is secured by suitable stud bolts. Full details are given.

HOT-BLAST HEATER.—Robert Gordon, Inc., Chicago, has published an 8-page booklet in which a mechanical hot-blast heater is described and illustrated. This heater is designed for use in heating, large or small buildings, foundries of all sizes, factories, garages, temporary buildings, schools, etc., and can be used for drying clay products, asbestos, magnesia, textiles and other products dried by warm air up to a temperature of 400 degrees Fahr. Specifications are given as well as a description of the construction.

FOUNDRY SUPPLIES.—A cloth-bound catalog has been published by Frederic B. Stevens, Detroit, in which complete foundry supplies are listed, described and illustrated. The book not only is a catalog but serves as a reference book, containing valuable information relating to foundry materials, electroplating supplies, firebrick and their respectives uses. The foundry supplies described are: Oils, sand, etc.; cupola furnace; pressure gages; blast volume meter; blowers; elevators; general foundry tools; sand mixers; molding machines, etc. Complete data pertaining to each article or material are given and all equipment is illustrated.

OIL ENGINES.—J. Samuel White & Co., Ltd., East Cowes, Isle of Wight, is circulating an illustrated booklet in which heavy oil engines are described and illustrated. These engines are manufactured by the company in two types and range in power from 150 boiler horsepower to 2000 boiler horsepower. The heavy slow running type is for mercantile marine and land installations. The light type is for special service, including submarines. All marine engines are directing reversible and can be reversed from full ahead to full astern in a few seconds. The starting and reversing gears are simple and readily accessible. The full-speed revolutions can be reduced ⅓ in number for slow running or cruising speeds. Both types work on the 2-cycle principle. The booklet contains a complete description of the engines and besides a number of halftone illustrations, 10 line drawings, showing the various parts of the engines are given.

Opportunities Abroad

Requests for information should be forwarded to district or co-operative office in your district, of the Bureau of Foreign and Domestic Commerce. Each request should be on a separate sheet and be accompanied by the opportunity number

DISTRICT OFFICES

New York, 734 Customhouse; Boston, 1801 Customhouse; Chicago, 504 Federal bldg.; St. Louis, 402 Third Nat'l Bank; New Orleans, Hibernia Bank; Seattle, Henry bldg.; San Francisco, 307 Customhouse

CO-OPERATIVE OFFICES

Cleveland, Chamber of Commerce; Cincinnati, Chamber of Commerce; Los Angeles, Chamber of Commerce; Philadelphia, Chamber of Commerce; Portland, Oreg. Chamber of Commerce; Dayton, Ohio, Chamber of Commerce; Pittsburgh, Chamber of Commerce

A commission agent from Egypt who has been in the United States for several years, is about to return to his native country and desires agencies for the sale of agricultural implements and machinery. Opportunity No. 31353.

An agency is desired by a party in Spain for the sale of mechanical toys, electrical goods and dental supplies. Correspondence should be in Spanish or French. Opportunity No. 31358.

An American Firm of purchasing agents for a manufacturing company in Brazil desires catalogs and quotations in duplicate for the purchase of machinery for the production of bottles. window glass, insulators, etc. Opportunity No. 31364.

A company in Greece desires to purchase and secure an agency for the sale of machinery for building purposes, such as cranes, wagons, aerial wagons for transporting coal, etc., and other machinery. Iron and steel mchinery used in building, railway rails, motor trucks, etc. Opportunity No. 31378.

An Austrian railway company desires to purchase monthly about 30 tons of copper needed in locomotive production, especially such copper as is used in making bars, plates and tubes. Offers should be accompanied with an anlaysis of the copper. Opportunity No. 31380.

A company in Denmark desires an agency for the sale of pig iron metals, especially steel, tool steel, machine tools, mining machinery, etc. Opportunity No. 31385.

A commercial agent in France desires to secure an agency on a commission basis for the sale of electrical apparatus, such as wire, insulators, switches, lamps, reflectors, etc. Opportunity No. 31386.

The purchase of 7-foot radial drilling machines for drilling rivet holes in boiler plates, is desired by a firm in England. Opportunity No. 31387.

A firm in England having a branch office in this country, desires to be placed in touch with manufacturers of electrical labor-saving appliances, with a view to their sale in England. It is particularly interested in washing machines, vacuum cleaners, dish-washing machines, electrical clothes dryers, motor-driven sewing machines and electrical water-heating apparatus. Opportunity No. 31394.

An importer in France desires to secure an agency for the sale of hardware, enameled ware, household appliances, electrical supplies, novelties, etc. Opportunity No. 31395.

A company in Honduras desires to purchase machinery for an ice plant, capable of producing 3500 pounds a day. Quotations wanted on both electric and steam machinery. Complete information should be furnished with first communication. Opportunity No. 31396.

A firm in France desires to purchase annealed mild steel; unleaded, 15 to 100 millimeters; leaded, 20 to 100 millimeters; length from 80 to 100 meters; width from 41 to 22 millimeters. Sixty tons of this steel are desired at once and are to be used in making tubing for electrical fixtures. Opportunity No. 31397.

The purchase is desired by a firm in China of tinplate suitable for making cans, wire nails, iron wood screws, steel butts, padlocks, rotary shears, etc. Opportunity No. 31401.

THE IRON TRADE REVIEW

Vol. LXV Cleveland, December 11, 1919 *No. 24*

Coal Relief is Sorely Needed

Impending Strike Settlement Finds Iron and Steel Industry in Initial Stage of Sweeping Curtailment of Production—Scarcity of Material Grows and Makers Decline New Business—Coke Control Stays Feverish Rise

PROMISED settlement of the coal strike has come at the critical moment for the iron and steel industry when a sweeping contraction of production has seemed unescapable. Even now, it is a serious question whether the curtailment of operations already well under way can be arrested in its first stage before a free movement of coal and coke supplies to crippled plants can be restored. The past week has shown a spread of the paralyzing effects of a restriction of fuel requirements, to a degree where the loss of output, in many cases, has been more extensive than during the steel strike. Various plants which had managed to maintain operation at or only slightly below a normal basis, against direct labor disturbance, have been forced to yield sharply to the narrowed distribution of fuel. It is apparent that a few weeks more of present conditions and the iron and steel makers literally would have been swamped with deferred obligations which would have made a clearing of their books a tremendous problem.

Many Plants Crippled

The list of additional shutdowns of plants for the week as the result of the coal crisis, is a lengthy one. Many sheet mills have been forced to close and others have been crippled at a time when the shortage in this product is pronounced to be the greatest the country ever has known. The additional loss of output in tin plate and wire has been heavy. Tubular goods have been affected considerably and the largest maker has been obliged to lighten up production in its various plants. In the Youngstown district several large plants have suspended completely. A leading Pittsburgh independent has been reduced from practically 100 per cent to not over 60 per cent operations. Eight out of 12 blast furnaces at Gary, 5 out of 11 at South Chicago and one out of four at Joliet are running. The Joliet mills are down. Few merchant furnaces have been forced to bank or go out.

Under present conditions of shortage, export business is severely restricted. Some sizable sales have been made, however, including 16,000 tons of rails to Chile, and 12,000 tons of tank plates and 21,500 boxes of tin plate to Japan. The steel for a 3500-ton zinc smelter for India has been placed tentatively.

Coke Under Control

A return of government price control over coke is the culmination of a feverish week in that product. Spot coke had been sold at $10 to $12, ovens, just before the fuel administration intervened. Fixed prices now in force are $6 for furnace and $7 for foundry beehive coke, Connellsville ovens, with modifications for other districts and $6.70 for by-product selected foundry grade The 25 per cent curtailment of coal supplies to beehive ovens ordered by the fuel administration went into effect Monday. A further cut of 25 per cent is slated to follow Thursday, depending whether the miners accept the government's offer of settlement.

New steel orders, no matter how attractive in size or price, have been going begging. Many mills have closed their badly congested order books to every importunity or device of buyers. A Detroit automobile manufacturer has been seeking in vain to place 100,000 tons of strip steel. A 10,000-ton steel bar inquiry at Pittsburgh has elicited little interest. In the East mills have enough tonnage of steel bars to run into the third quarter and are selling considerable tonnage at 3.50c, Pittsburgh, against the regular level of 2.35c, Pittsburgh. Semifinished material can scarcely be had. A sale of sheet bars has been made at $50, Pittsburgh. In the East rerolling billets have brought $50, Pittsburgh, and slabs, $52.50.

No Stop In Iron Rise

The pig iron market is steadier though exceedingly strong and the great majority of the sellers are declining further tonnage. Valley basic and bessemer have advanced another $1 to $34 and $35, furnace. Eastern basic has reached $35, furnace. Standard low phosphorus is up to $45, furnace, in the East and to $42, valley. Chicago producers are quoting $40, furnace, on No. 2 foundry, based on $45, Birmingham, and have made various sales at this figure. The base foundry grade in other districts ranges from $36 to $38, furnace.

Who Shall Lead the Engineers?

SELDOM, if ever, does the reader who glances casually at the list of newly elected officers of an organization go to the trouble of analyzing the occupations of the office holders unless it is plainly evident from cursory examination that one profession, trade, or branch of industry is represented by an unusually large percentage of the new incumbents. Therefore, it would be interesting to know how many persons who read the names of men recently elected to office in the American Society of Mechanical Engineers, are struck by the fact that of the seven in the list, four or 60 per cent are identified with institutions of learning or technical branches of departments of the federal government.

Were this high percentage an exception to the general rule, it would not be significant. However, there always has been a tendency to place theoretical engineers, scientists, etc., at the head of and in charge of the policies of so-called engineering societies. Notwithstanding the fact that the names of many notable, practical and successful engineers and manufacturers, such as Henry R. Towne, Charles E. Billings, John Fritz, Worcester R. Warner, S. T. Wellman, Ambrose Swasey and George Westinghouse, appear on the list of the past presidents of the society, the majority of the presidents have come from the laboratories and classrooms of technical and engineering schools.

The preponderance of college men is even more noticeable in the activities of the engineering societies. Most of the committee work is undertaken by men associated with educational institutions, and in recent years, investigators with the United States bureau of mines and bureau of standards have carried a particularly heavy part of the burden imposed upon the members of the technical societies.

In view of these facts, one is tempted to ask why engineers and manufacturers who daily apply their technical training to practical problems do not take a more active part in the affairs of the societies. Can it be possible that the men who practice engineering as an adjunct to business do not have time to indulge in these activities, or is it true that the work of the engineering societies has acquired the hallmark of the class room, and therefore no longer interests practical men? These questions merit close attention, particularly by those who are charged with the successful guidance of the policies of the large engineering organizations. It should be possible to bring theoretical and practical men together on common ground, and any tendency which seems to point toward the domination of the engineering field by one faction to the detriment of the other should be checked before harm is done.

When Sanity Finally Returns

RESTORATION of the governmental wartime prices and regulations on coke have been the inevitable result of a continuance of the present acute shortage of coal which for the nation at large is becoming more desperate daily. This has followed quickly upon the pronouncement of the central coal committee to sharply restrict the supply of coal to beehive ovens, starting Dec. 8. The effect of this order plus the increased shortage of coal was to precipitate a violent rise in the spot coke market at the close of last week. Spot Connellsville coke then, it is understood, readily bought from $10 to $12 per ton as compared with $6.50 to $7 in the week preceding. The taking over of the control of the market by the fuel administration under the Lever act, which still is in force, then was announced. Under these regulations the beehive product is fixed at $6 ovens for 48-hour or furnace fuel and at $7 ovens for 72-hour or foundry coke subject to such modifications as fit local conditions. Under these latter Wise county Virginia furnace coke is listed at $7.25 ovens and foundry at $8.25 and New River and Pocohontas coke in West Virginia, at $8 ovens for both furnace and foundry grades. Selected by-

product foundry coke is placed at $6.70 base and run of oven, $5.70 base. To these base prices on by-product coke there is added the freight rate from the competing beehive coke district which takes the lowest rate to the point where such by-product coke is produced.

The return of the coke market to a fixed price basis under government control, reflects clearly the critical stage to which the stubborn attitude of the coal miners has brought the iron and steel industry and all other commercial and manufacturing activities of the country as well. This week has seen the beginning of a slowing down of production of iron and steel mills and blast furnaces on a large scale. If this situation is to continue unrelieved for an indefinite period, the consequences which would be freed could be nothing but disastrous for the country at large. Added to the large loss of output occasioned by the steel strike, it would pile up the arrearage of supply so overwhelmingly that it would be practically impossible for the mills ever to catch up, in view of the present excessive demand.

From the standpoint of business stability and the well-being of the whole country, the situation has reached the point where drastic measures are warranted and demanded. It is well that the coal miners at last have come to their senses and have appreciated this fact. In accepting the government's final offer of settlement they have spared themselves from a responsibility that would have become so heavy that no class or set of men lucidly could care to assume it before an outraged public. And they have avoided jeopardizing whatever of their honest dues and rights are tied up in the present controversy.

Pig Iron Registers Comeback

AS WAS predicted, failure of the steel strike was accompanied by a spectacular comeback in pig iron production, which was particularly noticeable during November. Inasmuch as the effect of any disturbance or impetus to production usually is not registered until the following month, the pig iron output of October indicated the degree to which blast furnace operation was affected during the early days of the strike, while the November record measures the recuperation after the breaking of the strike in October.

The production for November was 2,397,175 tons, a gain of 532,751 tons over the preceding month, bringing the total to within 84,000 tons of the September figure. But while October registered a large loss, merchant production increased over September, indicating that the steelmaking stacks suffered a loss greater than that represented by the total net loss. It is significant, therefore, that 87 per cent of the gain of November was made by the steelmaking stacks. These furnaces produced 1,732,296 tons, or 462,629 tons more than were produced in October, while merchant furnaces with 644,189 tons made a gain of 69,670 tons.

More noteworthy is the fact that of a net gain of 36 stacks placed in blast during the month, 32 were steelmaking stacks while only four were merchant stacks. Only 14 fewer furnaces were in blast on Nov. 30 than on Aug. 31 when the third highest number during the year was in operation. These figures prove conclusively that the steel strike affected the industry seriously for only a brief period and were it not that the coal shortage now is curtailing production, the December pig iron output would be practically normal.

Independents Rise to Power

THAT preponderant influence in the steel industry has not been used to repress competition and destroy rivals for trade is clearly shown in the wonderful growth of independent companies which have sprung up and prospered since the formation of the United States Steel Corp.

Taking an outlying province of the steel area as an illustration, the same situation being true of other localities, the Chicago field indicates that the presence of the stronger competitor has been no bar to success of other companies. Though represented in the Chicago district by four plants, two of which are among the largest and most efficient in the country, with an immense annual output, the leading interest has seen its competitors organize and grow rapidly. The Inland Steel Co., starting 17 years ago as little more than a rerolling proposition, now is fully integrated from ore mines to finishing mills and has grown to a capitalization of $30,000,000. This growth has been made since the Steel corporation was organized.

The Interstate Steel & Iron Co. is another example of the growth of a small bar iron mill to a position where it assumes rank with the larger steel interests. This company has three well equipped plants and a large capitalization, enjoys widespread trade, and markets a broad line of products. It is still growing and promises soon to occupy an even larger field.

That such expansion has gone on during the past few years in direct competition with the largest interest indicates that the steel business is conducted on lines which give every manufacturer freedom for initiative and development. The records of establishments which have grown into powerful organizations form significant proof of the stability and integrity of the iron and steel industry and of the men whose counsel wisely prevails.

Iron and Steel Prices

Pig Iron Market Grows Steadier

Advance of Prices Continues But Situation is Less Excitable—Chicago Producers Sell No. 2 Foundry at $40—Valley Basic Reaches $34 and Bessemer $35—Low Phosphorus in East Sells at $45

Pittsburgh, Dec. 9.—Another $1 per ton has been added in the past week to the price here on the three base grades of pig iron. Sizable sales of No. 2 foundry (1.75 to 2.25 silicon) for the first half from a valley furnace are noted at $36 furnace; of 3000 tons of standard bessemer for first half, at $35 furnace; and of a tonnage of basic, at $34 valley furnace. Lots of less than 1000 tons of both No. 2 foundry and standard bessemer have been made at least $1 above these quotations, but on basic $34 seems to be the top even on small tonnages. Where there is no lack of demand from consumers of this grade, many seem hesitant to pay more than that price. The market from certain indications has lost some of the excitement which recently characterized trading but this condition reflects unwillingness on the part of producers to accept much business at current levels rather than because buyers have fully covered their requirements. A number of consumers of all grades have not yet contracted for their first half of 1920 requirements and the remaining unpledged supplies have been reduced still further by the fact that a number of merchant furnaces, because of recent suspensions, will carry over considerable 1919 business into next year. In this connection, it is reported that one valley furnace has obligations amounting to 35,000 tons of basic, equal to about three months' production by this furnace. A Wheeling sanitary ware manufacturer is in the market for 2000 tons of No. 2 foundry and an equal tonnage of the same grade is being sought by one of the radiator companies in Johnstown, Pa. It is reported that about 2000 tons of No. 2 foundry is under negotiation by a Pittsburgh district consumer at $38 with a western Pennsylvania furnace interest. Most of the producers of foundry iron already are committed for all but a small portion of their first half production. A sale of 3000 tons of standard bessemer for first half was made to a Paden City, W. Va., maker of melting bars, and the buyer it is understood was quoted as high as $39 against this inquiry. Curtailment of production of beehive oven coke has not yet seriously affected the operation of blast furnaces in this district. The Carnegie Steel Co. has banked one of its city stacks for want of fuel. Three furnaces of the Jones & Laughlin Steel Co. have been banked because of coke shortage and one stack at Aliquippa has been blown out for relining.

Virginia Makers Sell Tonnage

Boston, Dec. 8.—Pig iron prices continue to mount in the New England market. The feature of the week was the opening of books by two Virginia furnaces for sales for prompt delivery. Both of these furnaces came in at a $35 price for the base grade (1.75 to 2.25 silicon) and both rapidly raised prices until in one case an advance of $3.50 was made in three days. One of the furnaces sold approximately 10,000 tons for New England delivery, and the other about 5000 tons. Both are now out of the market. Prices from all districts have advanced and available supplies have been continuously tightening until at present there is scarcely any to be had for first half delivery, and comparatively little for prompt. Some southern iron has been sold but Alabama furnaces still are out of the market except in unusual cases. An eastern Pennsylvania furnace sold several hundred tons to a Massachusetts consumer at $37 furnace for No. 2X (2.25 to 2.75 silicon) for prompt shipment. Another furnace from the same territory sold 500 tons of No. 2X at $39 furnace for prompt shipment. One central Massachusetts consumer bought a special analysis iron (silicon 2.00 to 2.50 and manganese 2.00 to 2.50) at $41 Virginia furnace. Another consumer bought 1000 tons of 2.75 to 3.25 silicon iron at $39 Virginia furnace for spot shipment. Another prompt order placed in Virginia was for 400 tons of 3.25 to 3.75 silicon at $41 furnace. A prominent textile machinery manufacturer came into the market during the week for part of its first half requirements and purchased a round tonnage, partly southern and partly northern iron. Prices continue to be secondary in many transactions, the consumer's chief question being whether he can secure the iron rather than what he will have to pay. Malleable has been particularly scarce for several weeks and a consumer who wanted 400 tons during the week carried his request as far west as Ohio and even then was unable to secure the amount required.

Speculators Expect Higher Prices

New York, Dec. 8.—As an indication of their faith in higher pig iron prices, speculative interests for some weeks have been trying to pick up tonnages to be held for a profit. It is understood that the iron which has been bought during the past two to three weeks, by speculators, amounts to more than 25,000 tons, for delivery mainly next year. It is said that a

rise of $2 to $3 a ton would serve to bring out much of this tonnage. Very little iron now is to be had from the furnaces. In fact, practically the only orders makers now are taking are those which the consumers are forcing upon them. There are some exceptions. One central Pennsylvania maker now is quoting $39, furnace, on 1.75 to 2.25; $40 on 2.25 to 2.75, and $41.25 on 2.75 to 3.25 silicon. Some eastern Pennsylvania foundry was sold during the week at $38 to $40, furnace, for 2.25 to 2.75 silicon. Some moderate-sized lots of 1.75 to 2.25 silicon were sold at $38, eastern Pennsylvania furnace. As an illustration of the tendency of prices, one round tonnage of Buffalo 2.25 to 2.75 silicon foundry for first quarter was sold at $40.25, Buffalo. The top was blown off the Pulaski Iron Co.'s furnace a few days ago and the opportunity during repairs will be utilized to reline this stack. A considerable tonnage of Virginia foundry for 1920 has been sold during the past week at as high as $38.50, furnace, for 2.25 to 2.75 silicon and $40, furnace, for 2.75 to 3.25 silicon. Some business in basic has been done in this district during the past week at $35, eastern Pennsylvania furnace, and this price is the minimum on the new inquiry now before sellers here.

Fair Tonnage is Sold

Buffalo, Dec. 9.—The heavy demand for all grades of iron continues in this district, but sales are few for first half because there is very little second quarter capacity left. First quarter iron is practically not to be hand, and prompt iron is a matter of a few tons to help out a hard-pressed foundryman. One furnace sold about 10,000 tons during the past week, but this is the only instance of so heavy a tonnage being contracted for. This interest still has iron to sell for first half. Another furnace interest reports the sale of a fair aggregate tonnage of No. 1X at $41 furnace. This is the first week in about a month that there has been no advance in the price of all three grades of foundry. The $38 to $41 schedule remains in effect. Malleable is being heavily sought in this market, but none is being made. One maker reports inquiries of 2000 tons, 3000 tons and 10,000 tons. This interest is out of the market for the first half. The nominal price for malleable is $39.25.

Basic Sells at $34

Cleveland, Dec. 9.—Sales of pig iron virtually are at a standstill since the uncertainty over the coal situation is keeping the furnaces, with few exceptions, out of the market. An active inquiry from consumers continues and wherever producers care to offer any material, even off-lots, this is speedily snapped up without regard to the price. The market is very strong but at just what point it rests at present is not clearly shown because of the absence of sales. It is indicated, however, that No. 2 foundry (1.75 to 2.25 silicon) is around $36 local furnace. Sales of valley No. 2 at $36 and $36.25 furnace are noted, in one case 1000 tons being involved. Early malleable also has been sold at $36.25 furnace and No. 1 foundry at $37 valley furnace. A lot of 4000 tons of basic for shipment this month to a northern Ohio steelmaker was placed at $34 valley furnace. A southern Ohio steel company is sounding the market on about 5000 tons of basic monthly for the first half of the year and will also consider second half. An Indiana foundry interest is inquiring for 5000 tons of foundry iron. The furnace of the United Furnace Co., Canton, O., has been forced out of blast on account of the coal situation at an earlier date than expected when recently it was planned to put out the stack for relining. The furnace will be out a number of weeks for relining.

Sells Misfit Tonnage

Youngstown, O., Dec. 9.—Consumers of pig iron find it practically impossible to obtain tonnages for spot shipment and consequently are turning their attention to misfit grades. Considerable business in this direction was done recently by one furnace interest in this district which disposed of 14,000 tons of off-grade basic iron at $32 valley furnace. A Cleveland dealer took about 1000 tons for resale in the East while 4000 tons were purchased by an open-hearth steelmaker in the Cleveland district. Considerable tonnages of misfit iron are available at certain valley furnaces due to irregular operation of blast furnaces after the recent suspension of several weeks.

Refusing Further Orders

Cincinnati, Dec. 8.—Producers in the South as well as in the Ironton district are very reluctant as to taking on any further business for future shipment. They claim there is no way to arrive at approximate future production costs at the present time and those whose order books are not filled for the first quarter, have decided to await developments before selling any more iron. In the South, occasional small tonnages of high silicon or off-iron for December shipment are being made to melters in need of the metal, but the total tonnage is very limited. The usual schedule of prices is not being maintained and a premium is generally paid for any iron that can be had for prompt shipment. Although $35 Birmingham, is a nominal quotation for first quarter, only a favored customer could obtain any iron at that figure or even $1 a ton higher. The last quoted price on Northern iron was $36.75 Ironton, but no recent transactions are to be noted in that district with the exception of a little silvery iron. The silvery furnaces in Jackson county are rushing repairs and all of them will be in full operation within a short time if able to get coke. Silvery iron of 8 per cent quality is quoted at $50 furnace.

Offerings Quickly Snapped Up

St. Louis, Dec. 6.—With a number of the leading producers out of the market, the demand for pig iron in this district is still a long way from satisfied. Offerings have been extremely light and are quickly snapped up. One maker at Birmingham had 1000 of off-iron for sale, but no standard grades, while several reported they had nothing of any description. Consumption, despite the coal strike, has kept up on an enormous scale. Foundries which have managed to keep in operation, are crowded with business, and could book more, were it possible to secure raw materials. Virtually nothing in the shape of spot iron is to be found and the difficulty experienced in purchasing for first half would indicate that heavy sales have been made for that period. Real apprehension is being felt by melters who have failed to provide for their needs. Deliveries from the South have been fairly good, all things considered. Some tonnages are filtering in from Chicago and other lake points, which fact has served to relieve the pressure to some extent. It is difficult to decide just what the price of No. 2 Southern foundry (1.75 to 2.25 silicon) is here. The representative of a leading Birmingham interest, which withdrew from the market early in the week, said the last price was $35 furnace for first half, but what the next would be he could not guess. It is difficult to quote a price to a customer, for the reason that it may be changed by telegraph before a sale can be closed.

Uncertainties Are Predominating

Birmingham, Ala., Dec. 9.—Uncertainties predominate in the pig iron market in the South. Many furnaces continue out of the market and numerous inquiries being received, are being passed by. In addition requests are piling in for deliveries on old contracts. The fuel situation gives promise of affecting not only the production of iron in this section during the week but also the train service, which will interfere with shipments. Sales last made were at $35 for No. 2 foundry (1.75 to 2.25 silicon). The need for iron in some sections apparently is acute. Many consumers are far from being covered for the first half. The aggregate of business booked for future delivery by Southern producers is large and the furnaces will have to be kept in steady operation to meet the demands. Local consumption is likely to become affected this week by reason of the fuel situation. The Alabama Co. started its second Gadsden furnace the past week but with short coke supply banking again may have to be necessary. Three furnaces may be out of commission by the end of the week if there is no relief.

Chicago Iron at $40

Chicago, Dec. 9.—Sales by two producers in this district seem to indicate that $40, furnace, for silicon 1.75 to 2.25, is the prevailing level. This is just equal to the delivered price of southern iron at $35, Birmingham. One interest which is practically out of the market is sometimes forced to accommodate a regular customer with a small tonnage and on such sales $39 and $40, furnace, has been quoted recently, with sales resulting. Another producer has taken about 1000 tons of foundry iron on the basis of $40, furnace, for 1.75 to 2.25 silicon. Aside from this selling local producers are out of the market.

Southern makers with one exception

are not willing to take further tonnage and none is willing to make contracts for future delivery. The exception noted above is that one producer has a small tonnage of iron for delivery during December on which $35, Birmingham, is being quoted. Not only are southern and local makers out of the market, but the Algoma Steel Co. now is not willing to sell, although it is believed it has some production for first half which has not been covered. A seller in the Chicago district has some southern iron for spot delivery running about 4 per cent silicon, which it is offering on the basis of $35, Birmingham, for 1.75 to 2.25 base. A recent sale involved 500 tons of bessemer iron at $36, valley, with $3.80 freight to Chicago, which was taken by a foundry interest. Under the fuel regulation limiting industrial operations to three days per week, demand for iron has lessened somewhat and if blast furnace operation is not curtailed equally, producers may be able to catch up to some degree on their deliveries. No interference has been made so far with deliveries of coke to blast furnace, but no one is clear as to whether they will be able to continue uninterruptedly. Although Jackson county producers of silveries are back in the market and quoting $50, furnace, for 8 per cent silicon, demand is not heavy, the price apparently being considered too high.

Low Phosphorus is Higher

Philadelphia, Dec. 9.—Low phosphorus iron has advanced sharply. About 3000 tons of standard iron for first half has been sold half at $42, furnace, and the rest at $45. The latter price now is minimum. Several thousand tons of copper-bearing iron were sold at $39 furnace. Sales since have been made at $40 and latter figure now is minimum. Basic has been sold only in small tonnages the past week, some at $35 eastern Pennsylvania furnace. The market now is $33 to $35 on the basis of recent business although the asking price now is $35 in all cases. The market on foundry iron on the basis of recent sales is $39 to $40 eastern Pennsylvania furnace for No. 2X (2.25 to 2.75 silicon) with $1 differential for No. 2 plain (1.75 to 2.25 silicon) and differential of $1 to $2 on No. 1X (2.75 to 3.25 silicon. Sales of good sized tonnages at the outside figure have been made. The minimum in central Pennsylvania now is $40 furnace No. 2X and minimum Virginia $38.25 furnace for No. 2X. Considerable inquiry continues to come out although not as much as before. The Stanley G. Flagg Mfg. Co. wants 2000 tons of basic and malleable for second quarter.

A sale of standard malleable has been made at $39 eastern Pennsylvania furnace and a liberal inquiry for this grade iron is being received by eastern makers.

The Scottish shipbuilding workers have made an application for a uniform minimum wage of 2s 2d (about 44 cents per hour).

Coke Has A Wild Week

Spot Fuel Reaches $10 to $11 Before Wartime Prices Control is Restored—May Cut Coal Allottments Further

Pittsburgh, Dec. 9.—After several weeks of exciting trading with prices moving up constantly, and culminating in sales late last week to a Pittsburgh steel company of furnace fuel at $11 ovens, the fuel administration again is functioning and has restored the wartime price of $6 for this grade and $7 for selected 72-hour coke. Announcement of the restoration of the old government maximum was made late Saturday night and applies on all new business on and after Dec. 8. Actual orders placed last week will be allowed to go forward at the prices settled on, but in the event of any reconsignment of shipments, the restored maximums are to govern the business. Contracts for first half coke already made also are unaffected by the change. Contracting for first half tonnages has ceased with the establishment of the new prices, for while a considerable tonnage still is unsold, those who have it, are loath to close at the new figure. This is because fixed price contracts closed as high as $7.50 ovens for furnace coke on sliding scales, based upon the valley price of basic pig iron, today have a value of $6.80 ovens on the present price of $34 for that grade of iron. Curtailment of the beehive oven production of coke began effective yesterday and it is rumored it may be necessary to make a further cut in the allotment of coal for the beehive ovens, even though the strike should be called off in a day or two. Officials of the Pennsylvania railroad, lines west, and the Pittsburgh and Lake Erie railroad have been instructed to stop their cars from loading coke on Wednesdays and Saturdays while the Pennsylvania railroad, lines east, is placing cars every day but only to the extent of 75 per cent of the number placed last week. Under this arrangement, ovens in the western end of the Connellsville region will not be drawn on Wednesdays and Saturdays while at the eastern end of the district, though cars will be available every day and daily drawing of ovens will be possible, there will not be sufficient cars to permit of full operations. The impression prevails here that the fuel administration will cease to function in both coal and coke once the production of the former reaches 75 per cent of normal. the supply. Sales of early foundry coke were made last week at about $10 ovens. The production of coke in the Connellsville region for the week ending Nov. 29 is estimated by the *Connellsville Courier* to have been 237,455 tons as compared with 231,304 tons in the previous week.

Deliveries Fall Behind

Boston, Dec. 8.—The government regulations on sale of bituminous coal has had the effect of increasing the demand for coke among industrial plants. Foundries in the majority of cases are fairly well supplied for this year, either through stocks on hand or by contracts. Coke deliveries however, in many cases, are falling behind due partly to car shortages and partly to the large demand for shipment. The Everett, Mass., producer reports an ample supply of coal on hand and good deliveries being made by water. None of the restrictions put into effect on account of the coal shortage have reached the by-product producers as yet and the price for spot coke still holds at $11.90 delivered.

Unusually Heavy Demand

New York, Dec. 8.—Demand for foundry coke during the past week has been unusually heavy and big sales have been made for first half involving both beehive and by-product fuel. Beehive sales were at $7, Connellsville, and in some cases at $7.50. The northern New Jersey by-product maker, who booked a large portion of the business, continues to quote $7, Connellsville, to this district, while to New England, it is quoting on the same basis as the New England producers, namely $7.50, Connellsville. It is reported that as high as $11 and $12, Connellsville, have been asked for spot foundry coke, and it is heard here that $8.75 to $9, Connellsville, was paid for spot furnace coke.

Demand Far Exceeds Supply

St. Louis, Dec. 8.—The demand for coke in this district well outstrips the demand, and with the proposed reduction in beehive product, the scarcity is likely to grow more acute. Dealers are beset with inquiries which they are unable to fill. Deliveries on contracts continue fairly good, but are arriving in a rather unusual and ragged assortment of equipment. Some contracting for the first half of 1920 has been reported, most of which has been on a basis of $7.25 ovens for foundry coke. All this business is subject to change in the present mining scale. The leading by-product distributor early in the week announced an advance of $1 on his coke, but reconsidered this action upon protest of the coal service bureau.

Production Greatly Curtailed

Birmingham, Ala., Dec. 9.—Fuel administration regulations have brought about a 50 per cent curtailment of coal supplies for beehive coke ovens in this district and by the end of the week the output of the ovens will be cut materially. Contracts are far behind. Some of the furnace companies have a supply of coke on hand that will last them 10 days or two weeks; others are not so fortunate. By-product coke ovens will not be interfered with. Prices advanced sharply in the week, foundry coke selling as high as $10, while furnace coke went to $8.

Scrap Exhibits Firmness

Effects of Enforced Reduction of Consumption Are Minimum—Cast Grades Are Scarce—Market Advances in Several Districts

FOR COMPLETE SCRAP PRICES SEE PAGE 1618

Philadelphia, Dec. 9.—Eastern steel mills lately have been eliminating dealers to some extent and been buying direct from producers. At least 2000 to 3000 tons of steel scrap were bought by mills from producers the past week at prices ranging $23 to $25 delivered which compares with $23 delivered the last price at which sizable tonnage was sold by the dealers. What the dealers now would do on any large tonnages that might be offered is not determined. Dealers say their minimum is $25 delivered on ordinary-sized tonnage. Whether dealers would offer concessions to retain their regular trade has not yet developed. There is a fair demand for railroad wrought and substitutes and higher is being paid. While there is strong upward trend in scrap prices there is greater spread due to present uncertainties. The coal strike is holding up some buying because the mills do not know whether they can operate. Cast scrap, car wheels and malleable are stronger with pig iron.

Various Grades Sell Higher

Boston, Dec. 8.—Following the unusual advance in pig iron, scrap iron and steel continues to rise. No. 1 machinery has been sold as high as $36 to consumers. A large Massachusetts foundry is offering $34 for 2000 tons, but so far has been unable to make the purchase. The large stocks of heavy melting steel piled in dealers' yards during the early summer now are finding their way in round tonnages to the Pennsylvania market centers. Dealers have paid as high as $18 for this grade in some cases. Borings and turnings have advanced. All grades of foundry scrap are in active demand. A sale of 400 tons of No. 1 cast was made during the week to an eastern Massachusetts consumer at $34.50. Heavy cast while not accumulating in large quantity is selling at $28 to $28.50. Malleable practically does not exist, and in the absence of sales the price remains nominally at $24 delivered to consumers. One Boston broker reports the past week as the best in his history.

Most Grades Advance

New York, Dec. 8.—Excepting clean cast borings, the market on scrap remains exceptionally strong. Cast borings, due to dull demand, has fallen off $1, now holding at $16.50 to $17, f.o.b. New York. But, aside from this and two instances where prices are unchanged, other materials have advanced. Heavy melting steel has gone up 50 cents, holding at $18.50 to $19, f.o.b. New York, and mixed borings and turnings have made a similar gain. City wrought and wrought pipe, grate bars, steel axles and shafting are up $1. In machinery cast, the market appears especially strong, prices having risen $2 to $27 to $28, f.o.b. New York.

Prices Show Much Firmness

Pittsburgh, Dec. 9.—In spite of the fact that the coal scarcity is affecting the operation of steel plants throughout the greater part of the country and in this market dealers have been getting a large number of suspending orders on contracts. Scrap prices are extremely slow to yield. The warning given by the intimations of a possible shutdown of the steel plants was sufficient apparently to cause a material curtailment of shipments by the dealers before actual contraction came on. While only small lots of heavy melting steel lately have been changing hands and these generally around $24.50, delivered, no round lot tonnages for the future could be obtained at less than $25 at that price. Dealers having held to their stocks through the period of the steel strike, are inclined to see through the present disturbances rather than make any sacrifices. In this attitude they are supported by some extremely high prices which evidently were paid on the December offerings of scrap by the Pennsylvania railroad, lines east. Several consumers and dealers here entered bids of as high as $24.50 for the heavy melting steel and failed to obtain a pound. The market is a shade easier on bundled and baled sheets for a little more of these grades is available than the present demand can absorb. No weakening is observed in railroad wrought for steel works use, but machine shop turnings and cast iron borings are slightly easier. Cast remains in extremely scant supply.

Uncertainty Causing Easing Up

Buffalo, Dec. 9.—Demand for all the grades on the scrap list keeps up in good volume. Heavy melting steel which began to ascend rather sharply, is stationary this week at $23.50, but large tonnages of this material are not available. Dealers still believe the market is on the rise, though the latter part of the week a lull was experienced due, it is believed, to the uncertainty over the coal supplies. The feverish demand of four or five days ago is showing a tendency to ease off. The satisfactory solution of the coal strike, will leave the market in the healthiest condition since before the steel strike. Prices remain unchanged on all grades.

Activity Has Subsided

Cleveland, Dec. 9.—Activity arising in the scrap iron and steel market a few days ago through the buying by dealers has subsided considerably, and little trading is in evidence. All the larger melters in the Cleveland district are out of the market. Many melters are hard hit by the coal shortage, and consumption of scrap has been reduced probably 25 per cent for this reason. The latter part of last week dealers were doing considerable buying of railroad steel—couplers, coiled spring, knuckles and the like—at Massillon, O., for $24.50 to $25. Almost any quantity of scrap can be bought by dealers, but little can be sold. Some negotiations are current on contracts for first half of 1920; in most cases the prices are about the present levels. Prices are unchanged with the exception of heavy cast, which has been marked up to $23 to $24.

Famine in Cast Grades

Chicago, Dec. 9.—Cast scrap is the feature of the present market and virtually a famine exists in this grade as foundries are seeking to buy more than the market offers. This condition results from uncertainty as to the delivery of pig iron, various hindrances to continued operation having reduced the supply of that material. Foundries are busy and in need of much raw material, and are turning to scrap to supply the deficiency. Dealers not able to figure all the inquiry for this class of scrap. Rolling mill grades are somewhat weaker on account of the absence of demand, all iron mills in the Chicago district being closed for lack of fuel. Steel grades are holding up well and some buying is being done in spite of reduced operation. A sale was made recently of melting steel for delivery during first quarter. Railroad offerings are unusually small. The Wabash offers 2300 tons, the Chicago, Milwaukee & St. Paul 500 tons, and the Burlington 315 tons.

Foundry Scrap in Demand

Cincinnati, Dec. 8.—Foundry scrap continues to gain strength and No. 1 cast is selling freely in carload lots to local and nearby foundries around $25.50. Mill scrap is still very slow, as the consumption has been reduced considerably, not only in the Pittsburgh district but elsewhere. A number of mills in Indiana are closed down on account of the coal shortage and a large local melter's plant is also idle for the same reason. Heavy yard accumulations of some grades of steel scrap are reported.

Upward Trend is Shown

St. Louis, Dec. 8.—The market for scrap iron and steel continues extremely irregular and nervous, but with a decidedly strong undertone. While there has been no heavy buying, the trend of prices is upward, and several material advances were marked in dealers' lists in the week. Eastern mills, according to advices received here, are buying heavily, and prices in that direction on certain materials have reached a point where it is possible to purchase here and ship at a profit. Holders are not pressing their stuff for sale. It is admitted that the immediate future of the local market is dependent largely upon the outcome of the coal strike, but regardless of how long that trouble is drawn out, scrap is scarce. Sales in the week largely were of material held on track by dealers. Cast grades, stove plate and grate bars especially

are in strong demand, with the supply virtually nil. Stove plate and light cast have been advanced $1 and No. 1 railroad cast is up $2. Rerollers are in good demand, with few coming out. Some scrap is coming in from the country. Offerings by the carriers in the week were as follows: Wabash, 2300 tons; St. Louis Terminal Railway association, 225 tons and the Missouri, Kansas & Texas, 1000 tons. All this material brought top prices.

Southern Market Very Firm

Birmingham, Ala., Dec. 9.—Dealers in old material in the Birmingham district report the market very firm. The demand for cast especially is strong. Car wheels are similarly active. Country scrap is lagging again. Consumers are urging deliveries as the shortage in pig iron continues more apparent.

Lost Tonnage

In Wire Products Now Further Increased—No Selling Being Done

Pittsburgh, Dec. 9.—Whatever gain recently has been made in the output of wire products with the passing of the strike of the steel workmen, largely has been lost in the past week through the fresh restrictions upon production imposed by the scarcity of coal. While all plants in this district are in operation, it is on a much more modified scale than recently and all makers have withdrawn from the market on new business for the present. Buyers are making persistant attempts to secure nails and both plain and barbed wire, but particularly the first named product. Quotations on nails of anywhere from $4 to $6 per keg, base Pittsburgh, are heard, but almost no business is going on and all quotations are nominal. No more attention is being paid to specifications against old orders than to new inquiries.

Supplies Still Insufficient

New York, Dec. 8.—Although output of the wire mills which were tied up by the strike is improving, there still is a great scarcity of all kinds of wire products. This is particularly true of nails and of wire for manufacturing purposes. Consumers using wire for manufacturing various kinds of goods continue to be forced to close down their plants or departments occasionally because of lack of material.

Mills Cease Selling

Chicago, Dec. 9.—After having been unable to take more than a small portion of the business offered, because of interference with production by the steel strike, wire mills have met the added handicap of fuel shortage and have retired from the market entirely. They will not sell further until the situation clears. Mill operation is being continued as far as possible, and shipments are being made on former orders to the full extent of production. Need for nails is the outstanding feature and demand for this product is unusually heavy.

Sheet Output Is Reduced

Coal Shortage Shuts Down Various Mills and Cripples Others—Valley Scarcity of Material Worst Ever Known

Pittsburgh, Dec. 9.—The coal shortage finally has resulted in the shutdown of a number of the sheet mills in various parts of the country and not a few of those still in operation are merely hobbling along, due to the fact that fuel stocks are so low that absolute economy is essential. This condition means a further backing up of business and a consequent delay in relief from the present shortage of early tonnage. Early settlement of the coal strike, however, will permit of fairly prompt resumption and since the coal strike is affecting those who buy sheets for further manufacture, as well as the manufacturers, it cannot be said that the prompt market is any tighter than it has been. Demands, however, remain large and insistent. There is no doubt that on a small part of the business substantial premiums over the regular market basis are being offered and are being accepted by some makers. At the same time the fact that both the American Sheet & Tin Plate Co. and many independent mills still are taking business from regular customers at the old basis and the premium sales involve a relatively small fraction of the total production, quotations of more than 4.35c, 5.70c and 3.55c, respectively on black, galvanized and blue annealed in the base grades hardly are warrented.

Demands Greatly Enlarged

Buffalo, Dec. 9.—The sheet demand in this district is very heavy. The mills are unprepared to cope with the demand. Five hundred tons is a minimum inquiry. One sales agency states that manufacturers seem anxious to cover on unheard of tonnages. The consumer that formerly came into the market for 100 tons for a quarter now is asking 400 to 500 tons.

Scarcity Worst Ever Seen

Youngstown, O., Dec. 9.—Not a pound of any grade of sheets is available at mills in the Mahoning valley for spot shipment and every mill is out of the market indefinitely. Never in the history of steelmaking here have the various grades of sheets been so scarce. During the war buyers found it difficult to obtain sheets but never so difficult that a few odds and ends could not be had. Conditions now however, are beyond comparison. Wasters and other sheet mill by-products have disappeared from the market, buyers taking these grades along with prime stock. No overage is being rolled which perhaps is best explained by the fact that mills for several weeks back have been taking on attractive specifications only. Consequently, present mill schedules are confined practically to merchant sizes. Any overage that is rolled, therefore, is applied on succeeding orders thus destroying all chances for a buyer to purchase any pick-up tonnages. Prices between 7.00c and 8.00c for spot black, without regard to sizes, are heard. Normal quotations for any grade of sheets are hard to determine. Large automobile companies are paying anywhere from $10 to $14 premiums for the scant tonnages they are fortunate enough to locate. The enormous demand for one-pass galvanized in light gages continues unsatisfied.

Few Mills Are Selling

Chicago, Dec. 9.—Local producers of steel sheets are entirely out of the market, and Ohio mills which have been selling some tonnage in the West find it difficult to proceed because of shortage of sheet bars. Consumers have difficulty in placing further tonnages, although demand is heavy.

Higher Prices for Blue Annealed

Philadelphia, Dec. 9.—The leading eastern maker of blue annealed sheets is sold up for the first quarter and is out of the market. Its list price was 3.75c, Pittsburgh, for No. 10. Some blue annealed has been sold in this district at 3.85c, Pittsburgh, and some consumers have offered to place tonnage at 4.00c, Pittsburgh, but the mill refused.

Reduced Scale

Of Operations is Shown Among the Tin Plate Mills

Pittsburgh, Dec. 9.—Scarcity of coal due to the strike of the miners is beginning to be felt by the makers of tin plate and where mills actually have not suspended, they are running on a reduced scale in order to make their moderate stocks of coal hold out as long as possible. One Pittsburgh independent is out of the market because of the danger of being obliged to suspend operations entirely, owing to the lack of coal and others are not anxious for new business, not only because of the insufficient fuel supply, but also because of the fact that present obligations cannot possibly be completed much before the end of the first quarter of next year. No let-up is noted in the demand and on early deliveries no trouble would be had in securing considerably more than the regular market basis of $7 per base box, Pittsburgh, for standard cokes.

To be Honor Guests

Isaac W. Frank, chairman of the executive board of the United Engineering & Foundry Co., Pittsburgh, will be the guest of honor, and E. Lowry Humes, United States district attorney for western Pennsylvania, will be the principal speaker at the annual Christmas meeting of the Pittsburgh Foundrymen's association, which will be held this year at the Elks' club, on the evening of Dec. 15.

Bar Shortage Now Acute

Many Mills Out of Market and Attractive Business Goes Begging—10,000 Tons Up at Pittsburgh—Deliveries in Doubt

Chicago, Dec. 9.—Steel bar mills are out of the market in the Chicago district and will not accept further business at present. This is due to the cumulative effect of various delays to production, the coal strike being the latest and most demoralizing. Orders for soft steel bars have been booked in unusual volume and most producers have sufficient business to cover practically all their first half production under ordinary operating conditions. With the delay incident to fuel difficulties, which is an unknown quantity at present, it is difficult to estimate how much bar tonnage may remain unsold. Under these circumstances, it is practically impossible to promise delivery and it is considered best to remain out of the market. Holders of contracts are specifying freely and not allowing any tonnage on books to lapse. The quotation is 2.62c, Chicago. All bar iron mills in this district are idle for lack of fuel and demand for this product is strong without possibility of placing business definitely. One producer already has sufficient tonnage on books to insure six weeks continuous operation, but prospects are that nothing can be produced before the first week in January, as coal cannot be obtained before that time under the best combination of circumstances. One producer is understood to be booking new business on the basis of 2.87c, Chicago, for first quarter while others are not willing to take anything further at present.

Mills producing hard bars from old rails are closed down on account of fuel shortage and in the face of heavy demand. Most mills are willing to accept contracts for delivery at convenience, with the price specified as that prevailing at the time of delivery. The last quotation on sales was 2.85c, Chicago.

Running Into Third Quarter

Philadelphia, Dec. 9.—Steel bar orders continue virtually to rain in on mills and in a good many cases latter have enough tonnage to run into third quarter of next year. Sales of round tonnages for first and second quarters have been made the past week at 3.50c, Pittsburgh, for commercial steel bars and at 3.75c for forging quality.

Shortage is More Acute

Pittsburgh, Dec. 9.—No relief yet is apparent from the shortage of merchant steel bars which has existed for several weeks; on the contrary, it is more acute than ever as production is feeling the effect of the coal scarcity and this spells a further backing up of live obligations of the manufacturers. The fact that the jobbers who entered the strike period with fairly large stocks of bars have become sold down to bare boards under the heavy demands of the past few months makes it extremely difficult for buyers to secure early tonnages at any price. Jobbers as well as the larger users of bars are making frequent inquiries for supplies but their demands are getting almost no attention regardless of price. An inquiry for 10,000 tons of bars from a Pittsburgh district maker of cold-finished steel is current but is getting no more attention than some of the smaller lots. The Carnegie Steel Co. continues to quote 2.35c base Pittsburgh, and is taking business at that figure although from the condition of its order books, deliveries hardly can be made against new bookings before the second quarter of 1920. Few of the independent companies would consider business at less than 2.50c and offers of 2.75c from buyers recently have been numerous. Illustrative of the tight situation in bars, a Detroit automobile manufacturer recently called for 2500 tons rolled from shell billets at a price of 3.50c, base Pittsburgh. Makers of iron bars are heavily sold up and while no change has been made in prices there are intimations of a further advance. Much business in iron bars is being turned away.

Business Still Backing Up

Pittsburgh, Dec. 9.—Due to the coal scarcity, production of merchant steel bars here is not making much headway and lacking supplies, the makers of cold-finished steel bars dependent upon outside sources are not able to increase operations or to materially reduce their obligations. Actually there has been a further backing up of business, especially in the smaller sizes of rounds and squares in which the scarcity of merchant bars is most acute. While the steel strike virtually is over, the coal strike looms up as a fresh restrictive influence. Makers still are quoting a base of 3.60c, Pittsburgh, for cold-finished bars although some sales have been made to manufacturers at warehouse quotations who ordinarily have enjoyed the jobbers' price.

Buying 1920 Bolts

Chicago, Dec. 9.—Production of bolts and nuts is somewhat uncertain under present fuel conditions as this industry is not regarded as essential and many producers are unable to operate their plants because of inability to obtain power. Demand is heavy and as this is the season when contracts for first quarter usually are made, the volume of business offered is unusually heavy. Makers expect to be able to care for the requirements of their regular trade, but have not figured on inquiries from outsiders. Prices prevailing are those which have been in effect for the past month.

Still Turning Away Business

Pittsburgh, Dec. 9.—Makers of nuts and bolts in this district have so much business before them and are having so much difficulty securing early shipments of bars that they are unable to give any attention to new demands and in fact, are turning away a large number of orders. The situation in rivets is not quite so acute but because of the raw material situation the Pittsburgh district makers are not taking business at less than 4.15c for structural rivets and 4.25c for boiler rivets.

Premiums are Obtainable

Pittsburgh, Dec. 9.—While makers of hoops and bands generally are holding to the old base of 3.05c, base, Pittsburgh, on both products and the Carnegie Steel Co. is taking business at that figure, it is stated that buyers willingly would pay 4.05c, Pittsburgh, to secure early tonnages. Makers are heavily committed, especially on bands, on which manufacturers of automobile accessories ordered freely some time ago. Pressure for delivery against these contracts is heavy, but buyers still are getting only a portion of their commitments, for even before the coal strike began to restrict production, new business was running ahead of output.

More Rails Are Sought

Chicago, Dec. 9.—While none of the contracts for standard steel rails now under negotiation has been definitely closed, due to the difficulty of determining whether the railroads themselves or the railroad administration will be charged with buying for 1920 delivery, the tonnage for western roads under consideration is growing steadily and now involves about 400,000 tons. Some of the contracts have been carried to a point of completion, requiring only a final signing and mills regard them as binding on themselves, realizing that the railroads cannot commit themselves definitely under present circumstances. Demand for light rails is strong and until the last few days tonnages were being booked for both export and domestic use. No inquiries for cars are being put out at present, but an inquiry has been received recently for 3000 tons of steel, largely plates, for repair work by a carbuilder.

Mills Fairly Busy

Pittsburgh, Dec. 9.—Makers of standard rails have a fair amount of business before them although recent orders have been entirely in small lots. Just when orders for the rails for which the Pennsylvania railroad recently entered reservations will be placed is considered problematical. There seems to be an impression, however, that even though the railroads now under governmental direction go back to private management on Jan. 1 it will be some time thereafter before the question of finances will be ironed out and few are looking for the

orders until well after the turn of the year. Not much is going on in splice bars nor in track bolts at present and inquiries for standard spikes are merely for the purpose of locating supplies. Although standard spikes still are quoted at 3.35c, Pittsburgh, small spikes have moved up further.

Form Sand Company

Youngstown interests have formed the Youngstown Silica Sand and Sand Products Co., capitalized at $200,000, for the purpose of developing the company's holdings of 114 acres situated about four miles south of Mercer, Pa. A recent survey of the company's deposit indicates that the silica rock formation is about 90 feet deep and extends over 50 acres. In addition, the holdings include molding sand, gravel and building sand. A plant, having a capacity for crushing 500 tons of silica rock per day, is to be built soon. The directors of the company include G. E. Burke, R. C. Krause, R. E. Holway, F. M. Van Esbeck, R. T. Miller and J. R. Riley. Offices are located at 909 Home Savings & Loan building, Youngstown.

Japan Buys Tank Plates

Placed 12,000 Tons at Pittsburgh at 2.65c—Sell in East at 2.75c—Shipbuilders Still Get 2.50c From Some Mills

Pittsburgh, Dec. 9.—Huge demands are being made upon platemakers in this district from the builders of tanks who are heavily crowded with business, both foreign and domestic. The Treadwell Construction Co., Midland, Pa., recently booked 60 tanks for export to Japan, each calling for 200 tons of plates. It is understood this business was placed at the full market price of 2.65c, Pittsburgh. Another order for 10,000 tons of tank plates also was placed here at that price. Not much business is coming out in ship or car plates but the mills are well filled up and one maker is not quoting against new inquiries for the present because of the possibility of being obliged to shut down on account of the coal scarcity and also because this manufacturer wants to keep up operations in those products where the backlog of business is heaviest, with an idea of reducing the obligations.

Much Tonnage is Refused

Philadelphia, Dec. 9.—Plate orders continue at a brisk pace and eastern mills, due to full boks, are turning away more tonnage than they are accepting. The minimum price for eastern mills continues 2.75c, Pittsburgh, at which figure sales have been made for first quarter. Some shipbuilding tonnage is being taken occasionally at 2.50c, Pittsburgh, by mills making a special drive for this work. Export orders continue in most cases to be refused.

Sells Tonnage at 2.75c

Youngstown, O., Dec. 9.—Increased demand for plates is coming out in this district. Approximately 2000 tons of tank stock were sold last week at 2.75c, Pittsburgh. Plate mills here are well booked and indications are that before the end of the year, little tonnage will be available for first quarter distribution.

Could Sell More Plates

Chicago, Dec. 9.—While demand for steel plates has been heavy during the past several months, producing capacity of this form of steel has been enlarged so materially that mills are able to care for a tremendous tonnage, and recent demand has not been sufficient to take the entire output to the extent that has obained in some other products. However, under present conditions of fuel supply, mills now are not willing to book further tonnage until they are able to estimate their remaining production for the first half of 1920. After the situation clears, it is assumed the inquiries for this material can be given consideration. The leading interest recently closed 7000 tons of ship material, mostly plates, for tankers to be built by a Pacific coast yard. An inquiry is current for 3000 tons of steel, mostly plates, for car work.

English Ferro Withdrawn

New York, Dec. 8.—Sales of ferromanganese made by interests in this district during the past week total 4000 to 5000 tons, and probably more. At least 2000 tons involved English metal guaranteed to contain 76 per cent or more of manganese, for shipment over the first quarter. This English metal was sold at $110, c.i.f. tidewater, and since these sales, further offers have been withdrawn. The remainder of the tonnage sold included domestic 78 to 82 per cent metal which went at $120, delivered. There is considerable inquiry still before the trade. The impression prevails generally in the ferromanganese trade that liquidation of the large stocks held earlier in the year has been thorough, and that there now is an under-production. The advancing trend in spiegeleisen prices became more pronounced during the past week, and the minimum price quoted has been $38, furnace, for 20 per cent metal. Sales aggregating more than 1000 tons have been made both at this figure and at $39, furnace, and some business has been done at $40, furnace. A fair amount of domestic business is pending. No action yet has developed on the large foreign inquiries reported a week ago.

A fair inquiry has been in the market for 50 per cent ferrosilicon for first half, but the tendency to close has not been very broad. Bethlehem Steel Co. contracted for 1000 tons. The market shows little change, quotations ranging from $80 to $85 a ton, delivered, with business reported at $82 to $83. Demand for 75 per cent ferrosilicon remains light.

Competition remains rather keen among domestic sellers in ferrochrome for next year's delivery. Quotations are unchanged at 27 to 29 cents a pound contained for alloy containing 6 to 8 per cent carbon. Chrome ore supplies are scarce and importers are slow in contracting for futures owing to high and uncertain ocean freight rates. A few hundred tons of spot New Caledonian ore recently was sold at $1 a unit

Some Sales of English Ferro

Pittsburgh, Dec. 8.—While a number of small-lot sales of domestic 80 per cent ferrosilicon have been made in this district recently, the largest transaction reported is in English material running 76 to 80 per cent. The latter sale involved 1000 tons for February-March delivery and carries a price of $110 c.i.f. Baltimore. This order was taken subject to ability of the producer to deliver as specified. All sales of domestic metal have been at $120 furnace, freight allowed, for 80 per cent with the transactions running 50 or 100 tons and usually for prompt shipment. Not much has been doing in spiegeleisen lately.

Demand for 50 per cent ferrosilicon has dwindled to small proportions and while occasional small sales are being made at $85 furnace, freight allowed, the bulk of the business is believed to have been below that figure as some sellers who quoted it have not obtained the orders. Ending of the strike at Jackson, O., furnaces has been accompanied by a revision upward of prices of bessemer ferrosilicon produced at these stacks. A basis of $59.50, furnace, for 10 per cent now is quoted by all makers in that district although none of them yet has resumed operations. It is understood some consumers have heavy stocks purchased during the closing months of the war and makers have substantial supplies on their yards against which shipping instructions are coming forward slowly.

Chain Prices Down

Pittsburgh, Dec. 9.—Prices of steel chain show marked firmness, due to the fact that makers are heavily sold up and are unable to secure supplies of merchant bars for early shipment except at substantial premiums over the old base price. Much business is piling up as production is interfered with through the scarcity of raw material and shipments naturally are falling behind the orders. Pound chain is unchanged on a base of 5.75c, Pittsburgh, for 1-inch proof coil and the recent advance in steel loading chain resulting from an adjustment in the wage scale for making this class is firmly maintained. The advance in this class of chain was 6 cents a pound in ¼-inch, 5½ cents in $\frac{3}{32}$-inch, 4½ cents in $\frac{5}{16}$-inch, 1 cent in ⅜-inch, 2½ cents in $\frac{7}{16}$-inch, 2 cents in ½-inch and ½ cent in ⅝-inch.

Early Shapes Are Scarce

Fabricators Obliged to Draw on Warehouses—Awards Numerous But Not Heavy—Smelter For India is Placed

Pittsburgh, Dec. 9.—Shape mills in this district are falling behind in their deliveries against orders for strutural shapes and because of this situation some of the fabricating interests have been obliged to draw upon warehouse stocks in the meeting of their obligations. Such purchases mean payment of $15 a ton over the mill base. The position of the mills as far as small shapes are concerned is even tighter than in the larger lines and delivery against current bookings are not being promised before the first of February, and even later. This condition in part is due to the fact that small shapes are rolled on bar mills and in the desire to reduce the backed-up tonnage of merchant bars, manufacturers are not devoting much capacity to the rolling of the smaller shapes. No trouble would be had in making sales of the latter for prompt delivery at substantially above the regular market base of 2.45c, Pittsburgh, but as a general rule this quotation is being generally observed.

New England Demand Steady

Boston, Dec. 8.—The demand for structural steel throughout New England, contrary to the usual tendency at this time of the year, is holding firm. Inquiry is strong for 1920 delivery and actual orders for prompt delivery continue to be placed in favorable numbers. The contracts awarded during the week, although in most cases small, included many buildings of steel construction. A storehouse let for construction in Boston will take 300 tons of steel. Warehouse supplies of structural shapes are holding up better than other grades.

India Smelter Takes Tonnage

New York, Dec. 8.—Although large tonnages are lacking, there is a fairly good sprinkling of orders in the eastern structural market. The largest contract of the week to be made tentatively called for 3500 tons for a zinc smelter at Janshedpur, India. A number of other fair sized awards were made. While new inquiry was light, there continues to be considerable tonnage pending, and fabricators are confident that the great bulk of this business will be placed. Another lot expected to be let most any day involves 800 tons for the Biltmore Country club, Rye, N. Y. Action on the Newtown high school in Brooklyn, requiring about 800 tons, has been postponed indefinitely. Owing to belated mill shipments, eastern fabricators are not accepting business for delivery much under three to four months. Were it not for the delay in getting material from the mills, the majority of eastern fabricating shops could handle orders in eight and nine weeks, it is asserted.

Orders Exceed Shipments

Philadelphia, Dec. 9.—Shape orders, while mostly small, form a steady stream and eastern mills are adding new tonnage faster than they can ship. Several important lots were placed the past week. A Japanese interest bought several thousand tons from an eastern mill and a Pittsburgh mill which is making a special drive for ships tonnage, took a big lot of ship shapes for Baltimore yard at 2.40c, Pittsburgh. The minimum figure at present with one eastern maker on new tonnage now is 2.75c, mill.

Most Tonnages Small

Chicago, Dec. 9.—Construction work in the west at present is confined to small tonnages, the largest project closed recently involving 660 tons for three buildings for the American Steel Foundries at Detroit. The Hotel Sherman Co. is inquiring for 600 tons for additional stories on its hotel at Chicago. The inquiry for 400 tons for a Y. M. C. A. building at Columbus, O., has been withdrawn, as has the inquiry for 200 tons for trusses for the Drake hotel at Chicago. Plain material continues unchanged at 2.72c, Chicago.

CONTRACTS AWARDED

Theater building, Baltimore, 1100 tons, to the Harris Structural Steel Co.

Zinc smelter at Janshedpur, India, 3500 tons, placed tentatively with United States Steel Products Co by Lawrence Addicks, consulting engineer, 6 Church street, New York City.

Building for Standard Guano Co., Baltimore, 800 tons, to the Shoemaker-Satterthwait Bridge Co.

Building for Hartford Times, Hartford, Conn., 260 tons, to Levering & Garrigues.

Plant addition for American Chain Co., York, Pa., 250 tons, to independent shop.

Building for Southern New England Telephone Co., Hartford, Conn., 300 tons, to the American Bridge Co.

Addition to Bush Terminal office building, New York, 650 tons, to the American Bridge Co.

Public school No. 43, New York City, 190 tons, to the Phoenix Bridge Co.

Plant addition for Stevens-Duryea Co., New York, 660 tons, to the Phoenix Bridge Co.

Factory buildings for Berlin Construction Co., Berlin, Conn., 1130 tons, to the Phoenix Bridge Co.

Extension to mill for Inland Steel Co., Chicago, 1200 tons to Worden-Allen Co.

Foundry and core-room addition for Janesville Machine Co., Janesville, Wis., 100 tons to Worden-Allen Co.

Extension to power house of the Goodyear Rubber Co., Akron, O., 400 tons to the McClintic-Marshall Co.

Factory building for the Gear Grinding & Machine Co., Hamtramck, Mich., 250 tons to the McClintic-Marshall Co.

Factory building on Waldon Ave., Buffalo, 250 tons to the Jones & Laughlin Steel Co.

Buildings A, B, and C at Detroit, for the American Steel Foundries, 600 tons, to Whitehead and Kales Co., Detroit.

Foundry building for the Buda Co., Harvey, Ill., 236 tons, to Worden-Allen Co.

Steel for waste heat boiler room at the plant, for the Marquette Cement Mfg. Co., La Salle, Ill., 126 tons, to Federal Bridge Co.

Addition to building for Albert Pick & Co., Chicago, 120 tons.

Sanitarium building, for the Daily News Fresh Air Fund, at Lincoln Park, Chicago, 115 tons, to American Bridge Co.

CONTRACTS PENDING

Biltmore Country club, Rye, N. Y., 800 tons, award expected soon. Geo. A. Fuller Co., general contractors.

Newton high school, Brooklyn, 800 tons, postponed indefinitely.

Additional stories on its hotel for the Sherman Hotel Co., Chicago, 600 tons, bids asked.

*Future shipment from Singapore or London.
†American Smelting & Refining Co.'s price.
‡Open market.

NEW YORK, Dec. 9.—Higher prices for lead, zinc and tin have been recorded in the American markets the past week, due to advances abroad. Broad export inquiry has been reported, particularly for lead and zinc. Great Britain has been in the market for large tonnages of zinc, also lead; France for zinc and copper; Japan for zinc, lead and copper; Scandinavian countries for lead. Domestic demand, on the other hand, has been held back by the shortage of fuel. Some important consumers have been forced to close down, including many automobile plants. The American Sheet & Tin Plate Co., Gary plant, which consumes large tonnages of zinc and tin, is closed, and shutdown of some of the company's other works was threatened. The Chicago plant of the National Lead Co. was reported closed. The Anaconda Copper Mining Co. closed its Montana copper mines and smelter, and refinery and operations of its other Montana properties were threatened. Many other smelters and refiners have only small supplies of fuel and if the fuel shortage is protracted production will be much further protracted.

The copper market appears to have reached bottom at 18c, as a vastly improved demand has appeared since the market reached that level. Business was done in electrolytic copper for first quarter delivery the past week at 18c, but more recently consumers bid 18.25c, and today the market was 18.50c to 18.62½c. The producers seem to have determined to keep the reins of the market and have been trying to keep out the speculative element. Second hands have bid as high as 19.50c for copper for March delivery, when consumers were offered metal for that position at 18.25c. Casting copper is scarce at 18.12½c to 18.25c; lake is nominally quoted at 18.75c to 19c.

Prime western zinc advanced further under the leadership of the London market, despite falling exchange. Sales for export were aided by the London market. East St. Louis market advanced about 25 points from Dec. 1 to Dec. 8, to 8.40c, for prompt and first quarter shipment. High grade zinc was quoted 9c to 9.12½c, delivered, Dec. 8.

The American Smelting & Refining Co. advanced its lead price to 6.90c, New York; 6.65c, East St. Louis. Slightly higher prices prevail in the outside market. The American lead market is being forced upward against the judgment of the producers, by the rise abroad, due to curtailed world supplies.

The tin market, after declining to a low point of 53.25c last week, for Straits tin, spot New York, responded to a sharp rise in London and advanced to 54.50c to 55c on Monday, but today was 54.25c to 54.50c. The first named prices also applied to futures, which were steady today. Spot 99 per cent was available about half a cent below Straits. Demand has been light, owing to recent heavy deliveries and reluctance of consumers to buy ahead during the present coal shortage.

Antimony advanced a quarter cent to 9.50c for both spot and futures. Business was done at this price. Aluminum and nickel are steady.

Semifinished Is Higher

Scant Tonnage Open to Sale Makes Market Indefinite—Sheet Bars Bring $50—Slab Bids of $50 Declined

Pittsburgh, Dec. 9.—Not much trouble is experienced in the sale of either billets or sheet bars at substantial premiums over the March 21 quotations when any tonnages are available for the open market. This occurs, however, only occasionally and usually as a result of an uneven distribution of finishing mill activities. Small tonnages of 4 x 4 billets occasionally reach the market and have found ready sale from $43 to $45. While considerable tonnage still is moving to consumers at the old base of $38.50 on contract, such tonnages as are offered on the market bring $43 to $45 frequently enough to make this the quotable range. A sale of 1000 tons of sheet bars which became available because an original buyer could not use them, is noted at $50 and it is doubtful if other tonnage could be bought for less than $48. In fact, business has been done at both $48 and $50 recently and the current market on the small prompt tonnages available is quotable at these figures. It is reported that wire rods have gone as high as $65 on recent sales.

Billets and Slabs Higher

Philadelphia, Dec. 9.—More than 5000 rerolling billets were sold in this district the past week at $54, delivered, or $50, Pittsburgh, and some slab tonnage was sold by adding a differential of $2.50. More than 1000 tons of forging billets were sold at $60, Pittsburgh, or $64, delivered eastern Pennsylvania. There is inquiry for semifinished material for Europe but it does not appear active.

Higher Prices Are Paid

Youngstown, O., Dec. 9.—Semifinished material is scarce in this district and is becoming more so steadily. A tendency toward higher prices prevails. One lot of 1500 tons of slabs and another of 300 tons, brought $48, mill, last week. Sheet bars practically have disappeared from the market. If they could be had, it is believed a quotation of $48 would about represent the market. A recent inquiry put out by one valley consumer brought several quotations ranging from $47 to $51.

Offer $50 for Slabs

Cleveland, Dec. 9.—Producers of semifinished material in this district have been offered $50 for open-hearth slabs but have declined to accept the business because they are unable to offer any tonnage at present in view of their contract obligations. Semifinished material continues exceedingly scarce and various buyers who would take on tonnage are willing to pay higher prices.

Wants Strip Tonnage

Pittsburgh, Dec. 9.—Some makers of strip steel who opened their books for first quarter 1920 business, already are booked to capacity. Those who have not been taking new business have obligations accruing from the strike interruption to keep them engaged during the first three months of the year. Huge inquiries are pouring out for early tonnages, particularly of hot-rolled, while a Detroit automobile company is seeking to place approximately 100,000 tons of cold-rolled strip steel for delivery in equal monthly tonnages over the whole of next year. This steel is wanted for brake bands. Tendency of buyers to overbuy as a measure of protection against possible shortages next year has led some manufacturers to limit orders for the first quarter to the same tonnages placed by the individual buyer for the present quarter. Much business is being turned away by makers at present because of their lack of tonnages over and above contract obligations.

More Advances

In Cast Iron Pipe—Large Tonnages Are Pending in Chicago

New York, Dec. 8.—With pig iron advancing rapidly and private demand coming out in heavy volume, cast iron pipe in the East has gone up $4 a ton. Class B pipe 6-inch and over now is holding at $62.30, New York, and 4-inch at $65.30. Class A pipe is quoted $2 higher. An advance has been expected for several weeks. Owing to heavy private buying, deliveries on 6, 8 and 10-inch pipe can not be had before eight weeks, and at least in one or two instances before 12 weeks. Shipments on some of the larger sizes, such as 24-inch pipe, are scarcely available before a month. Bids have been closed on 2000 tons for New York City. John Fox & Co. were low bidders. Other than this there is little public demand.

Large Tonnage Pending

Chicago, Dec. 9.—Although bids were opened several days ago at Elyria, O., on 5000 to 7000 tons of cast iron pipe, no award has been made as those in authority have been unable to agree on their course. Bids will be opened Dec. 15 at Sandusky, O., on a small lot. Aside from these lots the market affords little prospect of business, aside from routine and contractors' orders which have been coming in sufficient volume to give shops good operations.

Pipe Mills Also Affected

Pittsburgh, Dec. 9.—The coal shortage is doing something which the strike of the steel plant workmen failed to do and that is to restrict appreciably the production of the National Tube Co. This company still has in operation all of its plants, except the Riverside works at Benwood, W. Va., which has been down since the first day of the steel strike, but coal supplies are so short that it has been necessary to restrict production to the lines in most urgent request and where the orders are heaviest in order to prolong the fuel and also plant operations. The production situation is getting bad in tubular goods, for the lack of coal is holding in check the operation of the Youngstown, O., plants, while Pittsburgh independent plants are going along at a reduced rate and in the Wheeling district all steel plants, it is believed now could be operated if coal were plenty. Marketwise the situation is as it has been for some time past, with big demands coming out for oil well and line pipe and business again backing up because of the inability of makers to bring production to a point in keeping with the requirements.

Another Advance in South

Birmingham, Ala., Dec. 9.—Demand for cast iron pipe continues strong in the South and some makers are withdrawing from the open market. Another advance in prices has been made, 4-inch now being quoted at $59 and the 6-inch and over at $56.

Jobbers Advance

Higher Prices Shown at Boston, Cleveland and New York

Boston, Dec. 8.—With climbing pig iron, coke, and scrap markets, and the continued difficulty in obtaining deliveries, warehousemen in Boston have made advances effective this week. Warehouse prices in most cities in New England have advanced at different times ever since the steel strike was called, but the larger Boston houses have, until the last few weeks, doggedly stuck to the old schedule. Recently this uniform schedule has been broken up and today it is hard to give the going market value of any one warehouse grade. One of the largest Boston interests this morning announced the following advanced schedule: Steel bars, 4.00c; iron bars, 4.10c; shapes, 4.00c; plates, 3.95c; No. 10 blue annealed sheets, 5.30c; No. 28 black sheets, 7.65c; No. 28 galvanized sheets, 9.00c; bands, 5.20c; hoops, 5.45c. The demand in all lines except plates continues unusually active.

Prices Show Range

New York, Dec. 8.—A wide range of prices characterizes the local warehouse market in sheets and steel bars. On the latter, one large interest is quoting 3.37c, New York, another 3.52c, and still others 3.62c. In sheets the divergence in prices is more marked. No. 10 blue annealed is quoted from 4.82c to 6.00c; No. 28 black sheets from 6.00c to 7.50c; and No. 28 galvanized sheets from 7.25c to 9.50c.

Some Cleveland Jobbers Advance

Cleveland, Dec. 10.—Flat increases of $5 a ton on all warehouse stocks of steel have been put into effect here by certain jobbers. This brings the quotations to 3.52c on steel bars, 3.62c on structural shape, 3.82c on plates, 4.72c on No. 10 blue annealed, 5.52c on No. 28 black and 6.87c on No. 28 galvanized sheets.

Material Shortage Slows Exports

Japan a Heavy Buyer of Tin Plate and Railway Material — Oriental Demand For Pipe is Larger—Delayed Deliveries are Diverting Inquiries to England — Chile Purchases 18,000 Tons of Rails

NEW YORK, Dec. 8.—Buying for export daily becomes more difficult. While considerable material has been sold during the past week the outlook is not bright. A number of the well established houses complain that they are finding it difficult to place orders with mills, not only because of labor deficiencies but also because of coal shortage. So long as this situation obtains the mills hesitate to book future business. The demand from abroad continues to be active, however, and some sales constantly are being made to the Orient and South America. This is a sellers' market exclusively and practically any material offered finds a ready taker at prices far above the former schedule.

The big agencies are attempting to keep prices down, and they have informed purchasers that the 1919 schedule is going to prevail during 1920. But when an effort is made to buy from them they declare they have no material to quote on. This has thrown the market into the hands of the independent and the small producers, the warehousemen and the jobbers who are less considerate about the price level. Japan, the largest buyer today, is beginning to show a hesitancy in placing contracts.

This desire of the Japanese to have steel shipped before March 1, 1920, is believed to be prompted by the fact that they are convinced freight rates in this country will be advanced at that time and such a change materially would raise the price of the material delivered. Furthermore, it was explained by one Japanese purchaser, if material is to be contracted for on the basis of future delivery they may as well place their requirements with England. Taking into consideration the rate of exchange, supplies can be purchased in England at prices approximately those prevailing here. The chief drawback to buying from England heretofore has been the long delay in deliveries.

Unprecedented Tin Demand

One of the recent Japanese inquiries was for 10,000 boxes of tin plate. The Japanese expressed a willingness to pay $8.50 c.i.f. but the quotation was far beyond this. One American jobber offered to fill the order at approximately $10 c.i.f. The offer was refused. One house reported it has sold Japan within the past week or so a total of 21,500 boxes of tin plate. The sales ranged from 1000 to 5000 boxes each. The price on this business varied from $7.50 to $7.60 per base box, Pittsburgh. The Japanese have been taking all the tin plate they could find. It was estimated by one exporter that the Japanese inquiries for tin plate today total 40,000 boxes.

There has also been an extremely active demand from Japan for bessemer black plates for tinning. The specifications named on most of the inquiries are 30 Birmingham gage, 36 x 72 inches. It is practically impossible to obtain the material. According to well authenticated reports the United States Steel Corp. refused to consider an inquiry for 20,000 tons. The failure to place any of this business is not due to high prices but more particularly to the inability to find a mill which is willing to sell or to accept a contract for reasonable future delivery.

A number of small sales of other material to Japan have been reported. A new export house has just closed for 1700 tons of bars. A Japanese order for 3000 kegs of nails also was taken at an advanced price. A new inquiry is out for 7000 tons of plates and sections for shipbuilding. Japan also inquired for 300 tons of light rails, and was quoted an advance of $7. The quotation was rejected. Japan has been buying heavily for the Manchurian lines. A sale of 800 freight cars of 60,000 pounds capacity to Manchuria is in prospect.

The trade of China is somewhat different from that of Japan. China depends upon silver to make her balances and the only large nation of the world having a fair stock of silver is the United States. As a consequence American companies have been able to initiate avenues of trade by purchasing Chinese goods and paying cash therefor. The English trading houses, nevertheless, have branches all over China and they are holding on strongly. Among the Chinese sales during the past week were 600 tons of mild steel plates at 2.75c, Pittsburgh base. This sale was made through a British agency. The current Oriental purchases consist of pipe, bars, sheets and galvanized goods. One of the largest inquiries calls for 6,000,000 feet of pipe for deliveries to start in April and extend over 15 months.

India purchased 800 feet of pipe at a price said to be 43 per cent under the English list. Australia took 400 tons of mild steel plates at 2.75c. Pittsburgh. A small Australian order for bars was also placed at 3.20c f.a.s. Canadian mills are reported to be pushing the American producers close for some of this business.

A number of American builders have closed for some 20 marine engine units to be shipped to Manila. The deal was handled for the Yangco Shipbuilding Co. of the Philippines by Ambrosia Magsagsay, general manager for the company, which proposes to go into ship construction at Manila on a big scale.

Some of the American export business would not have been placed had it not been for the offices of certain British houses which are making every effort to hold their customers in world markets. An American mill has contracted to deliver to England 4500 tons of sheet bars. England also has purchased 8000 tons of billets. One house reported that it had sold England between 15,000 and 20,000 tons of plates during the past 30 days. The price was equal to the domestic. It is learned a very large English order for pig iron is pending.

Rail Sales Are Features

Resumption of production in Belgium apparently increases the wants of that country. Investigators report an insistent and growing demand for materials for lining the pits of coal mines, as well as cables, beams, and machinery of all sorts, also high resistance galvanized steel wire for cable manufacture.

It was reported last week that the Submarine Boat Corp. has sold to Italy four "unassembled" ships.

South American business largely comes in dribbles. The United States Steel Products Co., is reported, however, to have accepted an order from Chile for 12,000 tons of rails. A minor house sold Chile 6000 tons of rails.

Advance Steel Prices in Britain

Increases Affect Semifinished Material and Small Finished Products — Molders Strike Continues 100,000 Being Idle—Steelmakers' Stocks of Steel Mount to New Record Because of Car Shortage

Weekly Iron Trade Review Staff Cable

European Headquarters,
THE IRON TRADE REVIEW,
16 Regent St., S. W. I.,
London, Dec. 8.

PRICE increases feature the British iron and steel market. This especially applies to semifinished material and to small finished iron and steel products. Iron skelp has been advanced to 24s, steel skelp to £25 10s, and hoops to £25 10s. Billets and sheet bars are up from 5 to 10 shillings. Middleboro No. 3 is higher. Puddling rates have been advanced 7½ per cent and other iron works averages 5 per cent. The supply of coal has improved but still is below the normal rate. The November output will approximate 19,000,000 tons. Railroad car shortage remains the big factor. Stocks of steel at Middleboro works have reached large proportions and in fact are the greatest ever known.

The demand for pig iron is excellent. A few furnaces which have been idle are resuming.

The idleness of many plants caused by the molders' strike may terminate next week. Negotiations which were scheduled for last week failed because the men still are unwilling to accept arbitration, proposing an increase of 5 shillings per week. In the meantime the stoppage of plant operations has reached an alarming stage. Manufacturers of automobiles, machinery, locomotives, marine engines, cast rolls and rolling mill machinery are especially hard hit. Many plants are being forced to close. The total unemployment is now well over 100,000.

Office of THE IRON TRADE REVIEW,
Prince's Chambers, Corporation St.,
Birmingham, Eng., Nov. 21.

Rate of Exchange—4.01½

KEEN buying, which is typical of the last two months of the year, is now in full swing. Pig iron prices are firm, and would be increased but the for the safeguarding clause which commits the buyer to responsibility for any addition to railway rates. This clause is insisted upon, whether for raw or finished material. The state of suspense covers not only railway rates, which most people expect will be put up 50 per cent, but also includes coal which should be reduced if ministers carry out their promises. The iron and steel trades are so strongly interested in both matters that it is hoped that both changes will be declared at once. When the declarations are made, it will be possible to rearrange prices generally.

It is quite possible that the iron trade will fail to get under the coal reduction any real compensating advantage for the sacrifices it must make under the head of railway rates. Coke makers are much dissatisfied with their prices, although they have reached unprecedented heights. The makers of the best coke, in particular, are very bitter because, under the cast iron system of coal control, they are unable to charge more than the makers of fuel admittedly inferior. Then, since the prices were fixed various additions to the cost of production have been made under the head of labor and materials. The coke makers hope to satisfy the coal controller that no equivalent reduction in coke ought to take place if and when coal is reduced.

The great scarcity of basic material may lead to the resumption of imports from America if sources of supply can be found.

The production of pig iron generally is insufficient, but the principal difficulty is with foundry and best iron generally, so many circumstances are keeping down the quality. The effect of this is some little shading of prices of forge iron in Cleveland, where supplies are fairly plentiful. The Cleveland market suffers very severely in its foreign business from exchange difficulties, which restrict buying by Italy, Belgium and France to the barest necessities. Enormous difficulties arise from the insufficiency of transport. Railway wagons are unobtainable and the molders' strike has placed a great obstacle in the way of engine repairs, and may eventually cause extensive stoppages on certain sections. Output is restricted enormously by the combined effect of wagon and coal shortages. Although the molders' strike continues, iron foundries are buying keenly. The only cheerful feature of the iron molders' strike is that the workmen are seeking to reopen negotiations. This is an entirely new attitude, indicating that the men are feeling the pinch. On the other hand, the Scotch iron molders are proposing to strike tomorrow, and this will greatly aggravate the position as some English mills have been renewed and repaired with castings obtained in Scotland.

Owing to the comparatively low production of steel, the conditions of west coast hematite, and to some extent the east coast, is much less serious. Everything points to a huge demand for pig iron when the iron molders' strike is settled.

Demand is strengthening in all departments of iron and steel. The activity in the finished iron trade is very great. There is not an ironmaster in South Staffordshire who has not within the past week or two, re-

fused orders, chiefly foreign, running into thousands of tons. These cover all branches, sheets, bars, hoops, material for reinforced concrete and sections. The mills are quite unable to cope with them, but there are very good reasons why they show a decided preference for home business.

Transport difficulties are so serious that many mills in the Black country, whose order books are loaded up, have their warehouses so full of finished material that a stoppage is inevitable in some cases until the mills are clear.

The scarcity of half-finished steel approaches famine proportions. Several mills near Birmingham are idle, or nearly so. One of the largest has not operated at more than 30 per cent of its capacity for two months. The country has been scoured for billets with very little success. A few Scotch parcels have been had at high prices. Welsh material cannot be delivered before January or February when the Ebbw Vale works, the Dowlais steel works, and others, resume full production. American steel does not now come in in sufficient quantity to produce an appreciable effect. Some fairly good lots of American discard steel have been offered at low prices, but these have a very limited use for ordinary trade purposes.

Galvanized sheets are ordered in big lots, and very strong efforts are being made in Birmingham to start additional mills which, for months past, have been waiting for the requisite skilled labor. Sheets sell easily at £37 ($148.55) to £37 10s ($151.89) per ton.

Billets have been advanced from £15 5s ($61.22) to £16 (64.24) per ton, but are almost unobtainable at this price. Finished steel has not been formally advanced but easily realizes from 10s ($2.01) to £1 ($4.01) more per ton.

War Control of Coke Prices Restored

WASHINGTON, Dec. 9.—An order of Fuel Administrator Garfield last Saturday restoring war time prices of beehive and by-product coke made sharp reductions in the prevailing market quotations. While not entirely unexpected, the order canceling the suspension order of last January was somewhat of a surprise in that no inkling of its coming was to be had until it was announced at midnight Saturday. It terminated a week, however, given over to final study of the coke situation, the few days previous having seen an order promulgated curtailing the output of beehive coke 25 per cent, which, at the average rate of production in the past few weeks, amounts to considerably more than the mere percentage shows.

By the order of Saturday night beehive coke prices were restored to these levels: Connellsville, furnace, $6; Connellsville, foundry, $7; Connellsville, crushed, $7.30; and on by-product: Furnace, $5.70; foundry, $6.70; crushed and screened, $6.20. This restoration largely was made by the fuel administrator in order to keep prices to the public, not only of coke but of stel and other commodities, from going higher. This is an avowed policy of Fuel Administrator Garfield and one which the political administration is backing. According to reports reaching here it is generally accepted with open arms by the public.

In this connection the geological survey's weekly report, which show the coke output of the week ending Nov. 29 was 449,000 tons, the highest in any week since last February, except just before the beginning of the steel strike, has the following to say on coke production and prices:

"The causes underlying the exceptional output of coke have been apparent since the beginning of the coal strike. The beehive ovens for the most part lie in the regions not affected by the strike order. Open top car equipment has been released in abundance by the closing of the union mines. The competition of by-product coke has been for the time being restrained by the difficulty which by-product operators have experienced in obtaining supplies of coal. The fact that war time maximum prices have been restored on coal but not on coke (Editor's note: At time this statement was issued coke prices were not fixed) has encouraged operators to dispose of their product as coke rather than as coal. The consequence of these tendencies is seen in the increased proportion of the coal produced going into the manufacture of beehive coke. Whereas normally the beehive ovens take 6 per cent of the output, during the last week of November they absorbed 12.3 per cent of all the soft coal produced."

The Garfield order restoring war time prices and regulations on coke was as follows:

"The United States fuel administrator, acting under authority of an executive order of the President of the United States, dated Aug. 25, 1917, and of subsequent executive orders, and in furtherance of the purpose of said orders, and of the act of congress therein referred to and approved Aug. 10, 1917,

"Hereby orders and directs that the order of said administrator, dated Jan. 31, 1919, suspending the operation of certain rules, regulations, orders and proclamations theretofore promulgated by or under the authority of the President of the United States or by said administrator relating to coal and coke be and the same hereby is revoked insofar as said order suspends the orders and regulations of said administrator fixing or regulating the prices of beehive and by-product coke, or fixing or regulating the margins or commissions of middlemen or wholesale or retail dealers in beehive and by-product coke, and said orders and regulations are hereby restored to like effect as if the same had not been suspended, and said administrator

"Further orders and directs that all beehive and by-product coke in transit on or after date of this order shall be subject to diversion in like manner and to the same extent as bituminous coal under orders of said administrator relating to the diversion of bituminous coal in effect at the date of this order. The person or consumer to whom any such coke is diverted shall become liable as of the time of such diversion to pay to the shipper thereof the prices for such coke as fixed by or under the authority of the President of the United States and in effect at the date of such diversion, plus transportation charges thereon, and the order of said administrator dated Jan. 14, 1918, as amended by the order of said administrator dated Nov. 20, 1918, is hereby suspended insofar as said amended order is inconsistent with this order, and said administrator

"Hereby authorizes and empowers the director general of railroads and his representatives acting by and under his authority to make such diversion of coke in transit as may be necesary in the present emergency."

Wants Equipment

Friction clutches, one-way marine clutches, metal adjustable shaftlogs and propeller wheels for motor boats, will be manufactured by the E. J. List Mfg. Co., Havana, Ill., which was recently incorporated. The company does not plan to build a new plant, but is erecting an addition to its present building, and is in the market for screw lathes, drilling machines and grinding machines. The company, which is capitalized at $35,000, was incorporated by E. J. List, president; L. B. Travers, vice president; Fred C. Euteneuer, secretary-treasurer, and the office of the company is located on Water street, between Main and Adams streets, Havana, Ill.

Shells Require Uniform Castings

High-explosive Shellmaking Demands Consistent Ingots if the Percentage of Discards is to be Held to a Minimum—Forming Process Executed by Horizontal Hydraulic Press—Method Followed at Watertown Arsenal

BY HERBERT R. SIMONDS

PERHAPS the greatest necessity for uniform castings is found in the manufacture of high-explosive shells. Here are found many of the principal problems met by foundrymen, metallurgists and machinists. A detailed account of this manufacturing process is beyond the scope of this article but a general description of the methods employed at the Watertown arsenal, Watertown, Mass., in the production of 14-inch, high-explosive shells may serve to illustrate the attention which generally is given to uniform castings in shell manufacture.

The arsenal plant was established in 1816 and seven of the original buildings are still in use so that the entire progress of the metal working trade of this country is written on the annals and records of the institution. New buildings and modern equipment have kept the plant continually abreast of the times.

Ingots Carefully Designed

Ingots of the size required for 14-inch shells must be designed carefully to prevent the formation of cracks and pipes. The ingots used at the Watertown arsenal are corrugated and tapered along carefully predetermined lines to facilitate cooling and withdrawal from the mold. They are cast of special steel and their structure and analysis must meet the strict requirements of the foundry inspector. Each ingot as cast weighs 2800 pounds, which includes a 500-pound riser or hot top connected to the main ingot

FIG. 2—INGOTS ARE CAST WITH A 500-POUND RISER WHICH IS KNOCKED OFF PRIOR TO FORGING

by a bottle neck. Until recently these ingots were cast in one straight section, the riser being merely a uniform continuation of the ingot itself. The risers were then sawed off by a slow and costly process. The ingots, which now are molded with the bottle-neck joint between the riser and the ingot body, are placed on a two-point support. A weight is dropped on the joint, and breaks off the riser at one blow. This not only saves time and expense but presents a fracture across the top of the ingot for determining the structure of the metal.

Serial Number is Important

Before each ingot is cast a strip of metal, which is stamped with a number, is partially inserted into the mold. This number follows the ingot through the various operations and becomes the number of the completed shell.

Considerable importance is attached to this individual numbering of shells, and if for any reason a shell number is lost in its circuit through the different finishing processes, the shell is discarded, even though nearly completed. The number is painted in white figures on the side of the ingot, and later is die punched on the partially-finished shell. Thirty of the ingots are cast from one heat and these become a unit group in the shell production. Each group continues intact on the records and throughout all the operations until the shells are boxed for shipment. In fact the group significance does not disappear until the shells have been fired and the results noted. A careful chemical analysis of specimens taken from

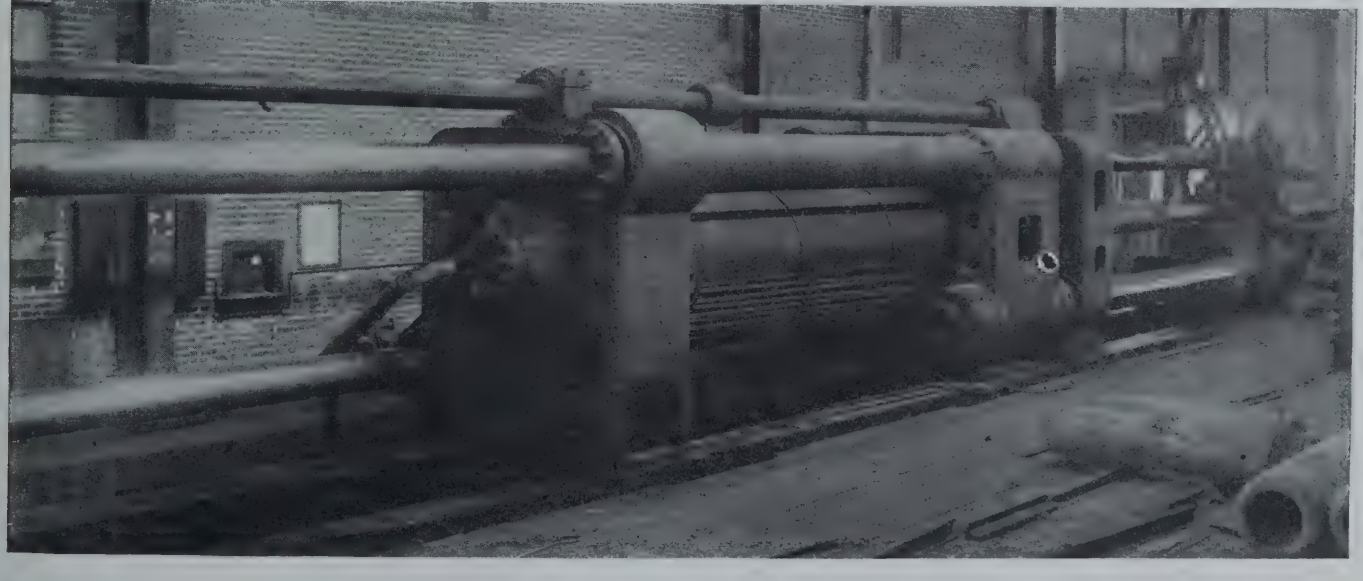

FIG. 1—HYDRAULIC PRESS, WHICH IS BUILT TO EXERT A TOTAL FORCE OF 2000 TONS, TRANSFORMS SOLID STEEL INGOTS INTO HOLLOW CYLINDRICAL SHELL FORMS IN ONE OPERATION

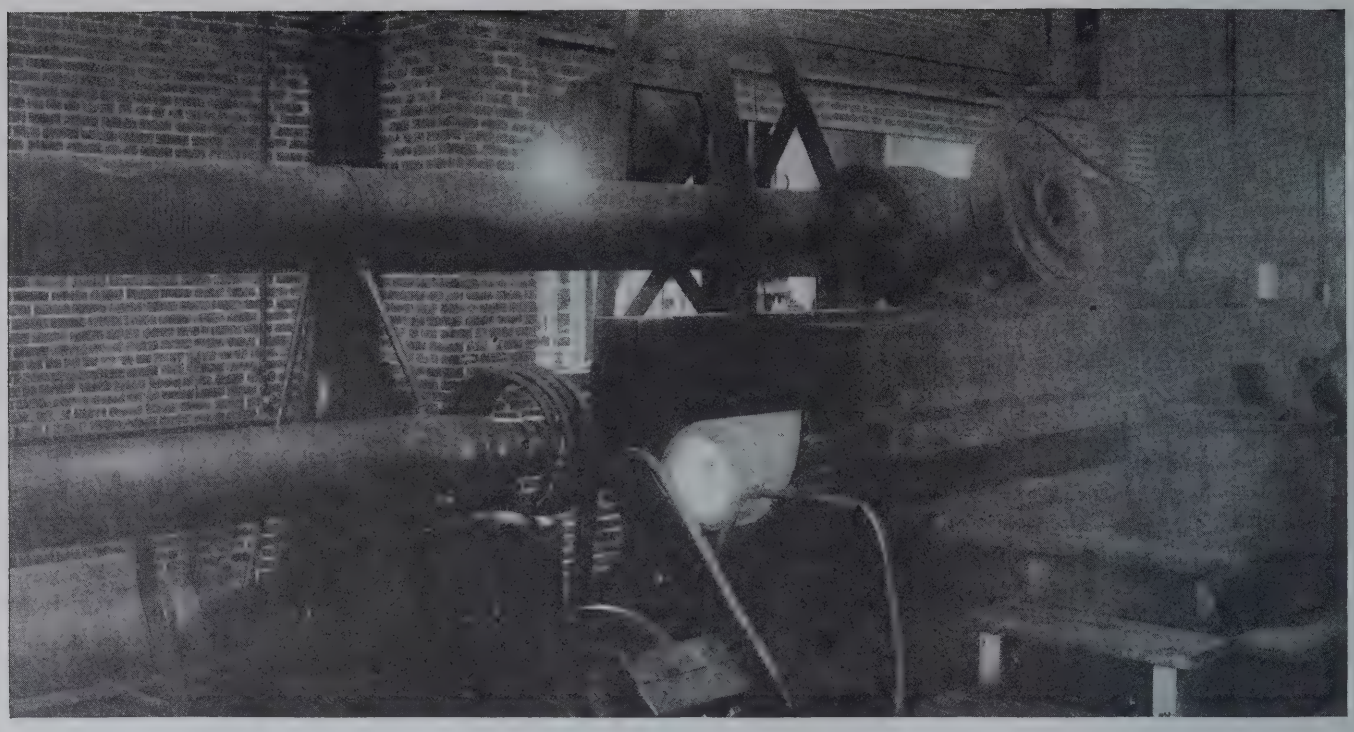

FIG. 3—A HOT FORGED INGOT AFTER IT HAS BEEN PRESSED AND EJECTED FROM THE PRESS CONTAINER. THE MANDREL IS SHOWN AT THE LEFT WHERE IT HAS BEEN WITHDRAWN THROUGH THE COOLING COIL

each heat in the foundry indicates the composition of the shells in each group, and this analysis therefore is an important part of the records of the shells as they pass from one department to another. The heat treating is based upon this composition, and the record and behavior of the completed shells is compared with the record of chemical analyses. In this way determination for future foundry practice is developed. From the yards where they are stored after the risers have been taken off, the ingots are taken to preheating furnaces; then to forging furnaces, where the correct forging heat is obtained; and, finally to a large hydraulic forging press. This press is the most spectacular piece of apparatus in connection with the manufacture of the shells. By its use the solid hectagonal ingot is transformed into a hollowed cylinder. The ingot at a temperature of 1296 degrees Cent. is placed in a container and a piercing mandrel or punch, placed against one end, is forced slowly 44 inches into the red-hot metal. The initial action under this forging operation is that of compressing the ingot. As the mandrel starts its slow movement in the end of the ingot, the hot metal completely fills the container.

As the progress of the punch con-

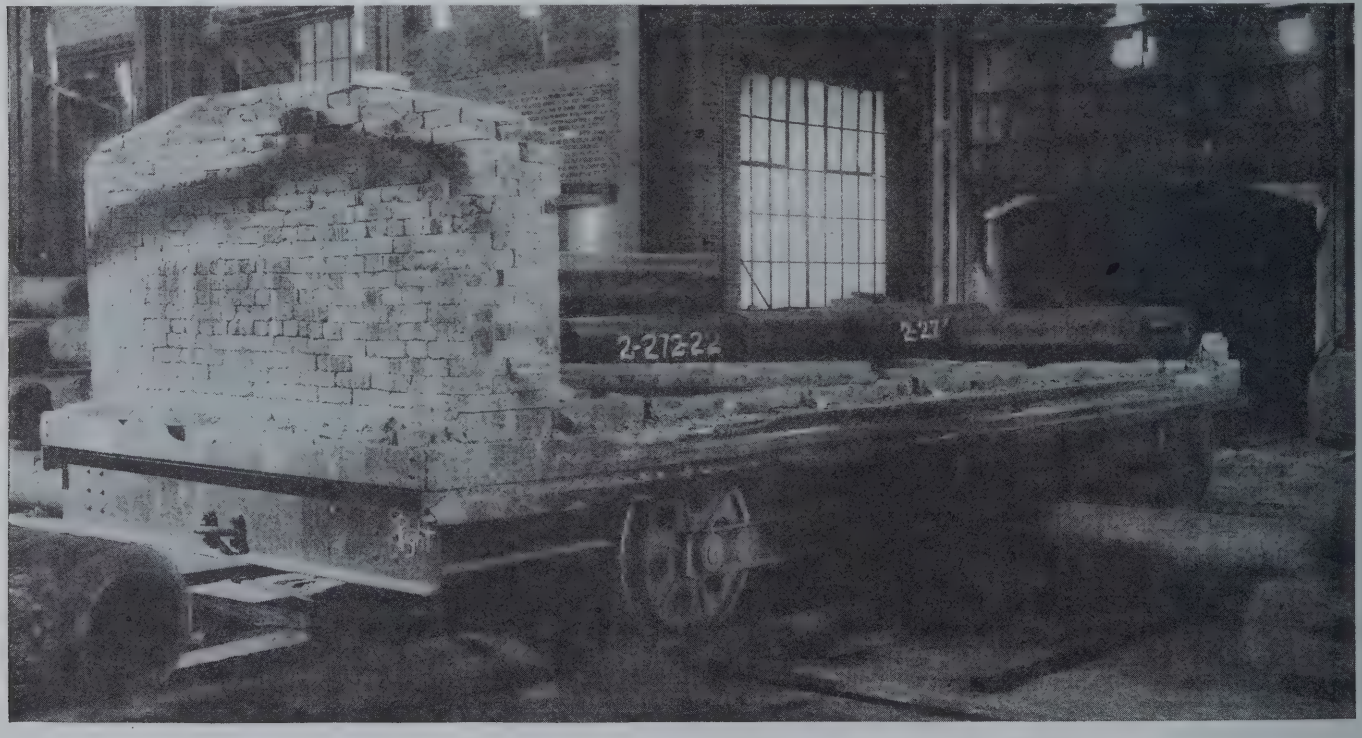

FIG. 4—AN 80-TON CAR BOTTOM FURNACE IS USED FOR ANNEALING THE SHELLS AFTER FORGING. THE ANNEALING PROCESS REMOVES ANY STRAINS DUE TO FORGING AND GIVES THE STEEL FREE MACHINING QUALITIES

tinues the metal flows back along the shaft of the mandrel and compensates for the metal which is forced out of the central cavity. The punch, when withdrawn from the newly-formed shell, recedes through a spraying coil, which by a constant play of cold water, drives the heat forward and off the punch end. This punch end or nozzle, as it is called, is a separate piece screwed on to the steel shaft of the punch proper, and is made of chilled cast iron this having been found to stand up under the scoring action of hot metal better than steel. The shell is forced out of its container by a hydraulic press and is then taken by a crane to storage piles where the numbers, which have been effaced during the forging, are stamped on by dies while the metal is still red.

Shell Order Preserved

The order of taking the ingots from the forging furnace and the forging press follows a definite, carefully worked out system, so that a shell number would be known even if the lettering could not be read. The shells whose numbers have been stamped are taken from the stock piles and placed on an 80-ton car bottom furnace, shown in Fig. 4. After annealing, the open end of the shell is cut off to length, and the shell is centered for turning. In order to confine the boring operation to a minimum, the shells are centered with respect to the internal cavity, rather than to the outside dimensions. To accomplish this each shell is lowered over circular revolving guides.

The upper guide fits into the tapered portion at the base end of the cavity and thus centers that end. The lower guide is made in the form of a frustrum of a cone with its base larger than the cavity opening, and therefore as the shell is lowered onto this frustrum guide the open end also becomes definitely centered. The position of the shell on the centering device is shown in Fig. 5. The guides are of the ball-bearing type so that the shell when resting on them is easily revolved. An outside centering point is brought down from above, and in this way locates a point on the outside of the top of the shell, which is on the axis of the shell cavity.

In the next operation the shell is rough-turned and the base end is partially cut off. This partial cut is shown in the standing shell in Fig. 7 and the reason the cutting-off operation is not carried to completion, is that the slot formed by partial cutting provides an excellent means for holding and withdrawing the shell during the nosing operation. After this the cavity is bored in the large boring lathe shown in Fig. 8. This is the final operation on the interior of the shell and it leaves the lines of the cavity in the body of the shell accurately conforming to the required dimensions.

Forge is Used for Nosing

Forming the nose of the shell, or ogive, as it is technically called, is perhaps the most interesting stage of the forming operation. The method of

FIG. 5—SHELLS ARE CENTERED FOR THE BORING OPERATION BY PLACING THEM ON AN UPRIGHT BALL BEARING SUPPORT

nosing the shells is merely a development of the ordinary steam-hammer forging process. The shells are placed in groups of six on a supporting frame directly in front of a small furnace, which is provided with circular openings corresponding to the positions of the six shells. The shells are carried forward until they project part way into the furnace openings. The heat is applied to the ogives of the shells only and as the walls of this portion are thin, it requires but 20 minutes to bring them up to the forging temperature which, in this case, is 1230 degrees Cent.

The shells are taken one at a time from this furnace by small traveling chain blocks and are placed in a Whelan-type nosing attachment, as shown in Fig. 7. This attachment is independent of the nosing press and consists essentially of a carriage, supporting a revolving universal chuck. The chuck, which is motor driven, automatically centers itself on the body of the shell. The shell thus fastened in the chuck is free to revolve, together with the chuck, on its axis. The carriage is provided with a friction drive and may be moved up to or away from the press.

Naturally the ogive of the shell, which heats rapidly, also cools off rapidly, and, therefore, it is important that the handling of the shell from the furnace to its position in the nosing attachment and through the nosing operation itself, be accomplished with a minimum delay. As soon as the shell is placed in the universal chuck the latter grips the shell at a predetermined pressure which, when reached, automatically shuts off the driving motor. A revolving motion is then given to the shell, and at the same time it is carried forward into the nosing press. The latter operates at 200 strokes per minute, and the shell is forced in and revolved as fast as the press will take it.

Feed is Automatic

Both the revolving motion and forward movement of the shell ahead are controlled by friction, so that, in case the press does not take the shell as fast as its forward motion requires, the friction clutch slips and eases up the travel. The hot shell, before it is run into the nosing press, is shown in the chuck in Fig. 7. A shell, which has just been taken out of the press, is shown standing at the left. The nosing operation draws the ogives down from an interior diameter dimension of 11.17 inches to an internal diameter at the extreme end of 3.75 inches and at the same time leaving the inside surface smooth. The shells then are transferred from the nosing press to the machine shop where the nose ends are faced. A small straight section is bored 3 inches long at the nose end and rough threaded. A temporary plug then is screwed into this threaded section in order to exclude water during heat treatment.

The details of the heat treatment for each group of 30 shells are determined from the records of their chemical analysis made at the foundry. The shells are quenched in water instead of oil and the temporary cap in the end of the shell is necessary because the water which otherwise would enter the shell would cause uneven cooling on the inner

surfaces. After the heat treatment one shell, selected at random, is cut up for test purposes. If the tests are satisfactory, the remaining 29 shells are accepted up to this point of the construction. If the tests are unfavorable the entire lot is reheat-treated or perhaps rejected entirely. From this point on the shells pass through successive operations in the machine shop until they are ready for the final hydraulic-pressure test. The operations in sequence are: Finish cutting the thread in the nose, which previously had been rough cut, finish cutting the boat tail or base end, facing the base end to exact weight, cutting the base-cover groove, and cutting the band seat. At this point the hydraulic-pressure test is made, through minute defects in the base metal. While these defects were not detected under any of the rigid tests, they were sufficient to let pass small amounts of the highly-compressed gas and thus to explode the inner charge and wreck the gun. This danger has been overcome entirely by using a base plate which consists of a lead disk covered with a thin copper plate. Such a combination seems to furnish just the resistance necessary to protect the steel shell.

Band Seat is Waved

It has been found necessary to roughen the band seat so that the copper band will not turn with the shell, as the rifling action takes effect. The easiest way to roughen the seat is to make wavy

FIG. 6—WHEN THE BAND SEAT HAS BEEN CUT AND GROOVED THE COPPER BAND IS PRESSED ON BY A HYDRAULIC PRESS BUILT LEVEL WITH THE FLOOR

and afterwards the operations to complete the shells include finish turning the band, washing in hot soda water, painting the interior with a spray gun, assembling the base cover, painting the exterior, and crating for shipment.

Weight Must be Accurate

The operation of cutting or facing the base end to exact weight is interesting. A curve showing the total weight of the shell at $\frac{1}{64}$-inch intervals is used. In other words, the different weights of the shell, assuming it were cut off at any one of a series of points $\frac{1}{64}$-inch apart, taken from the base end furnish a means for determining the exact point of cutting, in order to give the finished shell the correct final weight.

It was found in using high-explosive steel shells in guns that the powder pressure in firing sometimes was great enough to enter the chamber shell cuts, such as are shown in Fig. 6. The cutting operation is shown in Fig. 10. A turret lathe is used. The first cut leaves small collars or projections about ¼-inch wide and ¼-inch apart surrounding the groove. The part between these collars already is machined to the finished dimensions leaving the top surface of the collars to form the top surface of the finished wavy projection.

The wave is produced by using a V-shaped tool with the opening towards the work. If this tool were held stationary on a collar throughout the cut it would turn the collar into a straight sharp edged projection without any waving or irregularity. The turret attachment, however, is given a positive oscillating motion with respect to the motion of the lathe itself. By this means the sharp edge of the resulting projection moves regularly back and forth across the top surface of the collar to produce the continuous wave shown in Fig. 6.

When the grooves have been cut and the shell is ready for the band, it is swung by a crane out over the banding press. A hot band is placed in the press at the floor line, as shown, and the shell is lowered through it. The 10-segment press then firmly seats the copper on to the waved recess. Near this press is a band ring heating oven where the copper bands are brought to a cherry red temperature. A detail of interest in connection with this furnace is the design of the doors. In opening a standard hinge door for the purpose of inserting or removing the rings it was found that an appreciable amount of the heat in the furnace was lost.

To save time and heat a curtain, consisting of a double row of short lengths of chain, was hung in front of the furnace opening. This has been found exceedingly efficient inasmuch as little heat is dissipated through the curtain as it normally hangs. It is only necessary to catch hold of a band with a pair of tongs and to draw it out through the curtain. The bands are made of such size that when heated they will slip over the outside dimensions of the shell.

Punch Die Removes Hot Metal

The large hydraulic-forging press is considered the most important link in the equipment for manufacturing 14-inch shells. The press has a pressure of 4000 pounds per square inch and a rate of travel of 44 inches in two minutes. It was built by Henry Berry & Co., Leeds, England, to exerting a total force of 2000 tons. The ingots are brought to this press at a temperature of 1296 degrees Cent. The machine is designed to take one ingot at a time and the rapidity of operation from the standpoint of the press is limited by the heat developed in the punch.

Each ingot as it comes to the press is placed in a heavy cast-iron cylindrical frame which is fitted with a replaceable cast-iron liner or interior section. The purpose of the latter is to give the proper diameter to the forgings. Steel bands are shrunk onto these cast-iron liners for greater strength against bursting. A shell is pushed to the back of the container by the first stroke of the plunger and then is pressed to a depth of approximately 40 inches with the second stroke. During the early operation it was thought necessary to upset the ingot in the press container before pressing so as to force the hot metal to completely fill the die. It was soon discovered, however, that this second operation could be done away with The pressing causes the metal to flow not only to every corner of the die but back along the spindle of the mandrel itself to provide for this space taken

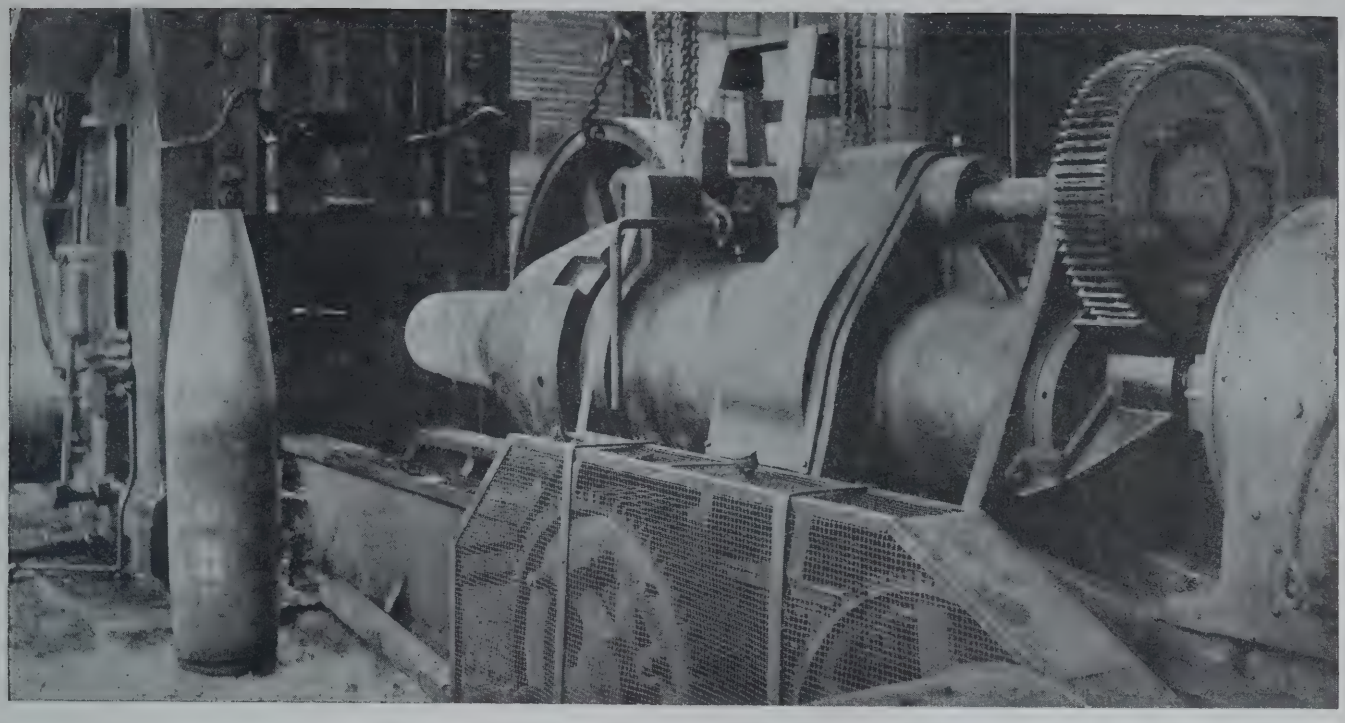

FIG. 7—AFTER THE BORING OPERATION IS COMPLETED THE SHELLS ARE HEATED AND TAPERED IN A NOSING HAMMER WHICH OPERATES AT 200 STROKES PER MINUTE

up by the mandrel, as it moves forward. After the mandrel is withdrawn from the completed forging, an auxiliary press is operated to eject the forging from the press container. Fig. 3 shows the forging just after it has been ejected from the container. It lies on a part of a heavy casting which forms the press end of the large machine. The mandrel has just been drawn back through the coil of pipe and has been cooled by the jets of water which play upon it from the inside of the coil.

A peculiar detail noticed in connection with the forging operation is that the nozzle or end piece of the mandrel must not be too hot nor too cold, previous to its being forced into the hot ingot. The first difficulty encountered in attempting to increase the speed of the press was that of cooling this nozzle. It was found by running one ingot after another through the press the nozzle became so hot that it scored badly and finally could not be used. The method of cooling at that time was by means of a short hose held in a man's hand. The cooling effect came constantly upon the end of the nozzle and much of the heat was driven back into the heavy part of the mandrel. In the attempt to cool the nozzle more quickly, the coil shown in the illustration was devised. This worked so successfully that the nozzle became too cool for best results.

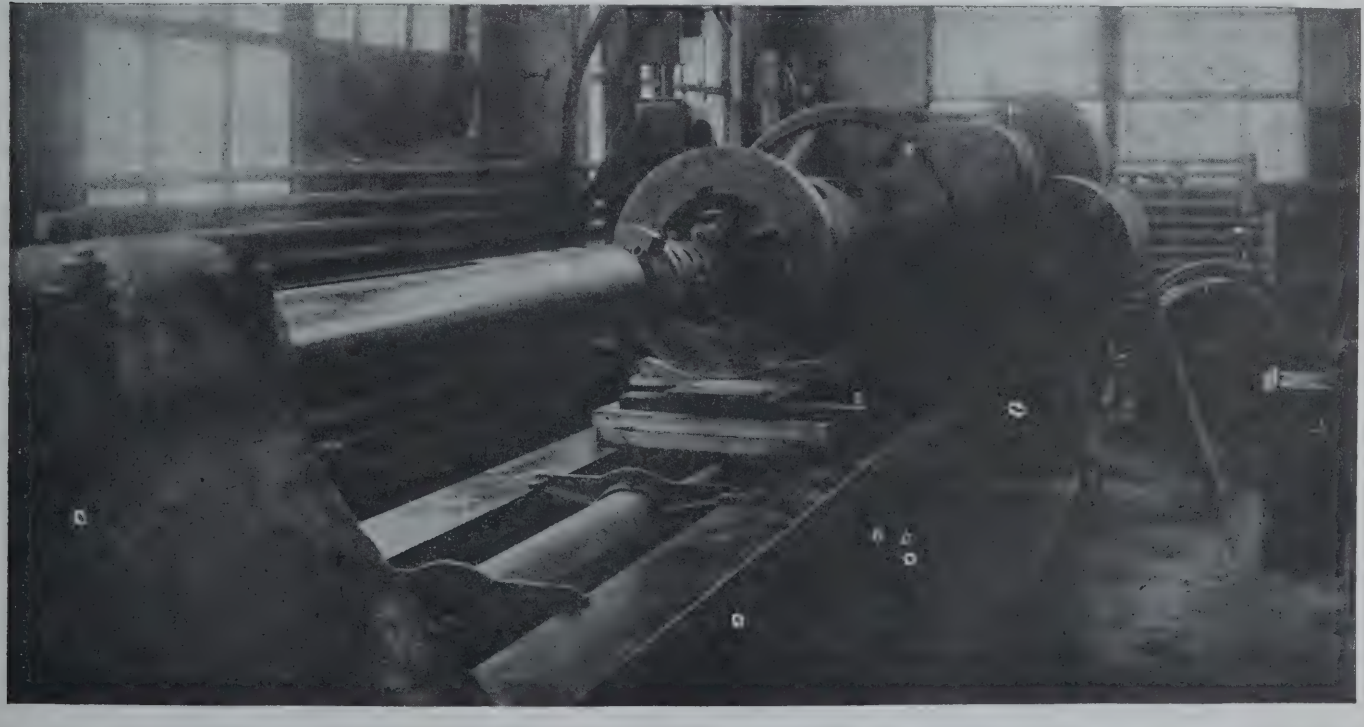

FIG. 8—SHELLS PLACED IN A HEAVY CAST IRON CHUCK ARE BORED ACCURATELY WITH A MULTIPLE POINT TOOL WHICH GIVES THE EXACT OUTLINE IN ONE OPERATION

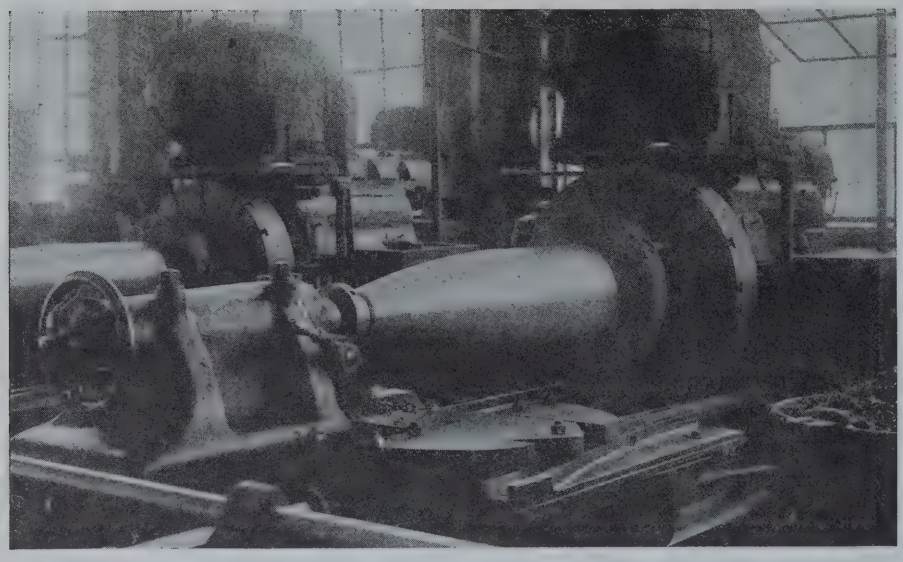

FIG. 9—AFTER THE SHELLS HAVE BEEN TAPERED BY THE NOSING HAMMER THEY ARE MACHINED ON LATHES

It was then necessary to decrease the amount of water used.

When for any reason the nozzle becomes cold, it must be partially heated before starting the punching. In practice, therefore, it is necessary to strike a balance between the amount of cooling water used and the interval from one operation to the next. The full capacity of the press has never been reached, and probably never will be, in the present plant, on account of the limit in furnace capacity and the lack of necessity. The furnace capacity until recently was entirely inadequate to economical production from the labor standpoint.

The 16 ingots which could be heated at one time were easily forged and handled in about half of the day's shift. And yet the number of men could not be cut down on account of the requirements of the work. In bringing the ingots up to the forging temperature of 1296 degrees Cent. it is necessary to conform to certain requirements as to heating speed. The ingots must be allowed to soak and the best practice developed after considerable experience is to heat the ingots through a period of seven hours up to the desired temperature and to allow them to soak for four hours at that temperature before using them in the press. This means that the furnaces are occupied 11 hours with one set of 16 shells.

As each shell is taken out for forging, another shell can be put in its place and in this way if it takes three hours to do the forging, the first shell will have a three-hour start on the heating process. However, this does not help much in reducing the loss of time of the men. Several unused heat-treating furnaces near at hand were brought into service. Their temperature limit was about 1000 degrees Cent. however, and thus their use was limited to preheating.

The capacity of the heat-treating furnaces was several times that of the forging furnace. The scheme, eventually evolved and which is now used, was to slowly preheat the ingots in the heat-treating furnaces up to a temperature of 1000 degrees, and then to transfer these ingots to the forging furnaces in order to get the last 300 degrees necessary to bring them up to the forging temperature. This has been highly successful and the production of the plant through this and other changes has increased from 16 to 45 shells per day without addition of a single man.

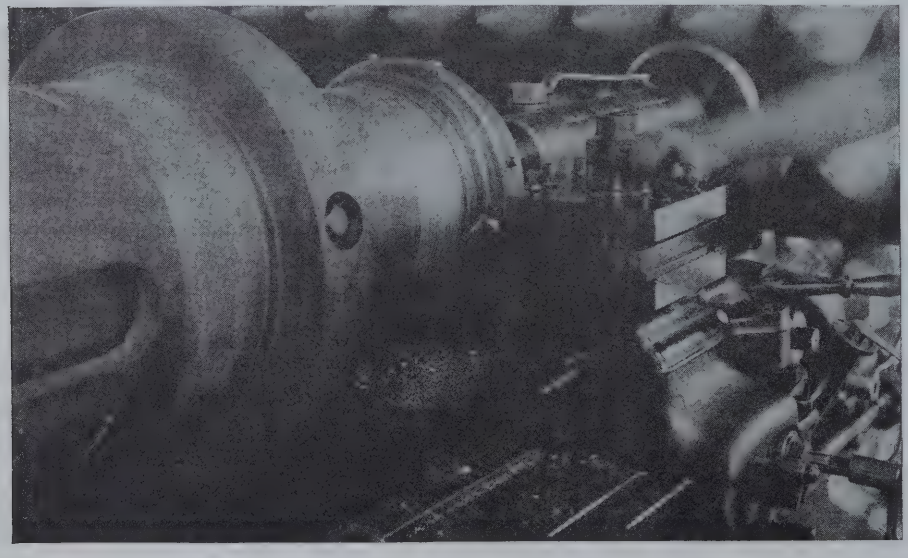

FIG. 10—WAVY GROOVES ARE CUT ON A TURRET LATHE EQUIPPED WITH AN ATTACHMENT WHICH OSCILLATES WHILE CUTTING

Germany Prospecting For Mineral Wealth

Various reports have been heard concerning discoveries of iron ore in the Hunsruck region of Germany, but not even in Germany itself are they considered seriously. Professor Beyschlag, of the German geological bureau, is quoted as saying:

"The deposits are found in the calcaire strata, the ore being classed as brown hematite of a very variable quality, but averaging 38 per cent. The position of the ore is a great advantage with respect to its possible exploitation. The deposits cover several thousand square kilometers, but are frequently interrupted for long distances.

"In certain points they form pockets five meters in depth. While as a rule they are near the surface there is always the possibility of their being too deep for economical working. At all events, Germany's situation today is such that the country must take advantage of every possible resource and adopt new methods of working, above all so far as concerns the recovery of the riches of the soil."

Various financial organizations are interesting themselves in the ore beds of Hunsruck and Franconia, but considerable time must elapse before their exploitation can be profitable. At present it appears that the ore is largely in the form of dust and has to be molded into bricks for the proper reduction.

Professor Beyschlag estimates that outside the region of the Suabian Alps Germany may still hope to find other deposits in Westphalia, near the western frontier.

Finally there is much talk in Germany as to the possibility of finding a combustible mineral oil in Hanover. Professor Beyschlag has visited various points in the district, and in his opinion nothing of commercial practicability is assured.

Wages Based on Guesswork

Industrial Unrest Likely to Continue Until Unscientific Way of Paying is Done Away With—Research Bureau Proposed for Determining Value of Services — Elements Lacking for Making Collective Bargaining Effective

BY A. L. DE LEEUW

UNREST among the laboring classes is so widespread that it is timely to discuss the various items which enter into the present relations between employer and employe, even if no prescription for a cure can be given at present.

It is well recognized that where two parties have a difference of opinion the first step should be to find some common ground from which to start, and that then the second step should be to define clearly and precisely the chief terms which enter into the controversy. One reason why discussions so often fail to bring the desired results and why they are often not started at all is that there is no clear understanding of some of the most commonly used terms in these controversies. The writer wishes to call attention to some of these terms, and to some of the misunderstandings in regard to their meaning.

We read practically every day about war between "capital" and "labor," about the demand of the laboring man for the "right to organize," and of his right to insist on "collective bargaining," and yet these three terms, which are perhaps used in every controversy that comes up, are not only not defined but they are actually misleading in themselves.

If war between capital and labor means anything at all, it must mean war between capitalists and laboring men. Capital is the result of past labor used progressively. Without capital, civilization is unthinkable. Capital is the tool with which the laboring man works. There can no more be war between labor and capital than between the laboring man and his tools.

Centralized Control Dangerous

In late years the control of capital has been more and more centralized, or, in other words, in the hands of fewer individuals. And though it is well recognized that this condition has its advantages in many ways, yet the dangers to which such centralized control may well lead have caused it to be regarded with suspicion and enmity.

It has been pointed out many times that there are really three parties, not considering the general public, which have a right to be heard in this controversy, namely, capital, labor and management. It seems to the writer that this merely leads to complication without any compensating features. Management and labor are both labor, but of different kinds. If at times they clash it is not due to unavoidable conditions but merely to defects in one or the other.

"Right to Organize" Misunderstood

Another term which should be quite familiar to all of us by this time is the "right to organize." Whether this term was purposely created by labor organizations as a slogan which ought to appeal to every fair-minded man, or whether it has just naturally slipped in, the writer does not know nor does he care. What he does care about is to have this term defined in such a way that no one with a fair amount of intelligence can mistake it for something else. If the purpose for which the employe wishes to organize is legal and proper, the third party, the general public, will naturally concede this right and quite as naturally inquire as to whether the employer has really denied this right to his employe.

Now, the facts in most cases where this right to organize has been brought to the foreground are these: A labor organization thinks it proper that the employes of a certain establishment should be gathered into its union. This, by the way, is perfectly proper, and no objection could be taken to it. The organization succeeds in gathering in part of the employes. The employer, fearing that this activity may lead to a strike, attempts to keep the other employes from joining the union; in other words, he tries to organize them with him instead of with the union. This also is perfectly proper. To make the claim at this point that the employe has been denied the right to organize may be good politics but is not quite correct. It is doubtful whether in late years there have been many cases where the employer has denied the employe the right to join the union, even if he was not in favor of it. When undesirable conditions or relations existed between employer and employe, or perhaps when union activities led to a strike, it was quite customary to make a demand on the part of the men for the right to organize, yet this right had seldom been denied. But put in this way the general public would get the impression that all kinds of organizations of the employe are taboo. What is really meant by the "right to organize" is that the employer shall give, not to *his men,* but to *some labor union,* the right to come into his shop and organize his men into a union; and apart from the question as to whether this is desirable or equitable, it is certainly different from the idea which the expression "the right to organize" conveys.

Another term which is misleading, even more so than those mentioned before, is "collective bargaining." So far collective bargaining has been collective, it must be admitted, but it has not been "bargaining." In collective bargaining it is supposed that some or all of the employes have delegated the right to bargain for them to some attorney or business agent.

Bargaining Has Never Been Used

In practically all cases this business agent is their union, and this union, according to the term used, is supposed to bargain with the employer. As a matter of fact, however, there is no bargaining, and, under the present conditions, there can be no bargaining. There have been cases where the men were entitled to all they asked for, and possibly more; there have been cases where the men were not entitled to as much as they asked for, but the method of bargaining has never been employed, and, in the writer's opinion, *could not* have been employed, to settle the differences. The issue has been brought to a conclusion by strikes, or threats of strikes, which is no more a method of bargaining than when a man points

---

From a paper presented at the annual meeting of the American Society of Mechanical Engineers, New York, December, 1919. The author, A. L. DeLeeuw, is a mechanical engineer.

a gun at his debtor to collect a bill.

There is still another point about this question of collective bargaining which should have all the light possible thrown on it. Is collective bargaining, bargaining by *all* the employes? Is it bargaining for a group or part of a group? If it is bargaining by a union, acting for a group, should the representative, the union, show credentials before bargaining starts? Such a course of action might reveal the weakness of the union or of the employer, but would it not be for the best interests of the third party, the general public?

In offering labor and demanding money, one of the principal requirements of a bargain is missing. When we say that the price of eggs is 75 cents, we mean, per dozen. When we say that the price of land is $200, we specify per acre. But when we say that the price of labor is 75 cents, we do not know what this means. There are measures or quantities by which to sell eggs or real estate. If a house is sold, though there may not be a measure of the value of the house, there is at least a chance for the prospective buyer to look it over and make his own estimate, or if you wish, guess, as to what the house is worth. But when it comes to buying labor we have no measure nor can we estimate its value by personal observation, except after the labor is done, which is long after the so-called bargaining took place, long after the price was set. It is true that labor is sold by the hour, but the hour is a measure of time, not of labor.

At the present time labor is not sold by measure but a workman sells his time. This inability to strike a bargain because the value of the product to be sold is entirely unknown, is, in the writer's opinion, one of the greatest difficulties to be overcome before there can be an equitable adjustment of the differences between employer and employe. The fact that labor is sold by the hour is equally unjust to both parties. Sometimes the employer suffers, sometimes the employe. In all cases it is a source of curtailment of production, and this leads at once to a discussion of wage system.

"Wage" is defined as remuneration for work done. It is also defined as remuneration for time given. The second definition seems to be defective. In the first place, when money is paid for time given it is called "salary." In the second place, and this objection is more serious, time alone is not bought or paid for. There are many occupations in which employes must wait until something turns up for them to do, and then they are supposed to do it. It would not be proper, then, to say that they are paid for their time. It would be more proper to say that they are paid for the labor which they perform within a specified amount of time.

There are cases where, practically speaking, time alone is sold. Such is the case, for instance, with a stationary watchman. Even in such an extreme case something more than time is paid for: the man's watchfulness and faithfulness. In other cases time and labor are paid for: For instance, with a machinist's helper, or a blacksmith's helper. In still other cases time and skill are paid for: For instance, the man running a large planer or boring mill.

Finding a Measure for Labor

The great problem before us is to find a measure for this labor, in order to obtain an equitable way of paying for it. In a large portion of work there is a combination of time, physical presence, labor, skill, knowledge, judgment, and probably other factors which are hard to define, such as reliability, steadiness, enthusiasm, loyalty, ambition, and whatnot. To make up a formula which would embody all these elements and from which a man's value could be calculated is, of course, impossible; and yet, unless this can be done there is no possibility of avoiding differences of opinion between employer and employe as to the value of a man's labor. The writer has gone into this matter somewhat at length, because to realize that a mathematical solution is not possible is also to realize that a compromise system *must* be developed.

There are various systems of payment in existence at present, straight wages, piece-work system, various systems of bonus payment, premium payment, and combinations of these systems. The wage system considers nothing but time and physical presence. The employe knows exactly what he will get, and guesses at what he will have to deliver. The employer knows exactly what he must deliver, and guesses at what he will get. He has no means to bring the employe's output up to his conception of what it should be, unless the employe falls so far behind the employer's expectations that he makes a new guess and fires the man.

With the piece-work system the employer knows exactly what he will get for his money, but the employe makes a guess as to how much he can reasonably do; he has no control over the conditions which will enable him to do, or prevent him from doing, as much as he is expected to. There are various kinds of bonus systems. The employe may earn his regular wages and get a bonus at stated intervals if his work exceeds the expectations of his employer; or he may be working under the task-and-bonus plan, in which case there is less guessing and more of an attempt at a definite bargain. If the employer is in earnest with such a system, and sees to it that it is possible for the employe to fulfill his task, then this system approaches quite closely to true bargaining.

The premium system is an attempt at gaining the interest of the employe by making him invent improvements in the method of working and sharing the profits with him; but unless the time originally set was carefully studied, and unless all conditions of machinery, tools, existing knowledge, and so on remain unchanged, this system also will lead to controversies and injustices.

To sum up, the pure wage system is no bargaining in any sense of the word; the piece-work system is only bargaining if employer and employe have reached an agreement, and if there is some mechanism by which this agreement can be changed as soon as conditions change; the pure bonus system is nothing else but a wage system with a kind of profit-sharing plan; the task-and-bonus system, if properly worked out and if accompanied by complete instructions to the employe, is a perfect bargain, but must be constantly revised as conditions change. However, this system carries with it the necessary mechanism to effect these changes.

It will be seen from the foregoing that wherever bargaining is possible it must be done, not only by each employe individually, but by each man separately every time his work is changed; in other words, each new operation he performs should lead to a new bargain. Unfortunately, the number of operations which can be fully analyzed and for which complete instructions can be given, is relatively small. There is no doubt but that it could be followed in many, many cases where it is not followed at the present. But, looking at the world's work in its entirety, the total percentage of the work which can be treated in this manner is small.

Whatever attempt has been made up to date to place labor on a con-

tract basis, on a basis of bargaining, has been done entirely by the employer, and has been antagonized by organized labor. And yet it is the writer's opinion that the ultimate solution of labor trouble must be based on some method of bargaining, probably collective. Taking the aims of organized labor to be: Proper share of the proceeds of labor, reasonable working conditions and working hours, right to organize and collective bargaining, the writer believes that these aims could all be accomplished without strife if the last item, collective bargaining, were put into actual practice instead of being a mere catchword.

If employers and employes together would put as the first item in their catechism the truth that the world must produce more in order to have more; if employer and employe together would try to find an equitable way of estimating the value of work done; if both would subscribe to the truth that no permanent gain can be made by wearing out a man's capacity for work nor by allowing him to work less than he should for the good of the world at large; if then employers and employes together would organize a bureau of research for defining the conditions under which various classes of work should take place; and if finally an attempt were made by both employers and employes to classify men according to their natural or acquired ability, there would be very little reason left why a union should be a fighting organization.

It is the writer's belief that the crux of the solution lies in the establishment of a proper wage system, and that in order to establish such a system the engineer must come to the assistance of labor in order to find standards of value for work done. Though it is not likely that there will ever be a time when every human activity can be scheduled and analyzed, yet by far the greater part of industrial operations can be treated in this way.

Standardizing Offers Difficulties

It hardly need be pointed out that to set such standards of value of work must necessarily be a gigantic task. In addition to the many technical difficulties in estimating values of products, there are other elements which must not be forgotten. There are many cases where operations are required which call for extreme skill, possessed by only a few, a skill which can never be found in the mass of the people. As a rule, people possessing such skill love to employ their gifts, they love their work and are willing to produce for less than their product is worth. Such skill should be estimated at its proper value, not only as a matter of justice to the workman, but also because he may finally lose his enthusiasm and industry at large would suffer.

There are operations where steady nerves are essential, some where physical courage is required, others which cannot be successfully carried out without many years of experience, etc. Such points should all be considered. The value of driving a rivet in some dangerous place of a new skyscraper is higher than that of driving a rivet in a boiler shop. The ability to judge the temperature of a piece of steel by its color is only obtained by many years of experience. This ability could not be called skill, though it is closely related to it.

Consideration should also be given to what constitutes a proper minimum and a proper maximum wage. In repetition operations it is sometimes possible for the operator to produce large amounts of work but only at the expense of extreme weariness, and in the long run such a man is not employed to the best advantage of the world at large. Recognition of this fact has led to the prescription of rest periods. On the other hand, there may be cases where it is expedient to employ men not skilled in the operation they are supposed to do. This may happen because skilled men are not available at a given time or place, or because special conditions call for an unusual amount of this class of work. Though the value of the product of such men might be low, they should receive not less than a minimum wage. This minimum wage, however, is in itself difficult to determine. A satisfactory minimum wage for an unmarried young man is not at all satisfactory for a married man with a large family.

The real cause of the present-day unrest lies in the fact that there is no unit of measurement which both employers and employes can use; or, in other words, the fact that our present wage system is not based on knowledge and justice, but only on guesswork and on the fear that the one may "do" the other.

Applying Electric Furnace to Foundry

BY W. E. MOORE

UP TO the present time the electric furnace has had its largest commercial development, first, in the manufacture of aluminum, second, in the manufacture of steel, third, in the manufacture of ferroalloys, and fourth, in the manufacture of calcium carbide. At the end of 1913 there were only 19 electric furnaces installed in the steelmaking industry in America. This number had increased to 136 at the end of 1916, and to 269 at the end of 1917. At the present time the number of steelmaking furnaces in use in various industrial countries of the world is 815, of which 290 are in the United States and 45 in Canada.

The average capacity of these furnaces in America is 0.37 tons per heat when used for ingots, and in the foundry business, 1.7 tons per heat, though the ordinary size now most generally used in foundries is the 3-ton. More than 99 per cent of all the steelmaking furnaces are of the arc type, less than 1 per cent being of the induction type, which was popular in the early days of the art.

Primarily, electric steel became popular because of its desirable physical properties. The bureau of standards reports regarding the superior qualities of electric steel as follows:

The characteristics of electric steel are great homogenity and freedom from segregation. It is somewhat higher in tensile strength and elastic limit than other steels and owing to its greater density, shows a marked resistance to fatigue.

Being absolutely "dead" when properly made and averaging lower in sulphur, electric steel in the foundry is less liable to show shrinkage cracks between ribs of castings, and, being more fluid, it is not so liable to piping, blowholes, cold shuts or misruns, and in tool steel it takes heat treatment more effectively and will stand greater abuse in heating.

The electric furnace is especially useful for making alloy steels. Since the metal is treated in a reducing

From a paper presented at the annual meeting of the American Society of Mechanical Engineers, New York, Dec. 2-5, 1919.

atmosphere, there need be no large losses of the added elements, such as silicon, manganese, vanadium and chromium.

The acid-type furnace is best suited for foundry work and the most popular size has a capacity of 3 tons per heat, though sometimes 1.5-ton or smaller furnaces are required. The more highly powered and rapid furnaces for such work turn out from eight to 16 heats in 24 hours, and with a power consumption of from 500 to 650 kilowatt-hours per ton of liquid steel and considering the ultimate efficiency of the large modern turbo-generator power house at, say 1.5 pounds of coal per kilowatt-hours, its fuel consumption might be said to be equivalent to from 750 to 900 pounds of coal per ton melted, and the coal need not be of high grade nor low in sulphur and phosphorus as is necessary with fuel-fired furnaces. Basic furnaces require more time and power, heats ranging from four to eight per day, and since the charge is melted in a reducing atmosphere there is practically no oxidation of the metal; consequently thin scrap, light turnings or scrap of other forms such as can be conveniently charged into the furnace, may be melted. Such scrap on the present market sells for approximately from $5 to $10 per ton less than low-phosphorus, heavy melting scrap necessary with the ordinary acid open-hearth melting furnace installation.

The furnace atmosphere, being of a reducing nature, makes it easier to refine and kill the steel, resulting in a saving amounting frequently to half of the ferroalloys necessary with converter steel, effecting a saving of, say, $2 per ton.

Comparative Costs of Electric and Converter Steel

With the electric furnace, men can readily make and check their steel to an exact percentage of carbon, manganese and silicon and can easily keep the undesirable sulphur and phosphorus to low limits. The steel may be readily alloyed with nickel, chromium, and vanadium to make the higher grades of steel castings to replace forgings and for special purposes, such as may be required for parts of unusual strength, ductility or for cutting tools. It is entirely feasible to make castings which will run up to an ultimate strength of 130,000 pounds per square inch, or to cast high-speed steel milling cutters and reamers to form for grinding.

Very fine results have been obtained with malleable iron made by treating cupola metal or by melting cold scrap in an electric furnace. The ability to refine for sulphur and phosphorus and to add ferroalloys to adjust the mixture to the proper malleabilizing formula, together with its very rapid operation, give the electric furnace a decided advantage in malleable-iron foundries, particularly in working on high-phosphorus southern irons.

In the nonferrous metal industry the electric furnace has shown remarkable economies, due to the saving of cost of crucibles and the greatly reduced metal losses caused by oxidation and volatilization. For such work special types of furnaces designed to avoid localized heating are necessary.

As to the most suitable type of electric furnace for a given installation, if the scrap be inferior and high in sulphur and phosphorus, then the extra cost, slower operation, and shorter refractory life of the basic furnace must be endured to obtain the lower limits of sulphur and phosphorus not practicable to reach with the acid furnace using poorer grades of scrap. At present the call is for acid-lined furnaces, and cheap, good scrap is available in large quantities for foundries, and basic furnaces for alloy and tool steel. The acid furnace is simpler, cheaper and faster to operate and the steel casts more easily, while the basic furnace is essential for tool steels.

It is strongly recommended in any case that a furnace be so designed and constructed that it is adaptable to basic operation. This means that the furnace shell must be of large diameter and the bath of large area and shallow. The furnace should not, it is thought, be of the long-arc type, nor of the small diameter, deep bath type, if the best and most rapid work is contemplated. Indeed, even for acid melting there is a noticeable difference in the quality of the steel obtained from the large diameter, shallow bath furnaces compared with that made in the deep bath type furnace, for with the latter it is not feasible to obtain the same mechanical reactions from the additions put in to refine and kill the steel as when the bath is of the shallower type. Nor is it possible so thoroughly to deoxidize the metal by maintaining a reducing atmosphere in the furnace.

It is quite important that the furnace should operate at the highest practicable power factor that can be obtained without undue disturbance of the power company's load, for by so doing the electrode, transformer, line and generator losses are maintained at a minimum. Engineering skill of a high order is required to forecast and select the best type of equipment, under the many varied power-supply conditions which obtain in different localities.

By reason of the now generally acknowledged superior quality of the product, greater flexibility of operation, quicker, more convenient sized heats, and saving in alloys and in cost of melting stock, the electric furnace is rapidly coming to the front in the steel foundry and alloy and tool steel works wherever suitable power is available and progressive policies are in vogue. It is making possible the profitable operation of widely distributed small steel foundries to an extent not generally realized and greatly reducing the investment cost required in tool steel works.

Engineering Dean Defines Proper Training

That the federal control of education is undesirable was the opinion expressed by C. H. Benjamin, dean of the school of engineering of Purdue university, Lafayette, Ind., before a recent meeting of the Cleveland Engineering society. Dean Benjamin defined education as the training of mental powers rather than the acquisition of knowledge. Boys are placed in three arbitrary classes: Those who go to work at 16, those who go to work at 18, and those who go to college. As a result each class must have different education in order that its members mature into good citizens. The first group, which finishes the grade school, should not have vocational work as plenty of time is offered for apprenticeship work to gain that training. All of the time should be spent in fundamental teaching. Some vocational work should be given the second group, which attends high school, as the period in which to obtain training through apprenticeship is limited. The third group should receive proper training to prepare the members for college courses.

Five and six-year college engineering courses seem too long since most students are dependent upon their parents during that period. As a result the four-year course must be compact and well balanced. Extensive teaching of English is highly essential and foreign languages are desirable since they result in good expression. Shop practice should be well advanced to illustrate efficient methods. Economic problems and their suggested solutions should receive much attention.

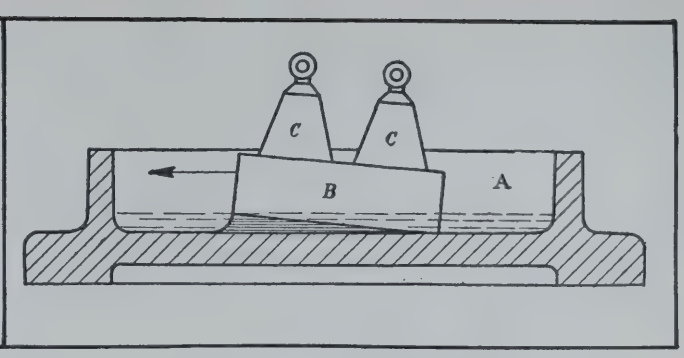

Fig. 2—Formation of Oil Film, Final Stage

Selecting Lubricants for Bearings

Principles Underlying Lubrication of Ball Bearings Differ From Those Applying to Plain Bearings — In Ball Bearings Oil Film is Only Possible at High Speeds When Slippage Occurs

BY H. R. TROTTER

AN INVESTIGATION of existing literature on the subject of ball-bearing lubrication reveals the fact that up to date a comprehensive study of this particular phase of lubrication has not as yet been published. The efficient lubrication of the plain sleeve-type bearing presents few difficulties, as the engineering world is in possession of an accumulation of data acquired during many years of patient study, experiment, and practice.

In 1885 Beauchamp Tower completed a series of experiments which he had made to obtain data regarding the behavior of a lubricant under various loads and speeds. These experiments were made at the request of the British Institute of Mechanical Engineers, and were later made the subject of a very thorough mathematical analysis by Prof. Osborne Reynolds. The outstanding feature of these experiments was the discovery of the wedge-shaped film of oil. Professor Reynolds later gave the rule for efficient lubrication, which is that where two surfaces are in sliding contact a satisfactory film of oil cannot be maintained unless the surfaces are at slight inclination to each other.

From a paper presented at the annual meeting of the American Society of Mechanical Engineers, New York, Dec. 2-5, 1919.

Oil Film Is Wedge Shaped

Fig. 1 shows a pan or tray *A* containing a small amount of oil. A flat plate *B* is loaded with weights, *C*. When in a stationary position the surfaces of the plate and pan are parallel to each other, but if the plate is pulled along the surface of the pan the leading edge rises and the plate flows on an oil film with the surfaces at an inclination to each other. The oil film assumes the shape of a wedge, as shown in Fig. 2.

The Michell thrust bearing, which is manufactured in Great Britain, and the Kingsbury thrust bearing, made in this country, are designed to take advantage of this phenomenon and both have proven very successful. The main features of a bearing of this type are shown diagrammatically in Fig. 5. *A* is the rotating member. *B* is the stationary member. The parts *C* are supported on pivots *D*. A bearing of this type with a diameter of 18 inches successfully accepts a thrust load of 160,000 pounds at a speed of 35 revolutions per minute.

The oil grooves of a sleeve-type bearing should be of such shape as to allow the formation of this oil wedge. Fig. 3 shows a correct groove and Fig. 4 an incorrect groove. When forced feed lubrication is used, the oil should enter the bearing at a point of low pressure and not at the bottom of the bearing which is near the point of maximum pressure. The oil grooves in a sleeve-type bearing are generally made wedge shape and not of semi-circular section, as experience shows that this is necessary to the formation of the lubricating film. The oil inlet on a force-feed bearing is placed at a point which is approximately the point of lowest pressure and not at the bottom of the bearing.

The final choice of a lubricant is at best the result of a compromise between the engineer and the chemist. This compromise is very often unsatisfactory and due in part to the chemist's inability to thoroughly comprehend the engineer's problem and in part to the engineer's lack of chemical knowledge.

All authorities are not agreed on the desirable qualities of a lubricant. Many claim that a high surface tension is a requisite, and others lay great stress on adhesive qualities. All are agreed, however, that a lubricant should have the minimum of internal friction. Generally speaking, the requirements of a lubricant for the plain sleeve type of bearing are a certain amount of adhesive quality

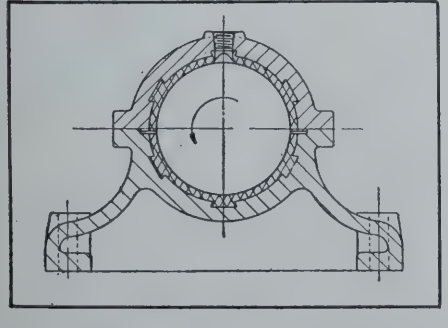

FIG. 3—CORRECT OIL GROOVE OF SLEEVE TYPE BEARING

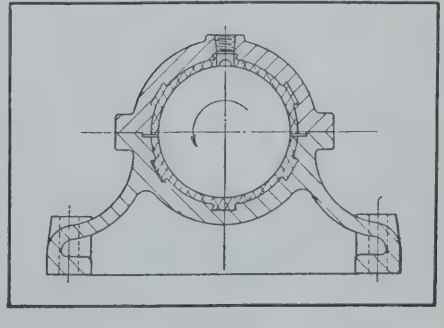

FIG. 4—INCORRECT OIL GROOVE OF SLEEVE TYPE BEARING

to enable it to adhere to both the revolving and stationary surfaces. It should have sufficient body to withstand the pressures. The lubricant film will therefore consist of three layers, which in operation approximate the features of a ball bearing in that one element is stationary, one rotating and one an intermediate layer consisting of globules similar to the balls in a ball bearing.

Body in a lubricant cannot very well be defined. It seems certain that its effects are opposite to those of viscosity. Professor Kingsbury gives the following relations of viscosity and body:

With increase of	Where the viscosity is effective the coefficient of friction	Where the body is effective the coefficient of friction
Pressure.....	Decreases	Increases
Speed.....	Increases	Decreases
Temperature....	Decreases	Increases

The two cardinal points of successful sleeve-bearing operation are: A design of such a type as will permit of the formulation and preservation of an oil film, and the selection of a lubricant that will provide a film of maximum strength with a minimum of internal friction.

With a ball bearing, however, the problem is not so easily understood, but the important points to be remembered are that the coefficient of friction is practically constant throughout wide ranges of loads and speeds; that an oil film is only possible at very high speeds when slippage may take place because the moving parts have metal-to metal contact; and that the coefficient of friction is lower in an unlubricated ball bearing at light loads and moderate speeds.

Coefficient of Friction Varies

In Fig. 6 curve *A* shows the change of friction coefficient of a plain bearing under constant load and varying speed. This curve is self-explanatory and shows that a satisfactory oil film is not formed till a certain speed is reached. In the same figure curve *B* gives the friction coefficients of a well-made ball bearing, and shows that the friction loss of a ball bearing is practically constant throughout wide ranges of speed. If an

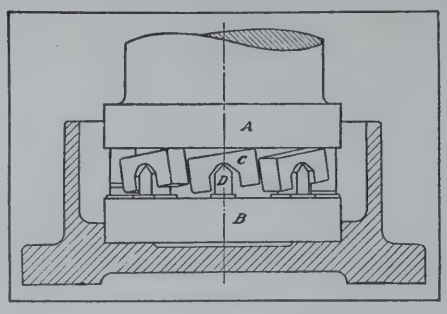

FIG. 5—DIAGRAMMATIC SKETCH OF MICHELL TYPE OF THRUST BEARING

oil film were formed between balls and races, curve *B* would possess the same general characteristics as curve *A*.

The difference between the friction coefficient of a lubricated and unlubricated ball bearing is shown in Fig. 7. This property of a ball bearing is not generally known, and should not be used as an argument in favor of operating ball bearings without lubrication. From the foregoing statements it should be evident that plain bearings and ball bearings possess such radically different characteristics that a true comparison is impossible. It naturally follows, therefore, that practically all the accumulated experience of the lubricating engineer is of little value when analyzing ball-bearing operation.

The use of a lubricant with ball bearings is necessary to protect the highly polished surfaces of the balls and raceways, and to minimize the slight friction between the balls and ball retainer. The small amount of friction between balls and retainer can also be minimized by careful design. The principal requirement of a ball bearing lubricant is chemical neutrality. The lubricant used must not contain over 0.10 per cent acid or alkali. There are many commercial lubricants on the market which come within this limit, but very few are acceptable because of their tendency to develop acid with age or when operating at high temperatures.

Experience shows that the most satisfactory lubricant for ball bearings is a highly refined mineral oil having the proper viscosity and cold test for the installation. Greases should be used only when operating conditions require viscosities greater than can be obtained with a mineral oil.

Should Not Run Submerged

Whenever a ball bearing is operated at high speeds, it is not advisable to run it submerged in a lubricant, and provision should be made to supply the oil from a pressure system. If such a system is not available, good results may be obtained by a large sight-feed oil cup. A few drops of oil per minute is all that is required.

At moderate speeds a heavy oil will generally give better results than a light oil. The substitution of a heavy oil for a light oil will generally result in a decreased operating temperature. This peculiarity may be explained by the fact that when the bearing is running at the actual operating speed, less opposition is offered to the rotation of the balls by the oil because of the inertia of the oil. In addition, there is less churning and frothing with their resultant air pockets. Air pockets in a lubricant act as insulators and prevent the transmission of the heat generated to the outer casing where it can readily be dissipated.

All mineral oils used on ball bearings should be highly refined, filtered, and contain a minimum amount of acid, alkali or sulpho compounds, and in order to insure the use of such oils the following specifications are suggested:

Free acid (calc. as oleic acid), maximum, 0.10 per cent; free alkali, absent; ash, maximum, trace; heat test (15 minutes at flash point), slight darkening, but no sediment; flash point (Cleveland open cup), minimum, 300 degrees Fahr.; fire test, minimum, 350 degrees Fahr.; viscosity at 100 degrees Fahr., Saybolt universal for light oil, 100 to 200 seconds, medium oil 200 to 300 seconds, heavy oil 300 to 500 seconds, and extra heavy oil, more than 500 seconds.

Most of the high-grade mineral oils

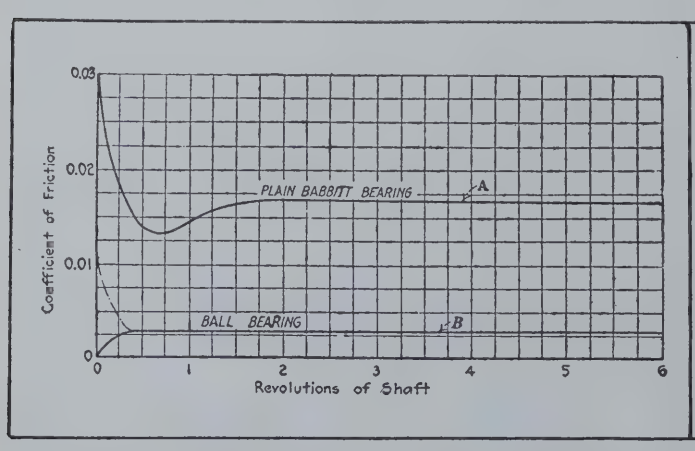

FIG. 6—FRICTION COEFFICIENTS OF A PLAIN AND A BALL BEARING

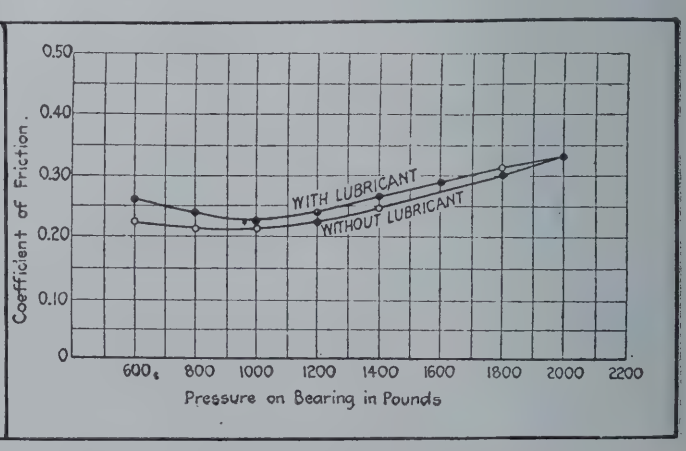

FIG. 7—FRICTION COEFFICIENT OF A BALL BEARING

conform quite closely to the above specifications. In connection with lubricating greases, however, the problem is more difficult. Many of the greases now on the market are entirely satisfactory for general purposes, but lack certain characteristics which experience shows to be highly important for successful ball-bearing lubrication.

A large number of greases contain lime soap as thickeners, a few are of the soda-soap type, while others are a combination of both. The lime greases are valuable in that they can be used without harmful results where moisture is present. Their consistency, however, is more easily changed by heat than greases of the soda type.

Suitable specifications which insure the production of lubricants suitable for ball bearings without putting any undue burden on the lubricant manufacturer are as follows:

Free acid (calc. as oleic acid), maximum, 0.10 per cent; free alkali (calc. as sodium hydroxide), maximum, 0.10 per cent; free lime (calc. as calcium oxide), maximum, 0.5 per cent; neutral saponifiable oil, maximum, 1.10 per cent; viscosity of mineral oil (minimum 200 sec., Saybolt universal, 100 degrees Fahr.), and abrasive particles (sand, etc.), absent.

Ball bearing manufacturers are quite agreed that the limit of free acid in a grease should not exceed 0.10 per cent calculated as oleic acid, and there are plenty of greases available which meet this requirement.

It is essential that the grease be comparatively free from unsaponified fatty oil, or as expressed in the analyses, "neutral saponifiable oil." This specification is imposed because the unsaponified fatty oil has a tendency to become rancid or develop an acidity with age in service, particularly when operating at high temperatures. We have established a limit of 1.0 per cent, and the above tables show that this can be met in most of the compounds which are suitable in other respects.

High Grade Mineral Oil is Best

One feature of grease lubrication which cannot be too highly emphasized is the importance of using a high-grade mineral oil conforming to the tests for purity as previously outlined. A grease may be perfect in every other respect, yet if a poor grade of mineral oil is used, the life of the bearing will be shortened.

In view of the high polish necessary on ball bearings, the elimination of abrasives such as sand particles, etc., is manifestly important.

It is also desirable to keep the free-lime content of the grease down to a minimum as any excess detracts from the lubricating qualities of the grease. Experience indicates that 0.5 per cent is a desirable limit. In some of the greases that the author has examined, small lumps of free lime were discovered to be distributed throughout the grease.

The highest-grade ball-bearing greases are put through a milling process after compounding. This treatment insures very intimate mixing of all constituents and pulverizes any chance impurity to an impalpable powder.

Microphotographs of various greases are reproduced in Fig. 8. *A* shows the crystals of calcium sulphate obtained from lime-soap grease; *B* crystals obtained from a soda-soap grease; *C* crystals obtained from a lead-soap grease and *D* crystals obtained from a potash-soap grease. Further investigations should be made to obtain data so that lubricating-grease specifications may be standardized.

Book Review

Foundry Practice, a text book for molders, students and apprentices, by R. H. Palmer; cloth; 390 pages, 5 by 8 inches; published by John Wiley & Sons, Inc., New York, and furnished by THE IRON TRADE REVIEW for $3 net.

The second edition of this book has just been published, much of the text has been rewritten and subject matter has been added. The additions include a description of the rigging and flasks and details the processes of securing and pouring molds to produce large propeller wheels economically. Other new matter in this edition deals with the patterns, flasks, cores, molding, setting and securing cores, gating pouring, and testing the iron for locomotive slide valve cylinders.

As in the previous edition this book goes thoroughly into the question of molding in its every phase. Green-sand molding is considered first, and methods are described for molding irregularly shaped patterns including gears. Pit molding, floor molding and bench molding also are described. Dry sand work and loam molding are fully detailed. After the subject of making and setting cores is finished, the questions of molding machines, sand and metallurgy of iron are presented. Under metallurgy might be classed the chapters on iron and its composition, the treatment of castings while cooling, mending broken castings, and the chapter on the cupola and its operation. In the back of the book is a glossary giving definitions of foundry terms and a number of tables containing useful data for the foundryman.

Organizing Modern Stores Department System Simple, With Few Form Cards

BY M. H. POTTER

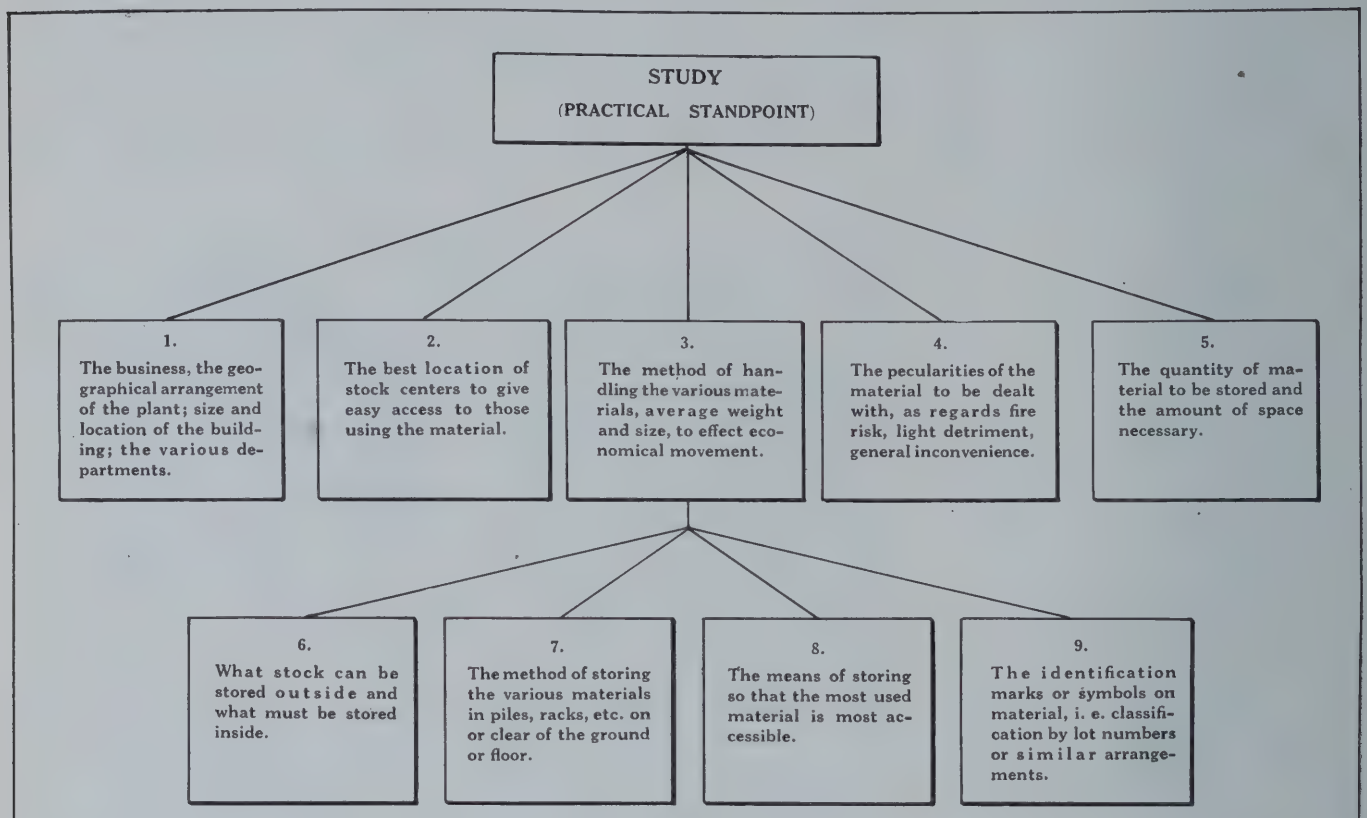

FIG. 1

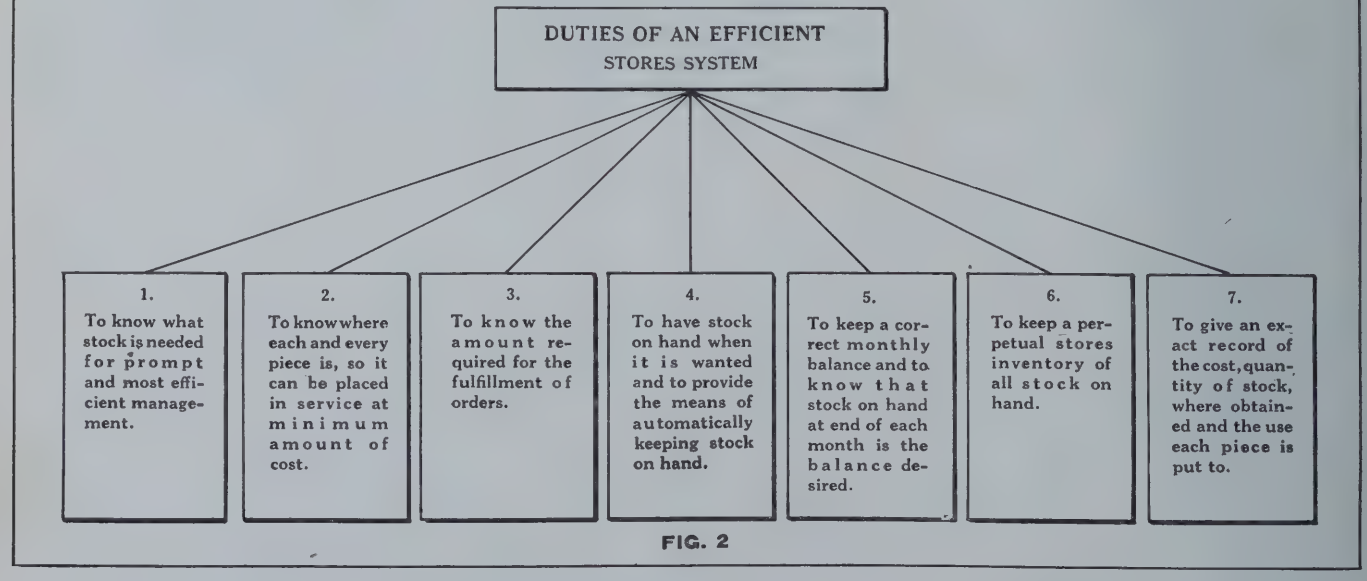

FIG. 2

ALTHOUGH the importance of an efficient stores system in manufacturing plants is generally acknowledged, many organizations lose much time in locating material, and also allow much material to go to waste owing to the lack of a little attention to this matter. An elaborate or expensive system is not necessary, but the establishment and maintenance of a satisfactory system require practical study, analysis of conditions, and the keeping of several card forms. Once in operation, the system may be easily maintained without trouble.

FIG. 4

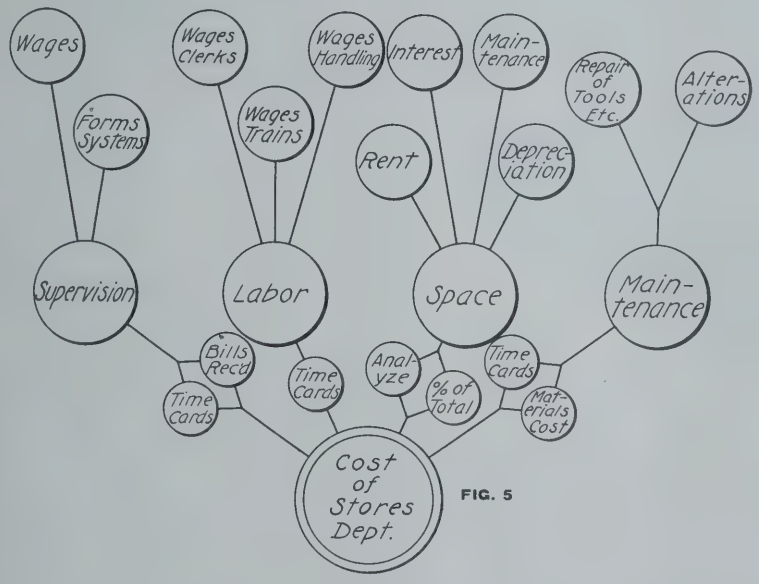

FIG. 5

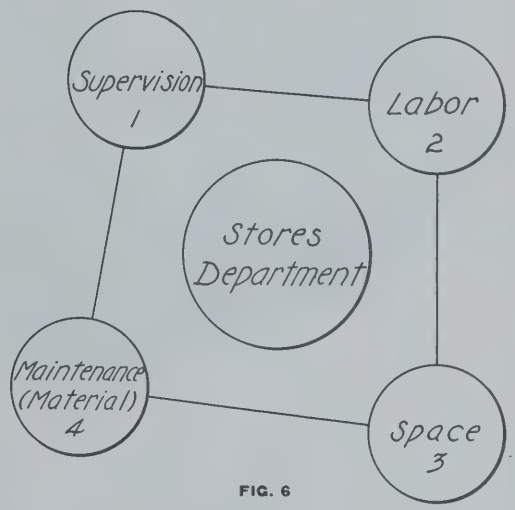

FIG. 6

The accompanying diagrams set forth in concise form the duties of an efficient stores department and the lines along which a practical study of its establishment and operation will proceed. These points should be carefully considered in order that important features be not overlooked and the department become only a makeshift, while it may just as readily be made to serve the full scope of its purpose.

The stores card not only serves to locate materials, but also provides a means for keeping account of the materials on hand and their market or cost value. Each stores card give the name and a brief description of the piece of material; location of stock and the minimum and maximum quantities which may be drawn from it. The material card is used to record the quantity, description and value of the stock on hand at the end of each month. It is filled in at the end of the month by the stores clerk.

In keeping a record of the cost of such a department the diagrams relating to cost factors and accompanying this article will prove helpful.

Figures issued by the United States geological survey for the first six months of 1919, show that zinc produced from domestic ore was 247,584 tons and from foreign ore, 7918 tons, a total output of 255,502 tons, as compared with 260,664 tons in the last half of 1918 and 257,263 tons in the first half of that year. It has been calculated that consumption during the first half of 1919 was 159,501 tons. In addition to

the zinc produced from ore, a bulletin issued by the survey states that 7328 tons were redistilled from zinc ashes, skimmings and drosses. The bulletin further states that many zinc smelters have been dismantled during the last year and a half and many others abandoned. The total number of retorts at plants at which there were some operations during the first half of the year is 158,988, compared with 224,778 on June 30, 1917. The number in operation June 30, 1919, was 82,000 compared with 123,500 at the end of 1918 and 204,500 at the end of 1916.

Develops Porcelain for Industrial Use

ONE of the remarkable achievements attained by British industry under the pressure of war was the application of high class porcelain to laboratory and steel works use. Until the emergency of war intervened British manufacturers had been hesitant in entering the field of industrial porcelain on account of the high reputation then accorded the German product. The annual importation of German laboratory equipment totaled a large amount annually, which was peremptorily stopped by the war.

Because of the special laboratory work which became necessary soon after the outbreak of the war and because of the urgent needs of steelmakers, producers of explosives, and others, a number of porcelain manufacturers of Great Britain turned their efforts toward developing a product of sufficient refractoriness to withstand the exacting demands of pyrometry work.

One of the first firms in England to engage in this work was the Worcester Royal Porcelain Co., Ltd., which until the outbreak of the war had confined its facilities to making high grade porcelain for artistic and domestic purposes. A considerable amount of research work was necessary in order to find material which could be reduced to a perfectly vitrified, nonporous state and which at the same time would be refractory when exposed to high temperatures. It was equally necessary to discover glazes which could be applied to the body material without cracking or breaking during rapid heating and cooling as in the case of pyrometer tubes and other laboratory supplies of this kind. That this company has been successful in its efforts is indicated in a recent report made by Walter Rosenhain, director of the national physical laboratory, Teddington, in which the British-made article was subjected to parallel tests with the porcelain of Berlin. In each case the British product compared favorably with the foreign ware and in many instances demonstrated its superiority. As a result of the success achieved, many British steel works now are using pyrometer tubes, crucibles, capsules, funnels and numerous other laboratory requisites made in the United Kingdom.

FIG. 1 (LOWER)—MEASURING PORCELAIN PYROMETER TUBES
FIG. 2 (UPPER)—MAKING CRUCIBLES FOR LABORATORY WORK

The porcelain is prepared from a combination of china clay, Norwegian felspar, various flints, etc., carefully calcined to get rid of superfluous matter. The grinding alone occupies about 40 hours. Iron and steel particles are extracted from the moisture by magnetic means and powerful cloth and wood presses are used to get rid of superfluous moisture. The mixture is then passed through a sieve of extreme fineness. The baking and glazing operation requires unusual skill and decided accuracy.

In testing the refractory porcelain, laboratory experts decided that the three reagents most likely to attack the porcelain were strong sulphuric acid at the boiling point, a 10 per cent solution of caustic soda at from 90 to 100 degrees Cent. and a 10 per cent solution of sodium carbonate at from 90 to 100 degrees Cent. Each of these tests were continued for four hours. Concentration of the reagent by evaporation was prevented in the last two tests by conducting the experiments in a closed oven. The same volume of liquid was used in each case and the areas wetted were calculated. From these results the amount of material dissolved of 100 square centimeters of wetted surface was determined. In the case of the Berlin porcelain the area wetted was 176 centimeters; the alteration in weight, 0.0016 grams and the loss per 100 centimeters was 0.0009. With the British ware the wetted area was 209 centimeters, the alteration in weight, 0.0016 grams; a gain in this case of 0.0008.

In Fig. 1 porcelain pyrometer tubes are being measured and in Fig. 2 crucibles in progress of manufacture are shown.

A.S.M.E. Undertakes New Work

After Devoting Considerable Attention to Labor Problems, Society Adopts Statement of Principles and Lays Foundation of Machinery For Studying Subject of Industrial Relations—Seven New Officers Elected

ALTHOUGH the subject of industrial relations frequently has appeared on the programs of the past annual meetings of the American Society of Mechanical Engineers, the first definite move committing the society to active participation in the work of studying and helping to adjust present day problems of industrial unrest was taken Thursday at the close of the session of the third day of the fortieth annual meeting at the Engineering Societies' building, New York. From the first day of the meeting, which was unusually well attended, the interest of the majority of engineers centered upon the various phases of the labor problem and continued in increasing intensity until late Thursday when it culminated in formally adopting a statement of principles, authorizing the appointing of a committee to study the agencies of productivity, and taking other action calculated to create the machinery for setting the society to work on the problems of industrial unrest.

At the first session of the meeting, held Tuesday evening in the auditorium, M. E. Cooley, dean of school of engineering, University of Michigan, and retiring president of the society, delivered the annual presidential address. The election of new officers was announced and honorary memberships were conferred or announced. A business session was held Wednesday morning, and in the afternoon simultaneous sessions on appraisal and valuation, aims and organization, and gas power were held. In the evening a meeting was held to commemorate the thirtieth anniversary of the death of John Ericsson and of Cornelius H. D. Lamater, who collaborated with Captain Ericsson in much of his work.

The industrial relations session, which opened Thursday morning, reconvened in the afternoon and continued simultaneously with sessions on machine design, power machinery, and textiles. Three sessions held at the same hour on Friday morning covered transportation, machine shop practice, and general topics. The entertainment features included the annual reunion and dance, held Thursday evening, and numerous inspection trips to points of interest in and near New York.

Urges Employers to End Antagonism in Industry

PREDOMINATING the entire convention and far surpassing any other topic in point of interest aroused, the subject of industrial relations held the attention of an audience which taxed the capacity of the auditorium Thursday morning and after recess discussed various phases of the problem until late in the afternoon in another assembly hall. The discussion was introduced early Thursday by Frederick P. Fish, chairman, national industrial conference board, who delivered a brilliant address on the causes of industrial unrest and their remedy. In introducing this subject Mr. Fish declared that the fundamental difficulties in the present situation are largely historic. Fifty years ago, he said, there were no large industries and inasmuch as almost all employers were in daily contact with their workmen, there were no opportunities for misunderstandings. During the past 50 years this condition has changed with the introduction of power driven machinery, the utilization of electricity, and the organization of large industrial establishments. During the last 30 years, of this half-century, the energies of engineers and employers have been devoted largely to developing mechanical details and the machinery of organization. As a result of this concentration, the United States leads the world in the ability of its manufacturers to organize industry in large units.

However, in devoting their attention to eliminating physical difficulties, the employers neglected the public interest and the subject of employment relations. It is their neglect of these two important factors which has brought on the present situation, emphatically declared Mr. Fish.

Point of View is Wrong

Referring to the part played by politics in the present period of unrest, the speaker stated that the point of view of the government in dealing with workmen has been wrong. Instead of cajoling workmen as has been the practice of the government, labor should have been approached in a manner which would have enabled the two agencies to work in harmony. Admitting that labor unions have done some good, Mr. Fish declared that they have been guilty of the crime of intimidating workmen, appealing to mob rule, disrespecting the law and depressing production. These policies, fostered by labor unions have been the means of accentuating the need of reform and have brought the attention of employers to the subject.

Unfortunately, stated Mr. Fish, labor unions have progressed on the principle that the less work performed the better is the cause of unionism. In the United States unions have not been able to establish the closed shop but in England 90 per cent of the industry was in control of the closed shop. These conditions enabled the average American workman in 1913-1914 to do from three to four times as much as the average English workman. In England, at the outbreak of the war, it was necessary to get the unions to revoke the principle of low production on the promise to return to prewar conditions at the close of the war.

Unionism is not sound because it surpasses production and freedom of contract. The closed shop would be fatal.

There can be no panacea by the way of legislation or of revolution. This was particularly brought out in the recent election in Massachusetts where labor voted for governor-elect Coolidge because of his stand for law and order. This proves, claimed Mr. Fish, that labor is true to the United States when the workmen understand the issue.

Since the present situation cannot be improved by law or by the change in the social structure, employers must instigate the move for reconciliation. Employers must organize their industries so that they can know their employes, learn their aspirations, listen to their complaints, and meet them on terms of equality—but not equality of power and capacities.

Both employers and employes must be taught that no one gains from the suppression of production. There are 450,000 industries in the United States.

Of these 98 per cent are small, and in these plants it is only necessary for employers to understand their men. In the larger plants the problem is an individual one. If employers in large companies devote as much time, attention, and painstaking study to the subject of industrial relations as they do to the mechanical and technical details of business, the present conditions would soon vanish.

The shop committee, claimed Mr. Fish, although new, has great possibilities. Supply and demand never again can be the sole dictator of wages. In the future, capacity, skill, speed, etc., must be factors in determining wages. The proper hours of labor are the longest hours per day compatible with good health. Conditions must govern the hours of work and it is not fair to state that the 8-hour day fits all cases of employment. That the 8-hour day does not satisfy workmen in many cases is proved by frequent strikes in which the strikers demand the opportunity to work overtime.

Cut Unemployment to Minimum

As another means of meeting antagonism, employers must strive to cut down unemployment as much as possible. In time of depression, employers should make every effort to hold their men as long as possible and to keep their heads in time of panic or industrial prosperity. Employment of men must be conducted in accordance with the principle of securing the right man for the right job. An employment department should be inaugurated to intelligently employ men. Employers should take an interest in the permanency of the jobs of their employes.

The recent war showed that organization possessed of the proper spirit of co-operation and teamwork achieves the greatest results. This has been true in all lines of human endeavor and it will prove equally true in industry. Employers must do away with the present antagonism existing in business and must get ready to inoculate the organization in their plants with the healthy spirit of co-operation and teamwork. Mr. Fish expressed the belief that employers now are ready for this movement.

Following the address of Mr. Fish, A. L. DeLeeuw, consulting engineer, New York, presented a paper on wage payment which appears elsewhere in this issue. A paper on systems for mutual control of industry by William Leiserson, formerly chief, division of labor administration, United States department of labor, was read by Calvin E. Rice, secretary of the society. In a noteworthy address on profitsharing, entitled, "What May We Expect of Profit Sharing in Industry?" Ralph E. Heilman, dean, school of commerce, Northwestern university, Chicago, declared that there are great opportunities for profit sharing in industry. He called attention to the fact that the subject of profit sharing has experienced a revival of interest during the past few years. To be successful, profit sharing must justify itself and must show economic results. It is best used in plants where work is not easily measured; as a means for retaining employes and for reducing labor turn-over, and for creating interest and rivalry among men holding managerial positions.

Professor Heilman pointed out that the higher the rank of employes participating in profit sharing, the greater is the opportunity for results. Moreover, in case of business depression the worker in the rank-and-file becomes suspicious when his share of the profit dwindles to a low figure, whereas the salaried man in a managerial position who is familiar with business conditions, thoroughly understands why profits are low and is more likely to do his best to counteract the effects of business depression. According to the speaker, profit sharing for salaried employes above the rank of foreman has unlimited possibilities.

New Officers

President

FRED J. MILLER

Member of technical advisory committee of war claims board, Washington, D. C.

Vice Presidents

JOHN ROBBINS ALLEN

Director research bureau, American Society of Heating and Ventilating Engineers, Pittsburgh.

ROBERT H. FERNALD

Professor of dynamical engineering, University of Pennsylvania, Philadelphia.

EDWARD C. JONES

Chief engineer, Pacific Gas & Electric Co., San Francisco.

Managers

ELBERT C. FISHER

Vice president, Wickes Boiler Co., Saginaw, Mich.

DEXTER S. KIMBALL

Professor industrial engineering, Cornell University, Ithaca, N. Y.

EARL F. SCOTT

President, Earl F. Scott Co., Inc., Atlanta, Ga.

Treasurer

WILLIAM H. WILEY

President, John Wiley & Sons, Inc., New York.

Discuss Shop Committees

Following the talk by Professor Heilman, the meeting was thrown open for general discussion of the subject of industrial relations. George Nicoll Barnes, British representative at the recent international labor conference, Washington, pointed to the fact that the relations between employer and employe today differ from those of years ago in that the average workman is better educated than formerly and has a better grasp of current events. Mr. Barnes stated that employers should study the problem of utilizing to better advantage the intelligence of workmen. He expressed the belief that profit sharing does not appeal to workmen except under certain limited conditions.

A number of interesting types of shop committees were briefly outlined by several speakers at the morning session. According to one speaker fear of unemployment is an important factor in the present labor situation. Harry Alexander, president, Harry Alexander, Inc., New York, in discussing the subject of profit sharing briefly outlined a plan whereby workmen were given a certain rating based upon the following: Loyalty, 60 points; judgment, 15 points; ability, 15 points, and speed, 10 points. Under this system 10 per cent of profits is assigned to the workmen, but efficiency adjustments based on the ratings already mentioned determine the amounts for each. Seventy per cent of the amount devoted to efficiency adjustment is divided among two first rate men; 20 per cent among three second rate men, and 10 per cent among five third rate men. In this manner the flat profit-sharing bonus is diminished or increased by the efficiency adjustment. Mr. Alexander presented slides showing the distribution of profits according to the plan outlined by him.

Foremen Should Be Trained

Owing to the fact that lack of time prevented full discussion of all subjects brought up in the morning session, the industrial relations meeting reconvened in the afternoon. George P. Hemstreet, Hastings Pavement Co., Hastings-on-Hudson, N. Y., declared that engineers must be patient in the present situation. They must teach that production is a basic factor and that no aggregation of capital and no organization of labor can be greater than the government. Because workmen live more closely with their foremen than with any other representatives of employers it is important that foremen know their men more intimately. There should be no excuse, asserted Mr. Henstreet, for a foreman not knowing each of his men by name.

Harrington Emerson, efficiency engineer, New York, discussed the paper on wage payment presented in the morning by Mr. De Leeuw. According to Mr. Emerson, it is not feasible for employers and employes, especially in units as organized today, to fairly arbitrate their differences. Each party cannot help but feel that the other is intent upon driving a hard bargain. What is needed, declared Mr. Emerson, is a referee eminently

qualified to decide what is just. Under the present conditions there is no adequate unit of measurement and labor and capital in compromising usually do so at the expense of the public.

Another speaker called attention to the fact that distribution of goods is a factor which should be considered in conjunction with the present industrial situation. He advocated the establishment of a system of priority similar to that employed during the war which would prevent the waste effort now devoted to unessential industries.

Following this discussion, L. P. Alford, chief of staff, *Industrial Management,* again brought to the attention of the meeting a resolution which had been tabled at the early morning session. Mr. Alford explained that the document, which appears elsewhere in this article, was formulated by the New York section of the society after considerable discussion. Its adoption by the section was unanimous and it was submitted to the council of the society, which suggested that it be presented to the society at large. Following the motion a lively debate ensued, which continued until late in the afternoon. A number of speakers objected to the statement of principles on the ground that a number of terms in the last two paragraphs are vague and misleading. A number of queries were made regarding the real definition of the expression "credit capital" and a number of speakers requested an explanation of the term "intrinsic law."

The discussion was marked by considerable emphasis on detail and it was at all times apparent that with one exception all persons participating in the discussion were in hearty accord with the principles involved. It was only after the statement in question was carefully explained and questionable phrases satisfactorily amplified that the original motion, stripped of its numerous amendments, was brought to vote. Closely following the passing of this motion, another was introduced authorizing the council of the society to appoint a committee to be known as the committee on agencies of productivity to study the following: Invested savings, credit capital, organized labor, unorganized labor, employers, managers, society as a whole, and economic and productive intelligence service. This motion was quickly carried and immediately following it, another resolution committing the society to ground work plans for undertaking the task of thoroughly investigating the subject of industrial relations was considered and adopted.

Among those who participated in the discussion relative to these three motions and who were largely instrumental in passing them were E. S. Carman, chief engineer, Cleveland Osborn Mfg. Co., Cleveland; Harrington Emerson, efficiency engineer, New York; Robert Thurston Kent, New York; Frank B. Gilbreth, president, Frank B. Gilbreth, Inc., Providence, R. I.; Ira N. Hollis, president, Worcester Polytechnic institute, Worcester, Mass., and A. Ferguson, New York, who was largely resonsible for a part of the resolution adopted by the New York section.

Read Many Technical Papers

MANY different topics were discussed in the eight sessions devoted to technical subjects. Wednesday afternoon at a joint session with the American Society of Refrigerating Engineers, methods of appraisal and valuation were discussed. David H. Ray, director of laboratories, United States signal corps school, New York, presented a paper on appraisal and valuation methods in which he pointed out the injustice of some methods of valuation of public utilities now employed. M. E. Cooley, retiring president of the society, read a noteworthy paper on "Development of Project," written by the late F. B. H. Paine. In this paper the author shows that the development of project involves the conception of plan, determining of scope, preliminary design, estimate of operating expense, prospectus, development of financial plans, legal considerations, negotiations with banks and negotiations with state or other government for franchises, etc. Dean Cooley also read an abstract of a paper on "The Construction Period," by H. C. Anderson, University of Michigan, Ann Arbor. In an unusually comprehensive paper dealing with price levels and values, Cecil Elmes, Sanderson & Porter, Chicago, emphasized the importance of a knowledge of economic and exchange values for engineers. Mr. Elmes illustrated his discussion by a number of interesting charts showing comparisons of price levels and values during several critical periods in the

State Engineers' Creed on Industrial Relations

FOLLOWING is the text of the declaration of the engineers' view covering the industrial relations situation formulated by the New York section of the American Society of Mechanical Engineers and adopted by the society Thursday after an all-day session devoted to the subject of labor, employment and profit sharing:

Social and industrial unrest result from the fact that human relations have not kept step with economic evolution.

Competent directive management of essential enterprises is the logical solution. Such management must be free from autocratic control, whether by capital or by labor.

Sharp social or industrial disputes are no longer private. Society is affected, therefore such cases must be subject to the decision of authorities based upon intrinsic not arbitrary law.

Industry and public utilities must serve the people. There is no room for special privilege of capital or of labor. Strikes, irregular employment, or arbitrary acts of ownership or of management are harmful, not alone to the immediate parties but to society as a whole.

Productivity and public service are absolutely essential.

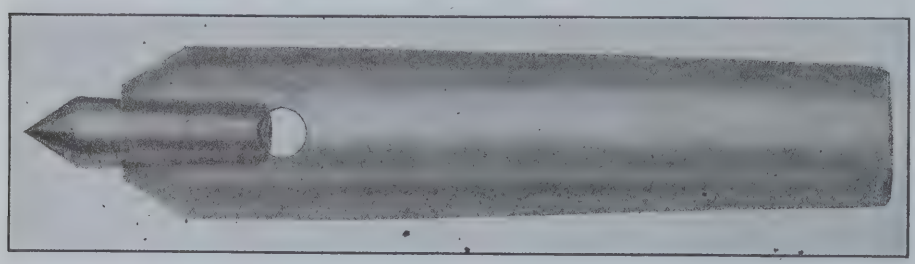
On account of the peculiarly intimate familiarity of engineers with industrial problems our responsibility is great.

Therefore, we, engineers and members of the American Society of Mechanical Engineers, declare that the following essentials are established by facts and experience, urge all of our members to uphold them, and invite other engineers to co-operate with us in having them unanimously recognized; namely:

EVERY important enterprise must adopt competent productive management, unbiased by special privilege of capital or of labor, and disputes must be submitted to authorities based upon intrinsic law.

Credit capital represents the productive ability of the community and should be administered with the sole view to the economy of productive power, that is, it should be granted only to those who are able to render valuable service.

financial history of the United States.



A session on gas power was held simultaneously with the session on appraisal and valuation. E. B. Blakely, engineers, Sears, Roebuck & Co., Chicago, presented a paper describing the Hvid engine, a recently developed internal combustion unit which uses kerosene for fuel. Mr. Blakely claimed that this engine is particularly economical in the use of fuel and points out that this is important at this time when it is estimated that there are in use in this country burning gasoline nearly 4,000,000 automobiles, 250,000 trucks, 500,000 motor boats, 75,000 tractors and 750,000 farm engines.

Thursday afternoon sessions were devoted to machine tool, power machinery and textiles. The final sessions of the convention, held Friday morning, covered transportation, machine shop and general engineering topics. At the machine shop session, H. R. Trotter, S. K. F. Ball Bearing Co., Hartford, Conn., presented a paper on the lubrication of ball bearings, an abstract of which appears in this issue. H. L. Unland, General Electric Co., Schenectady, N. Y., gave an illustrated talk on electric arc welding; C. H. Bierbaum, Lumen Bearing Co., Buffalo, read a paper dealing with common errors in designing and machining bearings; and B. F. Waterman presented a paper on "Thread Forms for Worms and Hobs."

At the general session W. E. Moore, W. E. Moore & Co., Pittsburgh, spoke on modern electric furnace practice as particularly related to foundries, and Alfred Musso, the Coast Cooling & Engineering Co., New York, presented a paper on an investigation of the strains in the rolling of metal. An abstract of Mr. Moore's paper appears elsewhere in this issue, while Mr. Musso's paper was reproduced in the issue of Dec. 4.

Confer Honor on French Engineer

The first session of the annual meeting was held Tuesday evening in the auditorium. M. E. Cooley, retiring president, delivered the presidential address in which he dwelt largely with problems confronting the society. The electing of new officers, as shown in an accompanying table, was announced. Honorary membership was conferred upon Charles de Freninville, consulting engineer, Creusot works, France, and announcement was made of the election to honorary membership of Auguste C. E. Rateau, chairman, board of directors, Rateau, Battu & Smoot Co., France. M. de Freninville has taken a prominent part in engineering in France. In response to the address made when honorary membership was conferred upon him, he stated that the world looks to America for vast production. "On my recent tour of the country," he said, "I have seen great industrial plants which have been created by the war and I saw evidences of the ability of the American people to produce manufactures of all kinds, in large quantities. Although we regard the United States is a great producing nation, a large output is not inconsistent with the highest mechanical skill. With the advantage of efficiency, machinery, and high grade tools American industrial plants are in a position to produce on a large scale, and this can be done by paying moderately high wages."

THE HIGH-SPEED STEEL CENTER MAY BE REPLACED WITHOUT REMOVING THE SLEEVE

At Wednesday morning's business session the report of a joint conference committee representing the societies of civil, mining, mechanical and electric engineers was discussed. The report favors a general organization of engineers for public activities. Shortly before the war the four engineering societies organized the engineering council, a body which has represented the entire engineering profession in its public relations. It is now proposed to extend the scope of that council by creating a national organization by which the engineering and allied technical professions may become more active in their service to the public. Among the objects to be obtained are the licensing of engineers, the forming of a national service committee, the forming of a national department of public works, the conservation of national resources, and an international affiliation of engineers.

At the memorial meeting held Wednesday evening to commemorate the eightieth anniversary of the beginning of Capt. John Ericsson's work in this country, addresses were made by Rear Admiral Bradley A. Fiske, United States navy; W. A. F. Ekengren, minister to United States from Sweden; Lewis Nixon, commissioner of public works, borough of Manhattan, New York, and H. F. J. Porter, consulting engineer, New York. Speaking of the work of Ericsson, Rear Admiral Fiske said: "Weighed in the light of the results that followed, the MONITOR stands out as not only the greatest of Ericsson's achievements but as one of the greatest achievements in the progress of the human race."

Preceding the annual reunion and dance held Thursday evening, lectures on phases of aviation were delivered by Col. E. A. Deeds, chief of equipment, division of air service; and Col. Thurman H. Bane, chief of engineering division of air service, United States army. Colonel Deeds, under whose personal direction the Liberty engine was developed, spoke on the future of aviation and Colonel Bane, who is the commanding officer at McCook field, spoke on the present development of military airplanes.

During the convention a number of members and guests of the society took advantage of inspection trips to points of interest in and near New York, including the Seventy-fourth street plant of the Interborough Rapid Transit Co., the Equitable building and power plant; Brooklyn navy yard; and plant and flying field of the Curtis Airplane Co., Garden City, L. I.

Machine Tool Center Has Replaceable Point

A new center for lathes, milling machines, gear cutters and grinders has been made by the Federal Steel Co., Detroit, and consists of a high-speed steel center or point and a hardened steel sleeve. The sleeve which acts as a holder is permanent and is not subject to wear, it holding the center securely in a tapered hole.

The advantages claimed for the new center are that the high-speed steel point can be changed in about 10 seconds without removing the sleeve from the tool and that the cost of a new point is comparatively low. Being made of high-speed steel, the centers do not readily burn or wear off. The sleeves are supplied ground to any of the standard tapers.

Under the name of the Springfield Cylinder Regrinding & Piston Works, H. C. Wisenburn, of Mittineague, Mass., has started business at 343 Walnut street, Springfield, Mass.

Steel Exports Continue Decline

October Tonnage Falls to Low Figure After Slump in September—Pig Iron Exports Are Lowest Since April, 1918 as Result of the Steel Strike —Imports Also Show Falling Off

CONTINUING the slump of September, exports of iron and steel in October fell to the second lowest figure on record for this year, the tonnage for July having set the mark of smallest volume. Although a gain in imports was noticed in September when exports fell, the former also declined during October but not in an appreciable amount. Imports for the month, in fact, were the second largest during 1919, the tonnage of the previous month having set the highest figure since April, 1917.

October exports totaled 302,459 gross tons, a loss of 61,072 tons over the September shipments of 363,531 tons, and a decrease of 16.8 per cent. The latter is just double the percentage decrease of September over August. Compared with the record movement of December, 1917, when 653,344 tons were exported, the October figure represents but 46.3 per cent. Although gains were made in wire rods, structural iron and steel, hoops and bands, ship and tank plates, and barbed wire, the only one of significance was that in structural material which increased from 21,933 tons to 26,641 tons, a gain of 4798 tons. All other products suffered losses, the most severe being in steel billets, ingots and blooms, pig iron, steel rails and sheets and plates. Because of decreased blast furnace output on account of the steel strike pig iron exports with 14,108 tons reached the lowest figure since April, 1918.

Imports with a total of 40,698 tons showed a decrease of 2869 tons over the September figure of 43,567 tons. Several small gains were registered but a large loss in scrap was responsible for the decreased total. The scrap loss was 4995 tons.

Iron ore imports also dropped sharply with a total of 30,386 tons

Basing Point Finding Far Away

Drawn-Out Procedure is Indicated as Federal Trade Commission Hears Arguments For and Against Pittsburgh Base on Iron and Steel—Duluth and Birmingham Support Chicago's Claims for Recognition

WASHINGTON, Dec. 9.—Months, some say years, will pass before the federal trade commission will make known its decision on the applications of steel consuming interests for elimination of the Pittsburgh base in determining the delivered price for steel. In the week just passed the commission heard 19 hours of arguments evenly divided for and against the trade practice. Under the laws governing the activities of the commission, the investigation of the subject from now on will be conducted privately and not until after the commission has formally decided to issue a formal complaint against steel producers, taking up the cause of the complaining consumers, will any of its future actions be taken publicly.

Last week's course, like practically every step before the commission so far in connection with the basing point case, was somewhat unusual in that the doors were open for any and all interests to be heard. When the hour for hearing arrived Tuesday, Nov. 2, Claude R. Porter, chief counsel for the commission, met the steel producers, the consumers and their counsel, and informally arranged to divide the time so that each side would have ample opportunity to be heard. After this was done the commissioners, who were engaged in another case, received the groups and, with slight modifications, approved the arrangements. Arguments, more or less informal, began that afternoon and continued daily until one o'clock on Saturday afternoon.

John S. Miller, counsel for the Western Association of Rolled Steel Consumers, was selected as chief spokesman for the applicants and, to the surprise of the steel manufacturers and their counsel, announced that the Birmingham and Duluth interests had joined the Chicago consumers in asking for the elimination of the Pittsburgh base and would not ask for the establishment of separate bases at Duluth and Birmingham. Later, in the course of the arguments, it was practically agreed that an order of the commission stopping the trade practice of basing prices at Pittsburgh would have the effect of making prices f.o.b. mill and during the remainder of the hearing this basis of argument was employed. The trend of the arguments, while friendly and good natured, brought out sharply conflicting theories of economics, the question being, of course, whether continuance of the trade custom or its elimination would be best for the national interest. This, as is recognized, is the point the commission has been asked to determine and large as the question is, with all its ramifications, it is apparent that much time will be required for a full investigation into the claims set up by both those favoring and opposing the practice.

When arguments were concluded last Saturday the case automatically went from the personal attention of the commissioners to that of M. F. Hudson, acting chief examiner. Under his direction every phase, and perhaps more, brought out by the hearing last week will be studied from all angles. It is likely examiners will go into every important, and perhaps some remote, steel-producing and consuming centers and into other trade points where similar trade practices are effective. This will take months and in the end what Mr. Hudson and his examiners discover will be submitted in a complete report to the commission's board of review.

This board, composed of an econo mist and two attorneys, of whom Adrian S. Busick is chairman and the other two are T. M. Robertson and W. T. Roberts, will act upon the examiners' report and submit it to Huston Thompson, the commissioner to whom, under the rules of the commission, the case has been assigned. With the report the board will submit a recommendation of what it believes should be done, but Commissioner Thompson is not bound to follow the recommendation in writing his opinion. This opinion, together with all data in the case, then goes before the commission which, to reach a satisfactory conclusion, may call in the board of review, voting in the end, the majority of the commissioners ruling, whether to issue a complaint and to determine against whom the complaint will be issued.

If no complaint is issued the case, will be dropped and the basing point custom will remain as it is today or, as argued by the counsel for the steel producers, until the natural laws of economics, which they said meant the growth of the Chicago producing district until it is the controling factor in the market, bring about other arrangements. If a complaint is issued, then again months will pass before an order is entered, either dismissing the

Procedure Outlined

WASHINGTON, Dec. 9.—The government's own statement of the procedure in the enforcement of the rules of law declared in both the federal trade commission act and the Clayton act, under which the steel consumers charge the producers with violations in maintaining the Pittsburgh base in establishing prices, is as follows:

"Whenever the commission has reason to believe that any person, etc., has been or is using unfair methods of competition and that a proceeding by the commission would be in the public interest, or is violating or has violated any of the aforesaid provisions of the Clayton act, it shall serve a complaint, with notice of hearing, upon such prices, etc., who shall have the right to appear and show cause why an order should not be made requiring the cessation of the violation of law charged. Other parties, for good cause shown, are allowed to intervene in the proceeding. On hearing had, if the commission shall be of opinion that a violation of the law is shown, it shall serve an order on the person complained of to cease and desist. If such person fails to obey the order of the commission, the latter may apply to the circuit court of appeals to enforce the same, and file a transcript of the record in the case. The court shall then take jurisdiction of the proceedings and have power to affirm, modify or set aside the order of the commission, but the finding of the commission as to facts, if supported by evidence, shall be conclusive. If the court permits additional evidence to be adduced it must be taken before the commission. The only review of the judgment and decrees of the court is by writ of certiorari to the Supreme Court, as provided by law. Any party required to cease and desist from a violation of law may obtain a court review in a similar manner."

complaint or compelling the steel manufacturers to "cease and desist." If the steel people refuse to obey the order the commission may take the case to the circuit court of appeals or if the steel producers prefer, they may make the appeal. From then on the matter is one for the courts.

The arguments made before the commission last week largely were along the lines of the complaints and statements made in the applications and answers filed by the consumers and producers at the invitation of the commission following its conference here last July with E. H. Gary, chairman of the United States Steel Corp., and Judge Miller, representing the western consumers. Opportunity was given for refutation of the charges and countercharges made by either side and this was readily taken advantage of. The commissioners themselves raised point after point as the hearing progressed and much of the questioning and summing up was admitted by counsel of both sides to have helped the presentations.

Those Who Argued Case

Except for two others, who spoke briefly in rebuttal for the complainants, Judge Miller at noon Saturday concluded the arguments in the case. Besides Judge Miller those spokesmen who pleaded for the removal of the trade practice were H. G. Pickering for the Superior Commercial club; Clifford L. Hilton, attorney general of Minnesota; T. T. Hudson, for the joint committee of civic organizations of Duluth; Elliott Cheatham, for the Southern Association of Rolled Steel Consumers and the Southern Association of Steel Fabricators; Charles L. Harold, secretary-manager of the Birmingham Civic association; and others, including George M. Gillett, president of the Minneapolis Steel & Machinery Co.

Richard V. Lindabury, counsel for the United States Steel Corp., opened the argument for the steel producers and was followed in turn by Henry Russell Platt for the Inland Steel Co., Frank H. Scott for the Steel & Tube Co. of America, L. A. Manchester for the Youngstown Sheet & Tube Co., C. W. Wickersham for the Lackawanna Steel Co., Paul D. Cravath for the Bethlehem Steel Co., W. A. Collings of the W. A. Collings Co., Kansas City, Mo.; James Bowron, president of the Gulf States Steel Co., and John Walsh, counsel for the Petroleum Iron Works Co. Other interests were present and represented on both sides, but the speakers were authorized to present the respective arguments of all on either side.

Arguments against the basing point were based chiefly on the theory that it is an arbitrary factor in the delivered price quoted at points where delivery requires less or no freight haul than from Pittsburgh and that by reason of that fact a large number of steel consumers are forced to pay considerably higher prices for their steel at those points than are their competitors situated closer to Pittsburgh. Elimination of this point, it was contended, would, by virtue of the demand in the Chicago district, and lower operating costs, attract producers to Chicago, perhaps to the detriment of Pittsburgh, but in response to a natural, unrestrained economic law.

Opponents of the elimination plea contended that most if not all of the Chicago producers now located there established their plants in and around that point not only because of the low cost factors, but largely because the market price in Chicago is Pittsburgh plus freight, which, also under economic laws, is a natural advantage to producers at Chicago. The opposing sides, by these arguments, brought in conflicting laws, each of which, according to the view, was the natural one and the one which should not be disturbed. It was left to the trade commission to determine which, in its opinion, is the proper one.

The steel producers' counsel stated producing mills and consuming plants have been built because of certain advantages, either the proximity of raw materials or of finished material markets, freight hauls, labor, fuel, and other factors. The consumers admitted this, but pointed out that the increase in freight rates, for example from $2.60 per ton on steel several years ago, to $5.40, at present, Pittsburgh to Chicago, restricts the territory of their output, as far as competing with fabricators in the Pittsburgh district is concerned. The real reason for the complaint, counsel for the steel producers explained, is a natural desire by all consumers for a lower price on steel and that while it may or may not reduce the cost to the manufacturing consumer, it would, if a reduction did come, go into the pocket of the fabricator and not the ultimate consumer's.

Should Serve Public Interest

The public interest in the question is a point on which the applicants dwelt with much emphasis. They argued the commission should consider this. This, the opponents of the elimination plea admitted, is of vital public interest, but, they pointed out, the public interest will be served best by a stability the basing point custom gives than by the confusion they contend will follow its elimination. The applicants charged the "stability" desired by the steel manufacturer is that of price, while counsel for the producer maintained stability of conditions in the industry is what gives and what is wanted. One of the counsel for the producers said "Pittsburgh plus freight" is to the steel trade, both producer and consumer, what the shock absorber is to the automobile.

Problem is Intricate One

It was clear as argument progressed on both sides that the deeper the commission delved into the subject the more intricate it became. The trade practices in marketing wool, cheese, butter wheat, flour and other commodities were cited by counsel and the commissioners themselves and it was stated by some that when the issue is to be finally determined the commission may have to decide for other industries as well as for steel. It may be, one member explained privately, that the commission's private examination into the question may have to take in the other industries even now in order to settle the question justly.

While Commissioner Thompson has been assigned the basing point case for his personal supervision, Victor Murdock, chairman, and William E. Colver, commissioner, sat with him during the week's arguments. The day following Mr. Murdock's elevation to the chairmanship, succeeding Franklin Fort, who resigned because of illness, Mr. Fort, appearing very wan and fatigued, sat with the commission for a few minutes. The entire group of producers, consumers, counsel, etc., arose out of respect when he entered the room.

The board of review, which will pass upon the basing point case before it again reaches the commissioners, is composed of two attorneys and an economist, of whom Adrian S. Busick is chairman. The others are T. M. Robertson, economist, and W. T. Roberts. W. R. Turner is the attorney assisting the board which will also have the help of Dr. Francis Walker, chief economist of the trade commission, whose investigations in the steel cost question are more or less familiar to the steel industry.

Among those attending the argument sessions were Willis L. King, vice president, Jones & Laughlin Steel Co.; G. H. Jones, vice president, the

Inland Steel Co.; James B. Bonner of the United States Steel Corp.; T. K. Glenn, president of the Atlantic Steel Co.; C. R. Robinson, vice president, Lackawanna Steel Co., and others, including presidents and officials of the companies which are members of the complaining associations.

Bureau Would Extend Studies of Steel

WASHINGTON, Dec. 9.—Director Van H. Manning, of the bureau of mines, in his annual report expresses the hope that congress will provide funds enough to enable the bureau to investigate iron and steel problems at its Pittsburgh station. It is pointed out that Pittsburgh is one of the great iron and steel centers of the world and that whenever the necessary funds are made available many lines of investigation can follow with results that should be of much benefit to the industry. The director says the iron industry covers a wide field and has devoted much research to the many problems within its field, hence the bureau of mines has not felt that the problems of iron and steel manufacture demanded as much attention as those of mining or of other metallurgical work. It has investigated the hazards to which workmen are exposed at blast furnaces and steel plants, it is stated, and has published the results of investigations and now it is desired to take up at the Pittsburgh station the work suggested.

Dealing with iron ores, the report says there are deposits throughout the United States which are too low grade to permit profitable smelting at present. If these low-grade deposits could be utilized, Director Manning says, the iron ore reserves of the country would be enormously increased. In order to obtain the iron from these ores the opinion is expressed that it is necessary to do one of two things: (1) Remove enough of the gangue material and impurities to bring the iron content up to the percentage required for profitable smelting, or (2) devise a commercial process for treating ores of lower grade than those being treated by present blast furnace methods.

Work on Ore Beneficiation

At present the bureau's metallurgical work on iron is centered at the Minneapolis station and is being conducted in co-operation with the school of mines, University of Minnesota, and the state mining experiment station. Individuals and corporations are said to have given attention to the beneficiation of iron ores high in phosphorus and sulphur, as well as low in iron, and at least one process has been devised that promises to be highly successful in raising the iron content and removing the phosphorus. Because of this fact, and because the work done by the Minnesota mining experiment station promises to solve the problem of washing and concentrating low grade minable ores, the bureau of mines has not attempted to begin any work on the beneficiation of low grade ores, but is giving its attention rahter to the devising of commercially feasible processes for reduction of those iron ores that are too low grade for blast furnace smelting. Evidently, it is stated, the development of successful processes for the beneficiation of low grade iron ores will assist in solving the second phase of the problem, for an ore might be too low grade for blast furnace smelting, but after beneficiation be high enough in iron for reduction by some other process. Hence, the bureau believes it is justified in studying ways and means of preventing metallic waste, in giving especial attention to new processes for the production of iron, and investigating the merits of processes already suggested.

Manganese investigations showed that in time of war a large part of the manganese needed in this country could be obtained from domestic ores, reductions in imports being met by the development of new deposits of high-grade ore, by the beneficiation of low-grade ores, and by the use of low-manganese alloys made from these leaner ores. A comprehensive bulletin on manganese, its utilization, treatment of its ores, and mining costs is in press.

Coal Crisis Demands Policy of Wisdom

—Secretary Lane

WASHINGTON, Dec. 8.—Able and timely analyses and suggestions are made by Secretary of the Interior Franklin K. Lane in dealing in his annual report with coal, electricity, and petroleum, as the three sources of light, heat and power, and the need for constructive policies affecting their production and distribution. Secretary Lane goes into these intricate problems from both a practical and scientific viewpoint and treats of the fundamentals they involve in a most illuminating way comprehensively pointing out remedies some to come through legislation the adoption of which ought to prove a great boon to industry in assuring more efficient operation, conservation and the averting of such crises as that caused by the coal strike.

Summarizing his report on the three vastly important commodities mentioned, he says:

"It would seem to be our plain duty to discover how little coal we need to use. To do this we must dignify coal by grading it in terms not merely of convenience as to size, but in terms of service as to its power. We should save it, if for no better reason than that we may sell it to a coal-hungry world. We should develop water power as an inexhaustible substitute for coal and if necessary compel the coordinating of all power plants which serve as a common territory. New petroleum supplies have become a national necessity, so quickly have we adapted ourselves to this new fuel and so extravagantly have we given ourselves to its adaptability. To save that we may use abundantly, to develop that we may never be weak, to bring together into greater effectiveness all power possibilities—these would seem to be national duties, dictated by a large self-interest."

The report begins with a discussion of the coal strike immediately after the statement that there will be a reaction against the intense industrialism of the present, "but as it must be agreed that the race for industrial supremacy is on between the nations of the world, America may well take stock of her own power possibilities and concern herself more actively with their development and wisest use."

Secretary Lane explains that "the coal strike has brought concretely before us the disturbing fact that modern society is so involved that we live virtually by unanimous consent." Less than one-half

of 1 per cent of the population of the country, it is shown, quit their work of digging coal "and we are threatened with the combined horrors of pestilence and famine." Showing what might be the state of the country in another 30 days, Secretary Lane inquires as to what is the best way of meeting the situation, seeking to learn how much coal is mined, by whom, its quality, uses, its users, how much less could be mined if conservation were practiced, what better methods have been developed for using coal, who is to blame that so small a supply is on the surface, why people should live from day to day in so vital a matter of fuel supply, and what substitutes can be found for coal and how quickly these may be available.

He makes replies to his own queries, once he has stated that if coal operators themselves had not carried over the statistical machinery developed during the war, "we would have been forced to the humiliating confession that we did not know facts which at the time were of the most vital importance."

More Knowledge is Needed

In a time of stress, it is stated, it is not enough to be able to say that the United States contains more than one-half of the known world supply of coal; that we, while only 8 per cent of the world's population, produce annually 46 per cent of all coal that is taken from the ground; that 35 per cent of the railroad traffic is coal; that in less than 100 years we have grown in production from 100,000 tons to 700,000,000 tons per annum. He says that months since congress was called upon to grant the money that the desired figures might be secured, a committee of the senate finally awoke to this need and indorsed the petition. Secretary Lane states that it is necessary for national stock-taking and that it need excite no fear of a malevonent policy of "conservation," because what is desired is a policy of wisdom in order to know our resources, their availability for immediate use, guarding against waste either through ignorance or wantonness and the prolonging of their life by invention and discovery.

The present strike, makes quite clear, perhaps for the first time, that it is not the coal in the mountain that is of value, but that which is in the yard.

Secretary Lane points out that large storage facilities have not been provided, and says a bit more foresight on the part of the public would certainly have made less sudden the present crisis. He goes into the short work-year of the miners and the reasons therefor, chief of which is "no market" and says the public must accept responsibility for the coal industry and pay for carrying it on the year around.

Secretary Lane says the government should sample and certify coal, so the public would know the kind of coal it is buying and so that coal should sell in terms of capacity to deliver heat. A bill to effect such fuel inspection, it is stated, has been drafted and will be presented to congress.

Taking up the question of saving coal by saving electricity, Secretary Lane says it is three years since congress was urged "that we should be empowered to make a study of the power possibilities of the congested industrial part of the Atlantic seaboard, with a view to developing not only the fact that there could be effected a great saving in power and a much larger actual use secured out of that now produced, but also that new supplies could be obtained from both running water and from the conversion of coal at the mines instead of after a long rail haul. A stream of power paralleling the Atlantic from Richmond to Boston, a main channel into which may run many minor feeding streams, and from which diverge an infinite number of small delivering lines—the whole an interlocking system that would take from the coal mines and the railroad a part of their present burden and insure the operation of street lights, street cars, elevators and essential industries in the face of railroad delinquencies—this is the dream of our engineers, and a very possible dream it has seemed to me; of such value, indeed, that we might well spend a few thousand dollars in studying it, not with the thought that the government would construct or operate even the trunk line, tion of the engineering and financial but that it might so attract the attenworld as to make it a reality."

After reciting accomplishments of other nations in this district, Secretary Lane says the theoretical maximum quantity of hydroelectric power that can be produced in the United States has recently been estimated by Dr. Steinmetz, who calculates that if every stream could be fully utilized throughout its length at all seasons, the power obtained would be 230,000,000 kilowatts (320,000,000 horsepower). It is clear, Secretary Lane adds, that only a fraction of this absolute maximum can ever be made available. He states that the geological survey estimates that the water-power in this country that is available for ultimate development amounts to 54,000,000 continuous horsepower. The census of 1912 showed that the country's developed water power was 4,870,000 horsepower, about 9 per cent of the maximum power available for economic development and less than 2 per cent of the total that may be supplied by the streams as estimated by Dr. Steinmetz.

Alexander's Appointment, Cause of Surprise

Washington, Dec. 9.—The senate is expected to confirm without any debate the action of the President in nominating Representative Joshua W. Alexander as secretary of commerce to succeed William C. Redfield. His nomination came as a surprise and set at rest reports that the President intended to name a business man for the position. Mr. Alexander has expressed reluctance at leaving congress, but said he would resign as soon as the senate had confirmed his nomination. Mr. Alexander has been a member of congress since 1904 and became chairman of the committee on merchant marine and fisheries in 1910.

Nelson B. Gaskill, Burlington, N. J., was nominated as a member of the federal trade commission to succeed Chairman J. Franklin Fort, who resigned owing to illness. Victor Murdock, who has been vice chairman, has automatically become chairman.

Edgar E. Clark, of Iowa, has been renominated as a member of the interstate commerce commission.

Palmer's Attitude Wins Foundrymen's Approval

Washington, Dec. 9.—Commendation of Attorney General Palmer for his attitude toward radical labor is carried in a resolution adopted by the National Founders' association at New York, Nov. 20, and which was presented through a committee from the association.

The resolution follows:

Whereas, the forces of unrest in this country, fostered by alien propaganda and abetted by union labor leaders of radical tendency, are at this time seeking the overthrow of the government of the United States, and, as a means to that end, are attempting to crush industry through widespread strikes and monopolies of labor, and

Whereas, it is fitting that all loyal citizens give encouragement by word and deed in its stand against such lawless acts,

Resolved, that we, the National Founders' association, in convention assembled, do renew our allegiance to the principles embodied in the constitution and laws of our country and do pledge ourselves to assist the government in its efforts to suppress sedition and disorder;

Resolved, further, that we, as citizens, express our deep debt of gratitude to A. Mitchell Palmer, attorney general of the United States, for his timely effort and loyal and courageous action in defense of American principles and against the disloyal and unlawful activities of the United Mine Workers of America and their allies.

Here and There in Industry

Live Information Which Records the Expansion of Various Lines of Productive Enterprise

THE Reading Iron Co., Reading, Pa., manufacturer of wrought iron pipe, has been reorganized under the direction of President Leon E. Thomas. A notice of Mr. Thomas' election with a sketch of his business career was published in the March 27 issue of THE IRON TRADE REVIEW. W. Woodward Williams, who as noted in the July 24 issue of this publication, was appointed general manager of the company, succeeds George Schuhmann, who retired Aug. 1, because of ill health. The appointment of Craig Geddis as advertising manager and W. E. Dunham as production engineer, was noted in this column under date of Oct. 30. Edgar F. Blessing is metallurgical engineer.

Purchases by the company include the plant of the George B. Lessig Co., Pottstown, Pa., bringing an additional monthly muck bar capacity of 2600 tons, and 10 acres of land adjoining its tube works have been bought from the Empire Steel & Iron Co.

Important changes have been made in the sales policies of the Reading company. Branch offices for district sales representatives have been established at Philadelphia, New York, Pittsburgh, Chicago, Cincinnati and Dallas, Tex. Additional branches which now are being located, will be established in the near future.

* * *

UNDER the direction of John O'Brien and David Goldich, the Universal Bearing Bronze Co., Windsted, Conn., has started the manufacture of aluminum castings, rough and finished, in a portion of the old Goodwin & Rintz factory buildings.

* * *

TO DOUBLE its capacity the Iowa Steel & Iron Works, Cedar Rapids, Iowa, has added a new foundry building. This covers a space 72 x 140 feet, and has been equipped with up-to-date machinery. In addition several modernizing changes are being made in the office.

* * *

A HALF million dollar syndicate is being formed in Cleveland to underwrite stock of the Murray Ohio Mfg. Co. The J. W. Murray Mfg. Co. of Detroit, said to be the largest manufacturer of hoods, fenders and sheet metal parts for motor cars recently announced its intention of establishing a plant in Cleveland.

* * *

THE Model Yacht Co., Worcester, Mass., a $10,000 Massachusetts corporation, has been organized for the construction of toy ships. Henry H. Forbes is president, treasurer and general manager, with Floyd A. Ramsdell, general manager of the Worcester Film Corp., and Linwood M. Erskine, attorney, directors. The company has been organized to fill a growing demand for toy boats formerly supplied by Germany.

* * *

ORGANIZED by Frederick C. Van Derhoof, formerly general manager of the automobile department of the Standard Steel Car Co., Butler, Pa., the Bacon Motors Corp. has a capital of $1,500,000. It will build a light 6-cylinder automobile, which will be marketed next spring at a low price. The company has acquired a 21-acre site at New Castle, Pa., and a new factory, 100 x 500 feet. H. L. Archey, Philadelphia, has been named sales manager.

* * *

ANNOUNCEMENT is made of the organization of the Miller Mfg. & Machine Co., of Centralia, Wash., where the company has opened a plant at 616 North Tower avenue. W. J. Miller is president, J. G. Jones secretary and treasurer, L. B. Jones general manager and C. S. Sheldon manager. The company will have a completely equipped shop to do mill and automobile machine work, grinding cylinders, will make high-speed piston rings, and do oxy-acetylene welding.

* * *

THE largest structural job awarded in Milwaukee in several years, involving 4500 tons of shapes, was let during the week by the A. O. Smith Corp. to the Worden-Allen Co., which is now completing the erection of a 600-ton building for the same interest. The new letting is for the second unit of a plant enlargement project by which the Smith Corp. will add 400,000 square feet of manufacturing space at an estimated cost of more than $3,000,000, including a large list of machine tools and other equipment.

* * *

PROPERTY, 356 x 600 feet, in Evanston, Ill., has been purchased by the International Lubricants Co., Ltd., 350 North Clark street, Chicago. It adjoins the Mayfair cut-off of the Chicago-Northwestern railroad. The first unit of a 3-story brick and concrete building, 50 x 100 feet, now is nearing completion. All equipment, machinery, storage tanks, pumps, etc., rapidly are being installed, with the expectation that the manufacture of lubricating greases and oils will commence, shortly after the first of the year.

* * *

THE Cleveland Tractor Co., Cleveland, has entered into a contract with the government of the province of Quebec for an unlimited number of tractors. Quebec is to finance the sale of the tractors to farmers in promoting greater farm efforts.

The company has reached a production of 8000 tractors of the crawler type since it began operation four years ago. The output this year was double that of the previous year, when production was rushed to help in wartime farming. The present factory space is being doubled.

* * *

THE Billings & Spencer Co., Hartford, Conn., is to increase its capital stock from $750,000 to $1,000,000, the $250,000 to be used for an expansion of the plant. The directors of the company, at a meeting Dec. 2, elected two new officers, J. B. Sehl being promoted from assistant treasurer to second vice president, and A. W. Gray being elected to succeed Mr. Sehl as assistant treasurer. Mr. Sehl has been with the company seven years, the last three as assistant treasurer. He also is factory manager. Before going to Hartford he was manager and treasurer of the Precision Die Casting Co., Syracuse, N. Y.

Here and There in Industry

Live Information Which Records the Expansion of Various Lines of Productive Enterprise

BUSINESS and property of the O. S. Walker Co., Worcester, Mass., manufacturer of grinding machines and magnetic chucks, has been sold by Oakley S. Walker to a group of men prominently connected with the machine tool and supply business. The reorganization has been completed and the new management has assumed control. The name of the company will remain unchanged. The sale includes the company's plant on Rockdale street, Greendale, Mass. The officers of the company now are: President, W. B. McSkimmon, Boston; vice president, J. H. Drury, Athol, Mass.; general manager, secretary and treasurer, Clayton O. Smith, who until recently was sales manager of the Norton Grinding Co. The third director being William F. McCarthy, Boston. Isaac F. Williams remains as manager.

The new ownership brings increased financial resources for the Walker company, which means the development and increase of the business.

* * *

RECENTLY formed at Detroit, the American Auto Parts Co. will build and operate a plant which will have an immediate capacity of 2500 tons of automobile springs per month. Most modern mechanical and heat treating equipment will be utilized and the furnaces, other heat treating equipment and power system were designed and constructed by the McCann-Harrison Co., Cleveland, engineer and contractor, and this company will supervise their installation. The building construction is being handled by the Thompson-Sterrett Co.

* * *

REORGANIZATION recently was completed by the Pittsburgh Rivet Co., Pittsburgh, by the election of the following officers: William J. Reitz, president; Jacob H. Reitz, vice president; John F. Lehrian, treasurer; and Roy A. Reitz, secretary. The company has leased a tract, 100 x 100 feet, adjoining its plant at Thirty-eighth street and the Baltimore & Ohio railroad and will erect an addition. It expects to be in the market shortly for equipment for the extension and plans to increase the number of its products by the addition of some specialties.

* * *

W. E. MOORE & CO., engineers, Pittsburgh, now are busy designing a new carbide plant for the Farmers Standard Carbide Co., Freydenburgh Falls, N. Y. A 46-foot waterfall will be developed to a capacity of 3700 horsepower. A 3-phase carbide furnace, made by the Pittsburgh Electric Furnace Corp., Union bank building, Pittsburgh, will be installed, together with crushing, screening, canmaking and packing machinery, to handle an output of 30 tons per day. W. B. Ragatz, of the Union Carbide Co., has been engaged as works manager.

* * *

THE Lumen Bearing Co., recently organized at Youngstown, O., for the erection of a plant to manufacture bearings of an improved type, has elected the following officers: William H. Barr, president and treasurer; C. H. Bierbaum, vice president; N. K. B. Patch, secretary. The officers and the following comprise the board of directors: Thomas Parrock, H. B. Parrock, Kester Barr, L. B. McKelvey, J. F. Bonnell and B. G. Parker. The company is erecting a plant, the first unit of which will be 105 x 140 feet, and expects to produce its first castings April 1, next.

* * *

CAPITALIZED at $100,000, the Pacific Iron & Steel Co., Inc., 610 Laughlin building, Los Angeles, will equip a foundry and machine shop in addition to its present steel plant. Construction will start soon on these two buildings and the company will be in the market for foundry and machine shop equipment at an early date. Included in the latter is one large boring mill, several large lathes, a few small punches, etc. Officers are: President, D. M. Ward; vice president, A. J. Anderson; secretary and treasurer, C. E. Bradburn. The plant is located at 2637 to 2665 Humboldt street.

* * *

THE Judson Mfg. Co., San Francisco, with works at Emery, Cal., about Jan. 1 will have ready for operation a new 19-inch breakdown mill and a 16-inch 5-strand bar mill, driven by an 800-horsepower motor. The mill will take from a 6 to an 8½-inch ingot. A new continuous furnace for No. 1 10-inch mill will be 125 feet long. The No. 5 mill, 5-stand, will have a hot bed 150 feet long. A 50-ton open-hearth furnace now under way will be completed shortly after Jan. 1, it is thought. The Judson company also will have a new rolling mill shortly.

* * *

THE Eastern Foundry Co., which operates a gray iron plant at Jamesburg, N. J., for casting piano plates and backs as well as other castings for musical instruments, has been incorporated with an authorized capital of $350,000. The incorporators include Thomas J. Watts, Mattawan, N. J., and William B. White, South River, N. J. The office is at 152 Main street, South River, N. J., where the company is about to erect a branch plant. It will contain about 40,000 square feet of floor space and will be devoted to piano plate and other specialties that now are produced at the company's plant at Jamesburg.

* * *

ORDERS booked during October by the Chicago Pneumatic Tool Co., Fisher building, Chicago, are stated to be in excess of any previous month since the signing of the armistice. This is true as well of the English and German subsidiaries. While the German subsidiary of the Chicago Pneumatic Tool Co., Chicago, was seized by the German government and operated by it under "compulsory administration" since the entry of the United States into the war, this now has ended and the management transferred back to the Tool company through the courts of commerce. This information was conveyed by cable recently from the company's representative now returning from Berlin. He states that the German company was well managed during the war and while it now is operating on a satisfactory basis, arrangements have been made to increase its production materially.

Plans Refinancing

Inland Steel Co. Outlines Extensive Stock Changes—Growth is Marvelous

Chicago, Dec. 9.—Preliminary steps have been taken by the Inland Steel Co. for complete refinancing and reincorporation. The recommendations of the board of directors will be presented at a special meeting of stockholders Dec. 16, when they undoubtedly will be adopted.

The Inland company now is incorporated under a Delaware charter for $30,000,000, of which $25,019,500 is outstanding. The shares have a par value of $100. New stock of $25 par value is to be issued and exchanged for old stock on the basis of four to one. The company then will be incorporated under the new Illinois law, with stock of no par value, which will be exchanged share for share for the $25 Delaware stock. The new stock will be tax exempt in Illinois. Dividends at the rate of 8 per cent a year have been paid since Sept. 1, 1915. The dividend rate on the new stock is expected to be $4 per year, which would be equivalent to 16 per cent on the present stock. The New York stock exchange will be asked to list the new issue. Present stock is now in the unlisted department of the Chicago exchange but is inactive as it is closely held and commands a high price. The Illinois corporation will have a capitalization of 1,200,000 shares, of which 1,000,780 will be exchanged for the old stock, leaving 249,220 shares to be disposed of as the board of directors decide.

The measures outlined probably will not mark the completion of Inland's new financing. Further developments will await the forthcoming decision of the Supreme court on the taxability of stock dividends as income. At the end of the last fiscal year the company had a surplus of $14,301,973, held cash and Liberty bonds in excess of $10,000,000 and reported receivables nearly $5,000,000 in excess of payables. In addition the current year's earnings have been good.

From a junk pile to one of the largest integrated units in the steel industry of the country with total resources close to $100,000,000, is the history of the wonderful growth of the Inland Steel Co. The company's spectacular rise has been due to the work and management of its builders —the Block Brothers, P. D. and L. E., and George H. Jones, who founded the company, and Alexis W. Thompson, R. J. Beatty and E. M. Adams, who joined the staff of executive officers about 17 years ago.

Starting in 1893 as a small rerolling plant at Chicago Heights, handling mostly scrap iron, the company struggled along, making headway slowly until the three prosperous steel years immediately preceding 1911. Then the capital stock had risen to $6,000,000 and the company was in such a financial position that it began to branch out. In the next two years the stock was increased to $10,000,000. Then the war greatly stimulated the company's expansion. In 1917 by a stock dividend the capitalization was raised to $30,000,000.

The company controls all materials and stages in the making of steel—iron deposits, lake vessels, coal mines, coke ovens and finishing plants at Indiana Harbor and Chicago Heights, with a capacity of more than 1,000,000 tons a year. During the period of the war a large amount of earnings was turned back into plant extensions. Still further expansion is under way. The company recently bought some 500 acres of land between its Indiana Harbor plant and Gary on which are to be erected more mills and furnaces.

Various Plants Started at Marysville, Mich.

Detroit, Dec. 9.—The Wills Automobile Co., headed by C. Harold Wills and John R. Lee, former executives of the Ford Motor Co., this city, has started building operations on its 4200-acre town site at Marysville, Mich., 52 miles north of here. The first units of the Wills motor car factory, in which an 8-cylinder automobile will be produced by next June, now are ready for structural steel. These units include the main assembly plant and a heat-treating building.

Nearby the steel work on the United States branch of the Pressed Metals Co., Ltd., of Canada, is going up while the Detroit Edison Co. is clearing ground for a $1,500,000 power and light plant.

About a dozen other industrial organizations have purchased sites in Marysville, plans for which provide for a model industrial city of wide streets, boulevards, parks and many other recreational facilities calculated to attract workmen desirous of more ideal living conditions than can be found in large industrial communities at present. Plans provide for an ore unloading dock on the St. Clair river, on which the town site is laid out, which will permit the biggest ore carriers on the lakes to discharge cargoes.

Storage Space

Of Refractory Manufacturers Filled and Some Curtailment is Forced

Pittsburgh, Dec. 9.—While shipments of refractories to the steel plants and blast furnaces have improved with the steady breaking up of the strike of the iron and steel workmen, considerable room for improvement still exists. Common labor is none too plentiful at the iron and steel plants and because of this condition shipments are going forward in no greater volume than they can be promptly handled.

A lack of specifications has resulted in considerable curtailment of brick plant activities lately, for manufacturers in a number of sections of the country continued making and piling during the first few weeks of the strike and now have no further storage capacity. Shortage of coal also is affecting production especially in the Middle West and at plants which do not own coal mines. The prices which have been in effect for several months still hold and seemingly no effort is being made to advance them.

Refractories

(Per 1000 f. o. b. works)

FIRE CLAY BRICK
(First Quality)

Pennsylvania	$36.00 to 41.00
Ohio	36.00 to 38.00
Kentucky	36.00 to 41.00
Illinois-Missouri	30.00 to 40.00

FIRE CLAY BRICK
(Second Quality)

Pennsylvania	$30.00 to 35.00
Ohio	20.00 to 25.00
Illinois-Missouri	25.00 to 30.00

SILICA BRICK

Pennsylvania	$40.50 to 45.00
Chicago	45.50 to 50.50
Birmingham	46.50 to 51.50

MAGNESITE BRICK
(Per Net Ton)

9 x 4½ x 2½	$80.00 to 85.00

CHROME BRICK
(Per Net Ton)

9 x 4½ x 2½	$80.00 to 90.00

BAUXITE BRICK
(Per Net Ton)

55 per cent	$ 40.00 base
76 per cent	100.00 base

To Cast by Machine

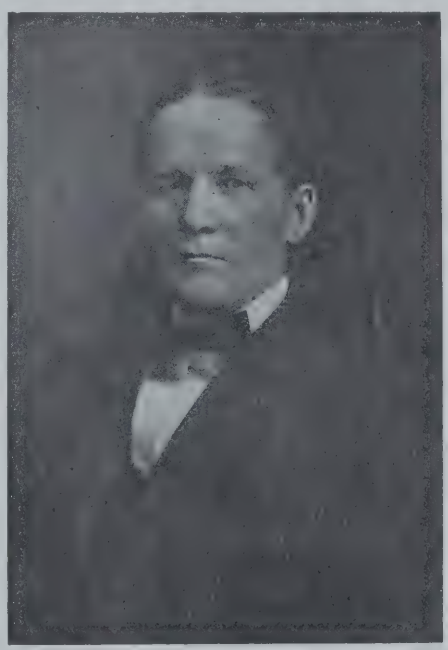
A pig-casting machine will be installed at the Atlantic furnace of the Republic Iron & Steel Co., New Castle, Pa. The molten metal at present is cast in sand pig beds. With the completion of the pig machine, the company will be in a position to operate the Atlantic stack on merchant iron when the output is not required for other purposes.

Men of the Iron Trade

Personal News of a Business Character Regarding the Men of Affairs of the Industry

WILLIAM A. THOMAS has resigned as president of the Brier Hill Steel Co., Youngstown, O., of which he has been the executive head since the organization of the company in 1912. Mr. Thomas' resignation is to become effective Jan. 27 when the annual meeting of the board of directors is to be held. It is understood Mr. Thomas informed the board of directors at its meeting last January of his desire to retire at the end of the current year, and be relieved of executive responsibilities. Mr. Thomas' identification with the iron and steel industry dates back over a period of 20 years or more. Prior to that time he was engaged in the dry goods business for a period of about 15 years. When the American Sheet Steel Co. was organized Mr. Thomas entered the sheet business, organizing the Niles Iron & Steel Co., Niles, O. After carrying on operations under this title for about four years he and his brothers purchased the holdings of the other partners and reorganized the company with increased capital. The reorganized company was given the name of the Thomas Steel Co., and carried on expanded operations until it, with other interests, was joined with the Brier Hill Steel Co. Mr. Thomas' administration as president of the Brier Hill Steel Co. has been marked by the rapid expansion of the company's works.

Martin Stuit has been made treasurer of the Standard Malleable Iron Works, Muskego, Mich.



W. H. Lutz, for 35 years connected with the Reading Iron Co. and superintendent of its Ninth street rolling mills for many years, has resigned, effective Jan. 1, because of ill health.

Arthur H. Jones has been made Seattle sales agent for the Consolidated Steel Corp., 165 Broadway, New York City, with headquarters at 1419-20 L. C. Smith building, Seattle, recently established.

James Gilchrist has been placed in charge of the branch office established at 136 Liberty street, New York City, by Nielson & Maxwell, Ltd., Glasgow, Scotland, iron and steel merchants.

Raymond Fisher, for several years chief civil engineer of the plant of the Pittsburgh Crucible Steel Co., Midland, Pa., recently resigned to accept a position with the H. W. Johns-Mansville Co.

J. H. Creighton recently was elected secretary-treasurer of the Monongahela Iron & Steel Co., Pittsburgh, succeeding George B. Meanor Jr., who retired from the company to go into the laboratory supply business at Birmingham, Ala.

WILLIAM A. THOMAS

Joseph G. Butler Jr., vice president of the Brier Hill Steel Co., Youngstown, O., and director of the Youngstown Sheet & Tube Co., suffered a severe scalp wound and a fractured rib when he was run down by an automobile near his home, Dec. 5. Despite his 79 years he is making rapid recovery.

C. T. L. Edwards resigned as superintendent of blast furnaces of the Bethlehem, Pa., plant of the Bethlehem Steel Co., Dec. 1. Mr. Edwards entered the employ of the Bethlehem company in 1912, becoming superintendent of blast furnaces in June, 1918. He has been succeeded by G. H. Hohl, formerly assistant superintendent of blast furnaces.

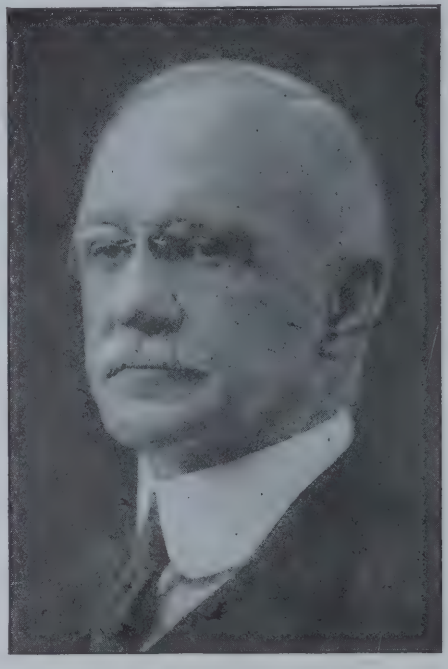
Fred P. McLyar, who for the past eight years has been foreman of the hot-mill department at the Guernsey works, American Sheet & Tin Plate Co., Cambridge, O., has resigned to become superintendent of the Newton Steel Co., Newton Falls, O.

J. Ramsey Speer has resigned as president to become chairman of the board of the Pittsburgh Iron & Steel Foundries Co., Pittsburgh, and Charles McKnight, treasurer of the company, has been elected to succeed him as president. Mr. Speer served the company as vice president from 1899 to 1911, and as president from 1911 until Nov. 1 of this year. Mr. McKnight has been treasurer and a director of the company since 1899.

William M. Corse has resigned as technical superintendent of the Ohio Brass Co., Mansfield, O., to become general manager of the Monel Metal Products Corp., Bayonne, N. J. The Monel company, which specializes in monel metal and aluminum bronze castings formerly was the Bayonne Casting Co. Prior to his connection with the Ohio Brass Co., Mr. Corse was associated with the Titanium Bronze Co., Niagara Falls, N. Y., and the Detroit Lubricator Co., Detroit. In 1908 he was elected secretary-treasurer of the American Institute of Metals, now the Institute of Metals division of the American Institute of Mining Engineers, and became president of that society in 1917.

John H. Dwight, for seven years vice president and general manager of the Belle City Malleable Iron Co. and the Racine Steel Casting Co., Racine, Wis., has tendered his resignation, to take effect Jan. 1, and will join the Saginaw Products Co., Saginaw, Mich., as vice president in charge of production. The Saginaw company is a division of the General Motors Corp. Mr. Dwight went to Racine from Chicago in 1904 and with the exception of five years was associated with malleable and steel companies. For a time he was secretary of the Racine Rubber Co. and afterward manager of the wagon department of the Mitchell Motors Co., rejoining the Belle City company in 1912.

New Officers of Engineers



Elected at Fortieth Annual Meeting, Held at New York City, Dec. 2 to 5

FRED J. MILLER, who was elected president of the American Society of Mechanical Engineers, at its fortieth annual meeting at New York last week, succeeds M. E. Cooley, dean of schools of engineering, University of Michigan, Ann Arbor, Mich. Mr. Miller was born in Ohio in 1857. After a high school education, supplemented by personal study and special instruction, he served a 4-year apprenticeship in the machinist trade and for a number of years was employed in various capacities in machine shops.

He contributed largely to mechanical journals and finally became a member of the editorial staff of the *American Machinist,* where he remained for 20 years. The last 10 years of that period, he was chief editor and also vice president of the publishing company. After retiring from the journalistic field, Mr. Miller became general manager of a group of typewriter factories, in which capacity he served for nine years. He then was commissioned a major in the ordnance department of the United States army, being stationed during most of his service at the Rock Island arsenal. While there he organized and was at the head of the civilian service division of the arsenal. He later became attached to the office of the director of arsenals at Washington, being assigned to duty at the plant of the Bethlehem Steel Co. He then was attached to the office of the secretary of war. At present he is a member of the technical advisory committee of the war claims board at Washington.

Mr. Miller became a member of the American Society of Mechanical Engineers in 1890 and has always taken an interest in its affairs. He has served on various important committees and was a member of its council from 1904 to 1907, inclusive. He also served two terms as the society's representative on the board of the United Engineering societies, where he was chairman of three successive committees entrusted with the work of reorganizing and perfecting the Founder societies' business affairs and finances.

John Robins Allen, Robert H. Fernald and Edward C. Jones were elected vice presidents at this meeting. Mr. Allen was born in Milwaukee in 1869 and was graduated from the University of Michigan in 1892. For one year he was affiliated with the Industrial Works, Bay City, Mich., and for two years with the L. K. Comstock Construction Co.

FRED J. MILLER

He then served various educational institutions in important capacities.

Robert H. Fernald, who likewise was elected vice president, has held various professorships in educational institutions. He was instructor and assistant professor from 1893 to 1901 at Case School of Applied Science, Cleveland. From 1907 to 1912, he was professor of mechanical engineering, holding that same position from 1902 to 1907 at Washington university, St. Louis. Since 1912 he has been professor of dynamical engineering at the University of Pennsylvania, Philadelphia. Since 1910, Professor Fernald has served as consulting engineer of the fuel division of the bureau of mines, Pittsburgh.

Edward C. Jones, a third vice president, has had a prominent affiliation with the gas and electric power industry. He is now chief engineer of the Pacific Gas & Electric Co., of which he now is chief engineer.

Elbert C. Fisher who was made manager, was born in Scranton, Pa., in 1865. He was graduated from Cornell university in 1890. For one year, he was employed in the locomotive repair shop of the Delaware, Lackawanna & Western railroad, Scranton; a like period for Westinghouse-Church-Kerr & Co., Chicago, and then was manager of the Chicago office of the Murphy Iron Works. In 1895 he became associated with Wickes Bros., Detroit, and was made vice president and general manager of the Wickes Boiler Co., in 1908, a position which he now holds.

Dexter S. Kimball, also elected manager, served his apprenticeship in the shops of Pope & Talbor, Port Gamble, Wash., and the Union Iron Works, San Francisco. In 1898 he became designing engineer for the Anaconda Mining Co., and for three years served as assistant professor of machine design at Sibley college, Cornell university. He then became works manager of the Stanley Electric Mfg. Co., Pittsfield, Mass. In 1904, he returned to Cornell as professor of machine design and construction and since 1915, has occupied the chair of industrial engineering.

Earl F. Scott, a third manager elected, after serving as instructor in mechanical engineering at Vanderbilt university, was occupied with drafting and mechanical designing for several years. From 1905 to 1908, he was affiliated with A. M. Lockett & Co., New Orleans, La., contracting mechanical engineers. During that time, Mr. Scott had charge of the engineering department, designing and supervising the construction of a number of large irrigation, power and steam-heating plants. Five years subsequent to 1908, Mr. Scott had charge of the Atlanta, Ga., plant's engineering department, of the General Fire Extinguisher Co. For one year he served as assistant manager of the Atlanta office of the Griscom-Russell Co. Since 1914, Mr. Scott has been president and manager of Earl F. Scott & Co., Inc., and has designed and supervised the installation of equipment in cotton mills of the south.

Men of the Machinery Trade

Personal News of a Business Character Regarding the Men of Affairs of the Industry

OAKLEY S. WALKER, who as noted in THE IRON TRADE REVIEW of Dec. 4, retired recently from the O. S. Walker Co., Worcester, Mass., founded by him and of which he was president and treasurer for a long period, has been succeeded in the former position by W. B. McSkimmon, Boston. J. H. Drury, Athol, Mass., is vice president of the reorganized company; Clayton O. Smith is general manager, secretary and treasurer. William F. McCarthy, Boston, also is on the board of directors.

Mr. Walker occupies a prominent place in American machine tool circles as a designer and manufacturer of grinding machines. In this work he was a successful pioneer and was the inventor and developer of the magnetic chuck. He was a machinist by trade and early revealed a genius for machine design. Before located in Worcester in 1886, he had manufactured drill grinding machines in a small way in Watertown, N. Y., his native city. His first three years in Worcester, were spent in the Washburn shops, where he designed and perfected a twist drill grinding machine which since has had a wide sale. From 1890 to 1897 he was employed as grinding machine designer for the Norton Co., then the Norton Emery Wheel Co., and developed various machines which have played a considerable part in the development of the business of the Norton Grinding Co.

While at work on a magnetic chuck brake, Mr. Walker observed the power magnetized metal asserts to hold to it other metal and from this evolved the magnetic chuck. When Mr. Walker established his first shop on Union street, out of which grew the O. S. Walker Co., the major portion of his time was devoted to the production of this type of chuck. Later he commenced the manufacture of grinding machines as a separate business until the shops were combined and removed to the Samuel Porter building on Union street. In 1900 the present shops were erected and the business since has been carried on in Greendale.

Clayton O. Smith, the new manager of the O. S. Walker Co., was graduated in 1892 and 1893 as mechanical and electrical engineer respectively from Worcester Polytechnic institute. He then took a student course at the Westinghouse Electric & Mfg. Co., East Pittsburgh, Pa., and from there went with the C. W. Hunt Co., Staten Island, N. Y. Later for five years, he was employed by the Norcross Bros. Co., Worcester, in the drafting and engineering department and became affiliated with the Norton Grinding Co., in its early days, being placed in charge of the drafting department. In 1902 he was promoted to be superintendent, in 1905 took charge of the office and in 1907 became sales manager.

Isaac F. Williams, who remains with the new company, has been manager of the business for the last four years. He was graduated from Worcester Polytechnic institute in 1897 and for a time was assistant superintendent of the Washburn shops of the institute. He entered the employ of Mr. Walker when the latter started in business for himself. His responsibilities gradually were increased until he became manager of the business.

J. E. Houck has been appointed traffic manager for the Samson Tractor Co. division of the General Motors Corp., at Janesville, Wis.

Julius Milkey has taken charge of the advertising department of Landers, Frary & Clark, New Britain, Conn.

Charles M. McNeil, president of the Utah and Chino Copper companies, has been elected a director of the American Vanadium Co.

J. H. Fellows has been placed in charge of the construction and plant engineering departments of the Stanley Works, New Britain, Conn.

E. J. Wilkie formerly connected with the sales department of the Bucyrus Co., South Milwaukee, Wis., has taken up his duties as assistant to C. N. Ballentine, southern sales manager for the company at 212 Jefferson County bank building, Birmingham, Ala.

Abram Buol, superintendent of the New Britain Machine Co., New Britain, Conn., has been elected president for two years of the New Britain chamber of commerce.

C. M. Wallace has been engaged as purchasing agent for the Standard Motor Truck Co. He was formerly connected with the Packard Motor Car Co., Detroit.

Waldo S. Reed, formerly treasurer of the Emergency Fleet corporation, has been elected treasurer of the Green Star Steamship Corp., New York.

W. H. Blake recently resigned as electrical engineer of the Charleroi, Pa., plant of the Universal Steel Co., Bridgeville, Pa., and will go into business for himself.

Milton S. Monteith, master mechanic and chief engineer of the Warren Mfg. Co., Warren, R. I., has resigned to become chief engineer for D. Goff & Sons, Pawtucket, R. I.

George E. Leighton, 136 St. James street, Montreal, consulting mining engineer, recently was elected vice president of the Samuel Osborne Co. of Canada, 145 St. James street, that city, manufacturer of steel, tools, etc.

John J. Eberhard, for the past 10 years connected with the Simonds Mfg. Co., Fitchburg, Mass., first as superintendent and more recently in charge of the hand-saw department, has resigned.

L. B. Marcy, for the past three years superintendent of the Hart & Cooley Mfg. Co., New Britain, Conn., has resigned to accept a position with the Waterbury Mfg. Co., Waterbury, Conn.

William L. Robbins, for the past five years advertising manager of the Greenfield Tap & Die Corp., Greenfield, Mass., has become sales promotion department manager of the Cowan Truck Co., Holyoke, Mass.

Ormond E. Hunt has resigned as chief engineer of the passenger car division of the Packard Motor Car Co., Detroit, to become president of the Mercer Motors Co., Trenton, N. J. He has been with the Packard organization since 1909.

Newark Makes a Bid For Foundry Convention

A meeting of the Newark Foundrymen's association, Newark, N. J., which was held Dec. 3, was participated in by the membership of the Gray Iron club and the Metropolitan Brass association, of New York. The object of the meeting was to bring the foundrymen of the Newark and New York districts closer together.

This was the first gathering of the kind ever held jointly by the three societies, and owing to its success the meeting probably will be repeated. A. E. Barlow, president of the Newark Foundrymen's association, presided, introducing Andrew N. Petersen, president of the Gray Iron club, and Frederick H. Landolt, president of the Metropolitan Brass association, who made brief addresses. It was proposed by Mr. Petersen that the 1921 convention of the American Foundrymen's association with its exhibition of foundry equipment and supplies, be scheduled for Newark or some other community in the New York district. This proposal, offered as a resolution, was adopted unanimously.

A. O. Backert, editor of *The Foundry,* was the speaker of the evening, and addressed the foundrymen on the foundry industry in France and England as seen through American eyes. Mr. Backert pointed out that whereas steelmaking capacity in this country has expanded at the rate of 10,000,000 tons a year, the pig iron production has remained almost stationary. He stated that this great demand for steelmaking iron has caused the increased prices and will continue to cause further advance. The speaker contrasted foreign with American foundry practice and enumerated the conditions which must be considered in making a fair comparison. He stated that the casting industry in France is not as large at the conclusion of the war, as it was previous to the German invasion, for the foundries gained through the accession of Alsace-Lorraine have been outnumbered by those destroyed by the enemy. In England the industry has expanded until now the foundries of that country number over 3000 active foundries.

Hold Sales Convention

About 300 salesmen, engineers and representatives of Blaw-Knox Co., Pittsburgh, attended the sales convention of that company held at Pittsburgh, Dec. 3 to 6. Discussions pertaining to all of the company's products were held and tours were made by the salesmen and representatives through the company's plant. Some of the discussions were: "Handling an Order;" "Information on Cost Keeping;" "Discussion of Knox Devices;" "Discussion of Plate and Structural Sales," and other subjects. The committee in charge of the convention was composed of Chester H. Lehman, H. B. Loxterman, Jay E. Mason, J. H. Flynn and G. E. Land.

Will Form Labor Board

Leaders in Youngstown, O., affairs are behind a plan to establish an industrial relations board for the promotion of greater amity between capital and labor.

The announced purpose of the promoters of the plan is to study the problems and grievances of employer and employe and to arrange a basis on which both can work for the best interests of the community. These leaders are understood to have approached employers and labor leaders and learned that both were favorable to ironing out any differences in such a way as to insure not only industrial peace but the complete harmony which labor and capital say is necessary to proper production and sound prosperity. Four citizens, one a manufacturer and one a labor leader are said to have signified willingness to sit on the board.

Changes Labor Policy

Washington, Dec. 9.—The United States shipping board announces that, in order to co-ordinate its labor policy and bring about a more consistent method of dealing with labor problems, all questions of labor policy affecting the construction, repair, operation, loading and unloading of ships and marine equipment, will hereafter be handled, subject to the direction of the board, through the division of industrial relations of the shipping board at Washington. Darragh de Lancey, heretofore director of the marine and dock industrial relations division, has been appointed director of the division of industrial relations.

With the return to work of a number of molders and coremakers, the strike at the plant of the Bay View Foundry Co., Sandusky, O., apparently has ended. More men are expected to seek their old jobs and all for whom places can be found will be taken back. The strike had been in progress 12 weeks.

New York Fabricators Not to Drop Open Shop

While a wage scale agreement for 1920 recently was closed between the Building Trades council, New York City and the Building Trades Employers' association, structural steel fabricators and erectors will not be a party to this contract, which had the closed shop for its feature. Under the contract as signed, union men employed on building operations where nonunion men are working are permitted to strike. Walter Drew, counsel for the Iron League Erectors' association, whose members also are members of the Employers' association, announced that his organization did not intend to abandon the open shop.

Nov. 26, 1919.

To All Architects, Owners, and Prospective Builders in Greater New York and Long Island:

Gentlemen:—As a result of the criminal records of a large number of officers and men prominent in the International Association of Bridgemen and Housesmiths, involving intimidation, violence, destruction of property by dynamite, and other crimes, the erection of structural steel work in this city and vicinity was placed on the open-shop basis on Jan. 1, 1906, and has been maintained on that basis until the present time, resulting in greatly reducing the cost of building operations and the practical elimination of strikes in the steel branch of the industry.

The contrast beween the result obtained in that industry and that resulting in other trades where members of labor unions have been recognized exclusively has been most marked, and the investing public has been the recipient of the gain.

Pressure is now being brought to bear in certain quarters to induce the members of the Iron League Erectors' Association to change this policy and adopt the unamerican policy of the closed shop.

As such a change, if adopted would inevitably result in increasing the cost of buildings, in decreasing the efficiency of our workmen, in limiting the available labor supply in this district, in causing labor strikes and delays, and would violate the rights of many of our workmen under the constitution of the United States, the members of our association, at a meeting held in the rooms of the Building Trades Employers' association Nov. 25, 1919, unanimously voted to adhere to the policy which has proved satisfactory during the last fourteen years, to employers and workmen alike.

It is the intention of our members to offer employment to all applicants having the proper requirements, without regard to their affiliation or nonaffiliation with labor unions, thereby guaranteeing to each individual his constitutional right to such employment, based only on his own ability and efficiency.

We earnestly solicit your aid in retaining the results which have been gained as set forth above, by insertion in all contracts for the erection of structural steel work of a labor clause, copies of which are inclosed herewith. Very truly yours,

Bethlehem Fabricators, Inc., Bigelow & Nichols, Communipaw Steel Co., Donnell-Zane Co., Eidlitz & Ross, Martin R. Everett, Inc., William J. Fichter, C. H. Fox, Chr. Hafers Iron Works, Hamilton & Chambers Co., Harris Struc. Steel Co., Hay Foundry & Iron Wks., Hedden Iron Const Co., Hinkle Iron Co., Geo. A. Just Co., Lehigh Struc. Steel Co., Levering & Garrigues Co., Lucius Engineering Co., McClintic-Marshall Co., National Bridge Wks., Alfred E. Norton, Inc., Passaic Struc. Steel Co., Struc. Erecting Co., Members of the Iron League Erectors' Association.

Obituaries

LYMAN H. TREADWAY, president of the Peck, Stow & Wilcox Co., Cleveland, New York and Southington, Conn., and vice chairman of the Federal Reserve bank of the Fourth district, died Sunday morning, Dec. 7, at his residence in Cleveland. The cause of his death was heart disease and his condition was not believed to be critical until shortly before his death.

Mr. Treadway was 57 years old, having been born in New Haven, Conn., March 27, 1862. He was the son of Augustine R. Treadway, who died in Cleveland eight years ago. After his father had organized the Wilcox-Treadway Co., manufacturer of hardware and mechanics' tools, Mr. Treadway located in Cleveland in 1880. He had entered the mercantile business one year before in New Haven and when he came to Cleveland, he started as a packer in his father's plant, and learned the hardware and tool business from the ground up. The Wilcox-Treadway Co. later was incorporated into the Peck, Stow & Wilcox Co. The company's larger plant is located at Southington, Conn., where the company's centennial was celebrated on Aug. 29 and 30, of this year.

In 1911 Mr. Treadway succeeded his father as president of the company, upon the latter's resignation. While the direction of the business was his main activity, he was identified with many other interests. He was a director of the Peerless Truck & Motor Corp., and a trustee of the Western Reserve university, and was associated with various charitable, religious and civic organizations in Cleveland.

Henry Laurence Cantt, a leading industrial engineer, died suddenly at his home in Montclair, N. J., recently from an acute attack of indigestion.

Wm. E. Rice, former president of the Washburn & Moen Mfg. Co., and later connected with the American Steel & Wire Co., died in Worcester, Mass., Dec. 2, aged 86.

Jerome F. Good, aged 77, at one time superintendent of the plant of the Pittsburgh Forge & Iron Co., Pittsburgh, but latterly engaged in the real estate business, died at Pittsburgh, Dec. 1.

John A. Svenson, one of the founders and owners of the Worcester Ornamental Iron Works, Worcester, Mass., with which he has been connected the past 15 years, died at his home in that city, Dec. 4, from pneumonia, aged 54 years.

William G. Holmes, president of the Holmes Bronze Co., Bedford, O., founded by him, died on Nov. 30 in Silver City, N. M., where he had gone for his health. Mr. Holmes was

LYMAN H. TREADWAY

graduated from Ohio State university in 1904 and was a member of the Phi Kappa Psi fraternity.

Edward C. Wood, Somerville, Mass., experimental engineer, famed for work during the war, on devices for detection of submarines, died Dec. 1 of an accident at his work, aged 45 years. Most of the apparatus used during the war in submarine signaling was the result of the experimental work of Mr. Wood, and it has since been adopted as of practical commercial value in nearly every country on the globe.

William O. Oschmann, 35, electrical engineer of the Oliver Iron & Steel Co., Pittsburgh, died at the South Side hospital, Pittsburgh, Dec. 3 as a result of an accident. He was a native of Pittsburgh and resided there practically all of his life and had been connected with the Oliver Iron & Steel Co. for the past 12 years. He was a member of the American Institute of Electrical Engineers and the Association of Iron and Steel Electrical Engineers.

John F. Harrison, for many years manager of the flour and saw mills department of the Allis-Chalmers Mfg. Co., Milwaukee, died after a brief illness Dec. 4, at the age of 78 years. Mr. Harrison was especially well known as a designer and builder of flour mills, although he handled some of the largest saw mill projects in the United States. He was born in 1841 at Manchester, Eng. At the outbreak of the Civil war, he enlisted in the engineer service of the union army. At the conclusion of the war, Mr. Harrison settled in Minneapolis, where he erected some of the biggest flour mills of the present day. He came to Milwaukee in 1884 as an engineer for the Allis-Chalmers Mfg. Co., then the E. P. Allis Co., and in 1894 was promoted to the position of manager of the saw and flour mill departments.

William Ellis Rice, formerly president and treasurer of the Washburn & Moen Mfg. Co., and president and treasurer of the Worcester Wire Co., of which he was the founder, died at his home in Worcester, Mass., Dec. 2, aged 86 years. Mr. Rice retired from active business life when the American Steel & Wire Co. took over the two corporations in 1899. He was at one time one of the best known wire manufacturers in the United States. He began work in a wire mill at the age of 18 and seven years later started in business for himself with Dorrance S. Goddard, father of Harry W. Goddard, chairman of the board of directors of the Clinton-Wright Wire Co., Worcester, under the firm name of William E. Rice & Co., the plant being in Holyoke, Mass. Later it became part of the Washburn & Moen Mfg. Co. In 1870 he visited England and Sweden and was the first consumer in this country to import rolled iron direct from Swedish makers. In 1877 he organized the Worcester Wire Co., which he successfully carried on until it was merged with the American Steel & Wire Co. The Washburn & Moen Mfg. Co. and the Worcester Wire Co. now are the North, South and Central works of the American Steel & Wire Co. in the Worcester district.

U. S. Not to Aid Foreign Credits

Secretary Glass in Annual Report Sets Forth Government Policy—Demoralization of Exchanges Reflects Weak Credit Position of European Nations as Well as Adverse Trade Balance—General Financial News

BY JOHN W. HILL, FINANCIAL EDITOR

IN HIS annual report published a few days ago Secretary of the Treasury Glass dashed cold water upon the hopes of those who believe the government should participate on a large scale in further peacetime loans to the hard-pressed European nations. Instead of high commodity prices based upon the "spectre of European demand or high interest rates based upon the spectre of European credits," Mr. Glass warned that this country's fear must be that the cessation of war exports will result in closed plants, passed dividends and general depression.

Adverse Trade Balances Responsible

In a word Mr. Glass, speaking for the administration, puts it straight up to the American exporter to go out into the markets of the world and find his customers and arrange his credit terms with them, without the aid of the government. Answering the urgings of those that this government continue the flow of credits abroad to the point of stabilizing foreign exchanges, Mr. Glass makes some interesting observations the soundness of which cannot be disputed. He says:

"The artificial maintenance of the gold par of all exchanges is impossible unless we propose to level all differences in the relative credit of the nations and for our gold reserve substitute a reserve consisting of promises to pay of any nation that chooses to become our debtor. The United States has met a greater proportion of the cost of the war from taxes than any other country. Largely as a result of this the buying power of the dollar at home has been sustained better than the currency of any European belligerent. For the United States government to depress the dollar as measured in terms of foreign exchange and to improve the position of other currency as measured in terms of dollars would be to shift to the American people the tax and loan burden of foreign countries. This shifted burden would be measured in taxes, additional loans and increased domestic prices."

The secretary's views are based upon the recognition of the fact, pointed out previously by THE IRON TRADE REVIEW, but too frequently overlooked in discussions of the foreign exchange question, that adverse trade balances are not entirely responsible for the depressed exchanges. This is but one of the factors in the situation, by far the most important one being the weak credit position reflected in the astounding depreciation of the currencies of various countries. Sufficient credits to pay for all of the European purchases in this country, or enough exports to pay for all that was imported from the United States, would not bring the exchanges to par so long as the war debt had not been liquidated to some extent, and substantial deflation of the huge amounts of circulation currency and credits had not taken place. Consequently the task of bringing the exchanges to par is something that may not be accomplished with America's golden wand, unless this country is willing to lower its credit to the level of the weaker nations, an unthinkable solution.

Although the government will not make any such effort the fact remains that the treasury still has available $593,628,000 of the total of $10,000,000,000 loans authorized together with $1,000,000,000 in addition which the War Finance Corp. has been authorized to extend to aid exports. As Mr. Glass points out the power of the government to aid Europe financially is considerable. Respecting it he says that "this power must be exercised with extreme caution and with the utmost regard for the urgent needs of our own people for an ample supply of foodstuffs and other necessities at reasonable prices."

On the face of the monthly export records it would seem that American exporters have little to worry about in the exchange situation. October exports gained $35,000,000 over those for September and almost $130,000,000 over those for October, 1918. Of this gain over one year ago $90,000,000 represents increased exports to Europe where the exchange rates are carrying the heaviest burden of depreciation. From these figures many are likely to hasten to the conclusion that Europe's necessities are so urgent that she must come to America for goods at whatever price or exchange premium.

Trade Follows the Dollar

This is true to a certain extent, but eventually Europe, or that part of it with depreciated exchanges, will find a way to stop buying even necessities, unless improvement comes. Analysis of exports to Europe shows that this tendency is already in operation. The real increases in exports have been to Spain, Norway and Sweden, Denmark and Holland where the dollar is at a small premium. France is reducing her purchases at the rate of $14,000,000 a month and Italy at the rate of $11,000,000 from last year. Belgium, however, is increasing purchases and so is Great Britain, where cotton is an important factor in prosperity.

How long will present enormous exports last? No one can certainly tell but with pound sterling at a discount of 21 per cent, francs at 53 per cent and Italian lire at 60 per cent drastic curtailment of foreign buying on the part of the great European customers probably is not far distant. Long time credits and reduced prices that will in a measure absorb the shock of the exchange premium and the operation of the Edge export financing bill, expected soon to pass, are methods which may help to bring relief.

New Republic Stock May Cover Further Mills

Youngstown, O., Dec. 8.—With the issuing of 26,480 shares of common stock by the Republic Iron & Steel Co. for the purpose of providing funds for works expansion, it is thought that additional sheet mills will be built at the company's De Forest plant at Niles, O. Officials of the Republic company neither affirm nor deny that such expansion will be undertaken soon. The De Forest plant now inculdes 10 sheet mills. At the time the Republic company took over this plant, it is understood, the plans provided for the building of 30 additional mills for rolling sheets and black plate together with tin-coating equipment.

Owners of common stock on record Dec. 26 will be privileged to subscribe on the basis of one share of the new stock for each 10 shares of the old stock with provisions being made for fractional titles. The new common stock is held at $100 par and will place $2,648,000 at the company's disposal.

The present outstanding common stock of the Republic Iron & Steel Co. includes 271,910 shares of an authorized issue of 300,000 shares. The new issue, which must be paid

by Jan. 16, 1920, will increase the outstanding common stock to 298,390 shares having a par value of $29,839,000.

Crucible Picks Officers

Pittsburgh, Dec. 8.—Horace S. Wilkinson, chairman of the Crucible Steel Co. of America, was re-elected chairman and elected president of the company at a meeting of the directors in this city today. He succeeds O. H. Wharton, who declined to be a candidate for re-election as president. Dr. John A. Mathews, Syracuse, N. Y., was elected first vice president; George E. Shaw, Pittsburgh, second vice president and treasurer; John W. Dougherty, Pittsburgh, third vice president; R. H. Illingworth, Harrison, N. J., fourth vice president, and H. F. Kress, secretary.

The company under the DuPuy regime had five vice presidents, John A. Sutton, John W. Dougherty, G. W. Sargent, H. A. Brown and George A. Turville, the latter also being secretary and treasurer of the company. The number is reduced to four by today's election and John W. Dougherty is the only one of the former vice presidents who was re-elected. H. F. Kress, who succeeds George A. Turville as secretary of the company, formerly was assistant secretary and treasurer.

To Build Bar Mill

Capitalized at $500,000, the Cambridge Steel Co. has been formed and is reported planning to erect a bar mill on the site of the Interstate Iron & Steel Co.'s plant at Cambridge, O., which was damaged by fire three years ago. No other details have been made public as yet.

Scrap Firms Combine

Bishop, Friedman & Bergstrom, Inc., is the title of a consolidation just effected of the following interests: J. V. S. Bishop, Philadelphia; Ellis O. Friedman, Inc., Albany, N. Y.; V. E. Bergstrom & Co., New York; Coatesville Scrap Iron & Steel Co., Inc., Coatesville, Pa. Offices will be maintained in the Real Estate Trust building, Philadelphia; 30 Church street, New York; 82 State street, Albany, and at Coatesville.

Buys Metal Stock

Charles D. Barney & Co., Chicago, and associates have purchased voting trust certificates representing 34,644 shares of stock of the American Metal Co., Ltd., which were offered at public auction by the alien property custodian. The purchase price was $166 a share. The deal amounts to $5,310,000, and is one of the largest that has ever been negotiated by the alien property custodian. The same stock was offered at public auction on April 7, when the successful bidder was Charles Hayden of Hayden, Stone & Co. This transaction was, however, set aside. The Hayden bid was $140 a share.

Buys Pipe Foundry

John S. Tait of J. S. Tait & Co., Ltd., 500 Beatty street, Vancouver, B. C., has purchased the Vancouver Pipe & Foundry Co., Ltd., that city, and now is making cast iron soil pipe and fittings.

Sells Forging Plant

The Bethlehem Steel Co. has sold its forging plant at Titusville, Pa. Mr. Dillon, up to the time of the sale of the plant, was the general manager of the property. The plant was acquired by the Bethlehem Steel Co. from the Dillon interests about seven years ago.

Issue Oversubscribed

Youngstown, O., Dec. 8.—Official reports show that employes have oversubscribed the new issue of preferred stock of the Truscon Steel Co. The stock to the amount of $1,000,000 with a par value of $10 per share, was authorized by the directors Oct. 7.

Financial Crop Ends

The Semi-Foundry & Machine Co., of Barberton, O., has been taken over by the Frantz Foundry & Machine Co. of Akron, O., a $400,000 corporation.

* * *

The Cromwell Steel Co., Lorain, O., will redeem all of its first mortgage 7 per cent bonds at their face value plus 1 per cent premium and accrued interest at the First Trust & Savings Co., Cleveland, Jan. 1.

* * *

The Van Dorn Iron Works, Cleveland, has amended its charter placing common stock on a no par basis. New capital will consist of $2,000,000 7 per cent preferred of which $650,000 has been sold and 100,000 shares of common stock of which 80,000 will be issued.

* * *

William C. Redfield, former secretary of the department of commerce, has entered the investment security business in New York, associating himself with H. P. Wilson under the firm name of Redfield & Wilson. The firm expects to conduct reorganizations and consolidations of industrial and public utility companies.

Prices Advance

In Benzol and Toluol as Result of Curtailment by Strikes

New York, Dec. 8.—Benzol finally has advanced, the market on spot and contract business now holding at 27 to 31 cents, a rise of 2 cents in the week. Ninety per cent benzol is quoted at a 1-cent advance or 23 to 25 cents. A rise of 2 cents also is shown in toluol, the market now being 28 to 32 cents.

This advance has been expected for several weeks. Had it not been for the appearance of taking an undue advantage of the situation brought about by the steel strike, producers assert they would have advanced prices early in October, so heavy was the demand at that time. Since, the demand has continued strong, and this in conjunction with the curtailment of production brought about by the steel strike and later by the coal strike has made an exceedingly tight market. Only occasional lots of benzol are available for spot delivery, and contract shipments have been extended beyond the first half. So far have shipments been advanced that recent contract inquiry has fallen off.

Prices on sulphate of ammonia, which of late have featured the coal-tar products market, are unchanged this week. Spot domestic is quoted at $3.85 to $4, and for export $4.75 to $5 in double bags at eastern seaboard. future business is nominal.

Considerable activity is shown in naphthalin, the dye interests being good buyers. Quotations, however, are unchanged. Solvent naphtha is in steady demand at former prices.

Fair Trading in Machine Tools

New Departure Takes $1,000,000 Worth — Standard Ore Buys Heavily — Export Transactions are More Numerous—Van Dorn Iron Works Wants $100,000 Worth of Equipment—Coal Strike Effect as Yet is Normal

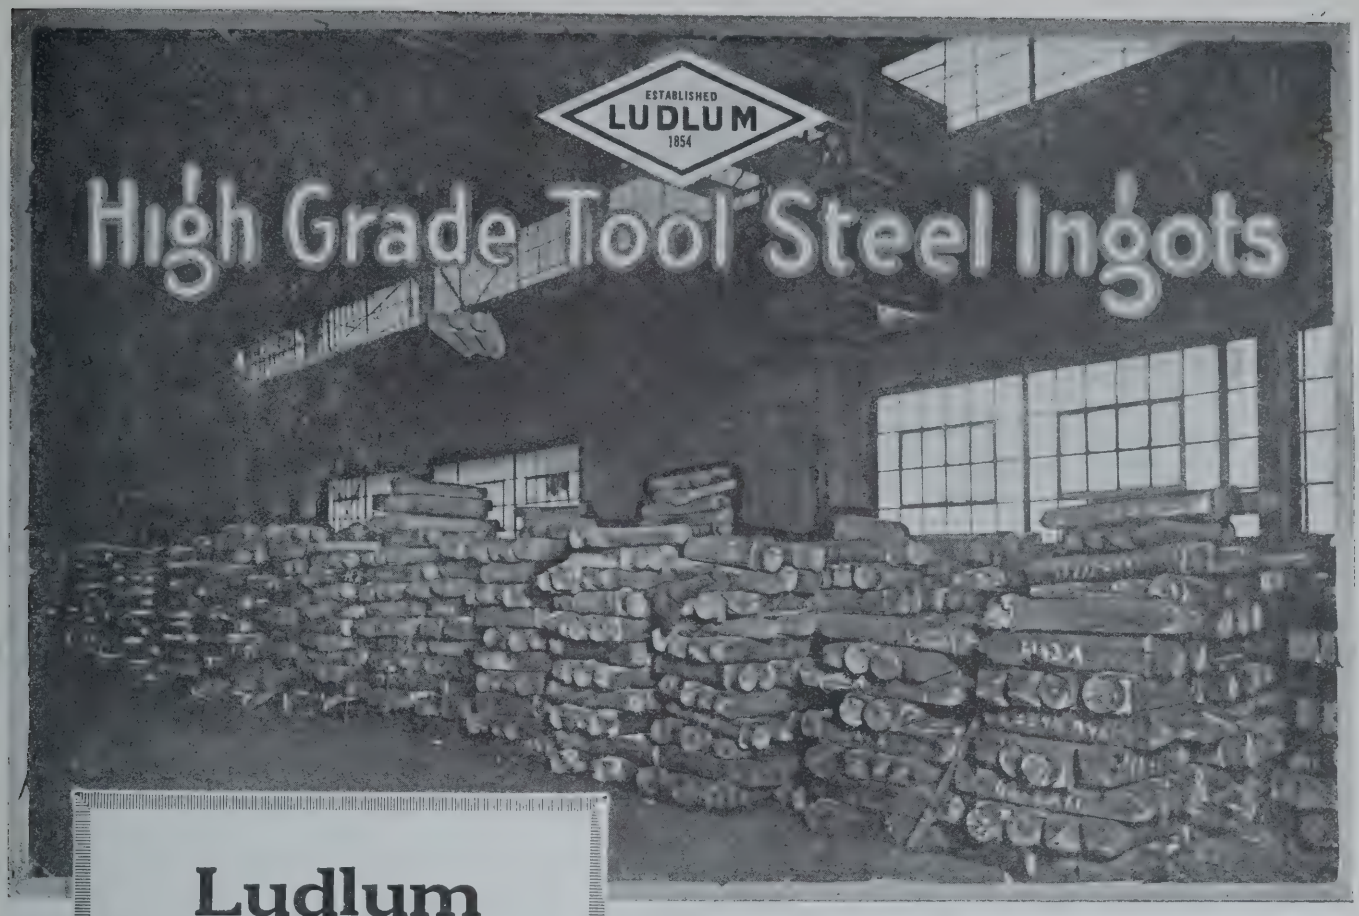
DEARTH of business, usually so apparent in the preholiday period, continues to hold off in the machine tool industry. In the East a considerable amount of trading is being done and inquiries are heavy in practically all districts. The New Departure Mfg. Co., Bristol, Conn., is reported to have closed on $1,000,000 worth of equipment and the Standard Oil Co. again is buying for Roumania, the award this time aggregating about $400,000 worth. It also is in the market for $90,000 worth of machine tool equipment for Mexico and Peru. It is buying considerable equipment for Toledo, O.

While export inquiries are not as numerous as two months ago, several sizable orders have been placed in addition to those of the Standard Oil Co. One Spanish shipbuilder has bought $30,000 worth of equipment. A Brazilian manufacturer closed on considerable and Brazilian railroads are inquiring, while Argentina railroads are buying. Chile is inquiring for additional locomotive cranes, although on machine tools severe competition in that country now is offered by German builders.

Eastern crane trading is somewhat restricted. The Sun Shipbuilding Co., Chester, Pa., closed on its overheads. The Eastern Potash Co., New York, the Tidewater Iron Works and the W. & A. Fletcher Co., Hoboken, N. J., each bought one. A list of overheads is expected from the Union Shipbuilding & Dry Dock Co., Baltimore while the Pennsylvania Service Corp., Philadelphia, is in the market for one. The Foote-Burt Machine Co., Cleveland, is about to close on 17 small electric cranes. In Pittsburgh, several small awards of cranes are reported. The Westinghouse Electric & Mfg. Co., inquires for 10 and the American Sheet & Tin Plate Co., asks for eight for Vandergrift, Pa.

In the Cleveland territory, dealers are active and have many inquiries. Sales are somewhat curtailed because of the approach of the inventory period, the coal strike and the fact that users' 1919 budgets for machine tool expenditure now are exhausted and they have to wait until 1920 before they can make additional purchases. Large inquiries are issued by the Van Dorn Iron Works Co., Cleveland, which wants $100,000 worth; the E. J. List Mfg. Co., Havana, Ill., the Zigler Mfg. Co., Alexandria, Ind., the Wm. H. Haskell Mfg. Co., Pawtucket, R. I. Formal lists are expected soon from the Wills Automobile Co., Marysville, Mich., the General Electric Co., Erie, Pa., the Tabor Mfg. Co., Philadelphia, and the Birdsboro Foundry & Machine Co., Birdsboro, Pa.

In Chicago, the coal strike is more of a factor than elsewhere apparently. Considerable hesitancy is manifested in ordering, but sellers state that business is not poor. The Nash Motors Corp., Milwaukee, has bought additional production equipment and the Chain Belt Co., that city, has closed on presses. Shipments to the domestic trade from the governmental warehouse at the Symington-Chicago Corp., have been delayed owing to the attention given to shipments to Belgium, which now are going forward. About 300 tools are involved.



New Departure Co. Closes on $1,000,000 List

EASTERN machine tool sellers are expressing considerable satisfaction over the volume of business now coming out. Miscellaneous inquiries are noted in good number, and buying is featured by the placing of some large orders. The New Departure Mfg. Co. is closing on a list valued at more than $1,000,000 and the Standard Oil Co. is buying considerable equipment for export to Roumania. The list had been pending for some time and in all represents approximately $400,000. In addition, the Standard Oil Co., through its subsidiaries, is in the market for about $90,000 worth of machine tool equipment for Mexico and Peru.

While exporters assert that inquiry is not what it was two months ago, they claim that actual buying has increased. In addition to the buying by the Standard Oil Co. mentioned, there have been several sizable orders placed. A shipbuilding company in Spain has awarded contracts in this country during the past week or so for approximately $30,000 worth of equipment, including some fabricating tools, and a private manufacturer in Brazil has recently closed on a considerable list of machinery. Some scattered buying has been done by the railroads in Argentina. At the present time, the Brazilian railroads are issuing small inquiries for machine tools.

In Chile, German machine tool builders are again figuring in the requirements of that country, according to American representatives. During the war, German manufacturers were black-listed. While some business has gone to Germany, machine tool builders in this country have been in receipt of some scattered orders from Chile, and recently several locomotive cranes were placed with an American builder. Chile is inquiring for additional locomotive cranes.

Trading in the eastern crane market continues rather

The Protection We Offer to You

Our immense stock assures users of ***Ludlum Tool*** Steels, prompt and dependable service of a consistently uniform product.

Manufacturers of twist drills and milling cutters are particularly fortunate in having the protection of Ludlum Steel Stock piles—for do you know that Ludlum Steels have been selected by the majority of large users and twist drill and milling cutter manufacturers as the steel best suited for their purposes?

Let us quote on your requirements.

Ludlum Steel Company

General Office and Works
WATERVLIET, N. Y.

Branch Offices:
Chicago, Cambridge, Mass., Detroit, Buffalo, New York City, Cincinnati, Cleveland, Philadelphia, Pittsburgh

restricted, although a fair amount of business is being placed. The Sun Shipbuilding Co., Chester, Pa., placed its inquiry for several overhead cranes with the Pawling & Harnischfeger Co., Milwaukee. The Eastern Potash Co., 120 Broadway, New York City, awarded a 25-ton overhead crane, with 56-foot span, for New Brunswick, N. J., to the Champion Engineering Co., Kenton, O. The Tidewater Iron Works, Hoboken, N. J., bought a 7½-ton crane, with 48-foot span, from the Bedford Foundry & Machine Co., Bedford, Ind. Another Hoboken concern, W. & A. Fletcher & Co., bought a 20-ton crane from the Ohio Locomotive Crane Co., Bucyrus, O. It is expected that a large list of overhead cranes for the Union Shipbuilding & Dry Dock Co., Baltimore, will be placed shortly through the McClintic-Marshall Co., Pittsburgh. Dwight P. Robinson & Co., 61 Broadway, New York City, consulting engineers, are inquiring for a 50-ton overhead crane for the Pennsylvania Service Corp., Philadelphia. The Eastern Foundry Co., South River, N. J., is to build a $100,000 foundry.

Coal Strike Affects Chicago Industry

WITH the coal strike causing a famine in Chicago which has led to actual closing of a majority of industrial concerns and much the same conditions obtaining in all territory west and north, a decided hesitation is evident in the buying of machine tool equipment. This intensifies the usual lull that comes on the approach of the holidays and inventory season. Yet business is by no means poor and with deliveries much delayed on the part of builders of machine tools it is difficult to place business for anything like prompt delivery. Railroads have not yet changed their attitude as to buying the tools they need.

Shipments of machinery from the government's store at the Symington-Chicago Corp. plant to Belgium are going forward, about 300 pieces being involved. This is delaying greatly the shipment of machinery to domestic users from the same source. The Nash Motors Corp. has bought further for the production equipment of its Milwaukee plant and the Chain Belt Co., Milwaukee, has bought some presses.

The American Foundry Equipment Co., Chicago, will build a machine shop. The Doehler Die & Casting Co., Chicago, is building a plant. The Ursus Motor Co., Chicago, is building the first unit of a large plant. The Crawfordsville Foundry Co., Crawfordsville, Ind., will build a foundry and machine shop.

Buyers Postpone Action Until 1920

EXHAUSTED 1919 machinery budgets of several machine tool buyers in the Cleveland territory have removed them from the market until 1920. They are telling dealers' representatives that although they need the equipment, they will not buy until after Jan. 1. The coal strike is not seriously affecting trade, although some few prospective purchasers of machinery are timid and will not close while others who do close buy one tool here and another there. It is thought this is an effort to obtain better deliveries, which for the most part on new tools are deferred many weeks. One Cleveland dealer with branches in Dayton, O., and Detroit, stated last Monday: "We have more unfilled orders on our books than at any time in our history; some of the business is booked for delivery in July and August of next year. Inquiries are plentiful and buying is frequent. If the labor situation were stabilized our large warehouse stock would be cleaned up quickly, so anxious would buyers be to obtain equipment."

One of the largest inquiries current in Cleveland is a list issued by the Van Dorn Iron Works, 3685 East Seventy-ninth street, that city. This has an aggregate value of $100,000 and the equipment is understood to be for an addition to cost $300,000. The Lakeside Forge Co., Erie, Pa., is obtaining quotations on several Bradley hammers. A large list also is expected soon from the General Electric Co., that city, in view of its recent announcement that a huge machine shop is to be built in its effort to make the Erie plant second only to the Schenectady, N. Y., works. An inquiry, current in Dayton, O., related to the automotive industry, calls for between 60 and 70 machine tools valued at between $300,000 and $400,000. The Zigler Mfg. Co., Alexandria, Ind., is in the market for several automatics, and a Cincinnati dealer, the Seifreat-Woodruff Co., is endeavoring to locate five or six inclinable punch presses, either new or used, equivalent to No. 20 Bliss, for one of its customers, who requires the equipment quickly. The Forest City Forge & Machine Co., and the Columbia Axle Co., Cleveland, are understood still to be in the market for some equipment and the B. F. Goodrich Co., is one of the Akron, O., companies which is holding off placing its orders. The Central Aluminum Co., Canton, O., has completed its addition and wants a spinning lathe and a toggle press. The Plymouth Stamped Metal Co., Plymouth, O., will require additional equipment for installation in its plant when it moves to Galion, O. The Findlay Engineering & Mfg. Co., Findlay, O., has purchased the plant of the Findlay Iron & Coal Co., to increase its output of automobiles, truck and tractor parts. It will require additional machining equipment. The Standard Oil Co. is buying crane and other equipment elsewhere than in Cleveland, for its Toledo, O., refinery which is scheduled to be the largest refinery in the world. Coal will be used for fuel since it cannot afford to use oil; the by-products, etc., it will obtain from the oil will more than pay for the coal. The Foote-Burt Machine Co., Cleveland, is about to close on its list of 17 small cranes, mentioned last week, but so far as can be learned, it has not lined up its machine tool requirements for its large new plant, now being built. Some activity is expected soon on the part of the Torbensen Axle Co., Cleveland, which recently was purchased by Willys interests at Toledo, O. The Marsh Motor Car Co., Cleveland, is endeavoring to obtain some equipment and is advertising for a second hand 20 or 30 horsepower slide valve steam engine. This company plans to manufacture passenger automobiles.

While an increase in prices shortly after Jan. 1, would not be much of a surprise in some quarters, the only advance noted recently is on one line of woodworking machinery, including spinning lathes and accessories. Effective Dec. 1, this was advanced 20 per cent.

Inquiries originating outside of the immediate vicinity of Cleveland are of interest to some sellers in that locality. The William H. Haskell Mfg. Co., Pawtucket, R. I., has issued a partial list of its equipment requirements for its new 2-story machine shop, 80 x 140 feet. It calls for one 48 x 48-inch x 12-foot and one 36 x 36-inch x 10-foot planer; one 42-inch vertical and one horizontal boring mill; one small upright and one radial drill; one tool room and one large milling machine; one large and one tool room shaper; one plain grinder; one 16-inch x 6-foot tool room and two 16-inch x 8-foot lathes, as well as pattern shop machinery and machine shop furniture. Before long the Beck & Corbitt Iron Co., St. Louis, will be in the market for electric-driven machinery as follows: Two 15-ton and one 10-ton electric traveling cranes with 75-foot span, the latter to have a lifting magnet. In addition one 84-inch plate shear for

Master Craftsmen

FARRELL-CHEEK

STEEL CASTINGS

MEMBER OF

The perfection of the casting depends very largely upon the core maker—

Therefore we employ masters of the art who with their skilled fingers perform miracles out of so simple a medium as sand, water and our special compound—

The same skill goes into each separate process—

Do you wonder then at Farrell-Cheek prestige?

Farrell - Cheek Steel Foundry Co.

"Makers of Steel Castings that are a little better than the next best."

Sandusky, Ohio

F·C

Say you saw it in THE IRON TRADE REVIEW

1¾-inch plates; one 48-inch sheet shear for No. 8 or No. 10 gage sheets; one bar and angle shear, with capacity for angles up to 6 inches and up to 6 x 1-inch bars, and one cold saw and table for cutting structural shapes, also will be required. The E. J. List Mfg. Co., Havana, Ill., has issued a list which covers screw machines, drilling and grinding equipment, etc. A large list of machine tool and other equipment needs, now is in course of preparation by the Tabor Mfg. Co., Philadelphia, which has moved its plant. The Birdsboro Foundry & Machine Co., Birdsboro, Pa., placed contracts recently for a machine shop, which it will equip shortly to machine castings up to 50 tons in weight. Another list which is expected soon is that of the Wills Automobile Co., Marysville, Mich., plant of which is to be on a producing basis June 1, 1920. Representatives were in Cleveland last week calling on machinery dealers but it is understood that any inquiry issued only is tentative. Some heavy equipment doubtless will be purchased by the Connell-Erben Body Corp., Scranton, Pa., which is erecting a building to manufacture truck bodies. The Jackson Metal Products Co., Jackson, Mich., will buy additional equipment in all probability for its new addition comprising 17,000 square feet of floor space which is to double its output. Punch shop equipment will be bought by the Kent Steel Co., Scribner avenue, Grand Rapids, Mich., for its new punch shop.

Others who are expected to issue lists soon include the Cleveland Worm & Gear Co., East Fortieth street, Cleveland, which recently purchased the property fronting on East Forty-first street, immediately in the rear of its present plant; and the Crawfordsville Foundry Co., Crawfordsville, Ind.; Barnes Mfg. Co., Massillon, O.; Mead Pulp & Paper Co., Dayton, O.; Bucyrus Machine & Tool Co., Bucyrus, O.; Wm. Dennick & Co., Dayton, O.; all of whom are to build machine shops. Should the Briggs Mfg. Co., East 131st street and Taft avenue, Cleveland, commence the building of automobile bodies, in its new 6-story addition, 100 x 176 feet, it will probably require presses, etc.

Crane Business Fair in Pittsburgh

ORDERS for cranes in the Pittsburgh district bulk small in comparison with the number of inquiries which have been out for some time and those which recently have been made. The Jones & Laughlin Steel Co., Pittsburgh, recently closed with the Alliance Machine Co., Alliance, O., for a 5-ton crane for its South Side works and a 20-ton crane for its ore-roasting plant in Minnesota. The Heppenstall Forge & Knife Co., Pittsburgh, has closed for a crane with the Roeper Crane & Hoist Co., Reading, Pa., while the Pennsylvania railroad, lines west, has bought a hoist for its Crestline, O., shops from the Detroit Hoist & Machine Co., Detroit. The Canonsburg Steel & Iron Works has placed a 25-ton crane, with 5-ton auxiliary with the Pawling & Harnischfeger Co., Milwaukee.

New crane inquiries include eight mill type cranes for the Vandergrift, Pa., works of the American Sheet & Tin Plate Co., 10 cranes for the Essington, Pa., plant of the Westinghouse Electric & Mfg. Co., East Pittsburgh, Pa. Request for bids has gone out for 17 cranes for one plant, but the identity of the prospective buyer is withheld, probably because only a few have been asked for prices and they do not want to increase competition for the business. Revised bids have been asked on the cranes for the new plant of the Follansbee Bros. Co., Pittsburgh, at Toronto, O., and as these have not all gone in yet, the award probably will be delayed. With the coal shortage slowing down industrial activity and the end of the year in sight, a quiet period appears to be immediately ahead.

Construction and Equipment

Concise and Timely Business Building Opportunities from the Field of Industry

Among New England Plants

BIDDEFORD, ME.—Plans are being drawn for a 100-foot extension to the machine shop of the Saco-Lowell Shops branch.

BELLOW FALLS, VT.—The Vermont Farm Machine Corp. has been incorporated with $1,200,000 capital to take over the Vermont Farm Machine Co., by Nathan G. Williams, James S. Williams, Glastonbury, Conn., J. A. Pearson and H. J. Searles.

BOSTON.—The Mullin Body Corp. plans a plant addition, 1-story, 170 x 560 feet, to cost $600,000.

BOSTON.—Plans are being drawn for a 1 and 2-story, 241 x 331-foot warehouse for the American Radiator Co., Chicago.

BOSTON.—The Metal Products Co. of New England has been incorporated with $90,000 capital by David H. Coolidge, Frederick H. Cowles and R. M. Russell.

BOSTON.—The American Textile Machinery corp. has been incorporated with $10,000 capital by S. F. Johnson, Bartlett Harwood and O. W. Haussermann.

BOSTON.—The Crucible Furnace Supply Co., Inc., has been incorporated with $50,000 capital by Leon L. Faux, Manfred E. Miller, Cambridge, Mass., and Thomas E. P. Wilson.

BOSTON.—The W. T. Fisher Co., Inc., has been incorporated to deal in machinery with $50,000 capital by William T. Fisher, Milton, Mass., James Wilkinson and E. J. Wilkinson.

BOSTON.—The Stone & Webster Engineering Corp. has the contract to build a 1 and 2-story, 241 x 331-foot warehouse for the American Radiator Co., Chicago. The building will cost $1,500,000.

BOSTON.—The Oil Wells Renewal Co. has been incorporated to make electrical heating appliances with $250,000 capital by P. Frederick Brine, E. M. Pollard, Cambridge, Mass., and George S. Holister.

BOSTON.—The Petroleum Heating & Power Co. has been organized with $2,000,000 capital and has taken over the Fess Rotary Oil Burner, Inc. The officers are: President, F. L. Ames; vice presidents, Robert Adamson and W. C. McTarnahan; treasurer, F. Murray Forbes.

CAMBRIDGE, MASS.—Charles M. James, 444 Main street, has plans for a factory and machine shop, 1-story, 125 x 150 feet, to cost $35,000.

EAST BOSTON, MASS.—Bids closed Dec. 8 for a 2-story and basement, 80 x 245-foot plant for the Boston & Lockport Block Co.

FALL RIVER, MASS.—The Empire Machine Works, Inc., has been incorporated with $15,000 capital by John B. Quinn, Francis J. Quinn and William T. Nickerson.

FITCHBURG, MASS.—Crocker, Burbank & Co. will build an iron storehouse.

FITCHBURG, MASS.—Bids have closed for a 2-story storehouse, to cost $75,000 for the Simonds Mfg. Co.

GARDNER, MASS.—The Gardner General Foundry Co. will build a foundry, 50 x 130 feet, to replace one burned some time ago. It will be equipped with two 5-ton and four 2-ton traveling cranes. The cupola building will be extended 40 x 46 feet.

NORFOLK DOWNS, MASS.—The Pneumatic Scale

Corp., Ltd., has let a contract for a 3-story, 70 x 150-foot office and factory building, to cost $50,000.

PEABODY, MASS.—The A. C. Lawrence Leather Co. plans a 3-story building for its mechanical department.

QUINCY, MASS.—The Bethlehem Shipbuilding Corp., Ltd., has let a contract to P. McGovern & Co., New York, for a 5000-ton floating drydock at its Fore River yard.

SPRINGFIELD, MASS.—Permit for construction of the second unit of the Stevens-Duryea Co.'s plant has been issued. The building will be 200 x 300 feet.

SPRINGFIELD, MASS.—The C. H. Smith Corp. has been incorporated to make rolls and machinery with $5000 capital by Clinton E. Bell, H. B. Lowe and V. A. Converse.

SPRINGFIELD, MASS.—The city will erect a 3-story and basement, vocational high school to contain a machine shop, tool department and sheet metal workers department.

TAUNTON, MASS.—Albert F. Lincoln & Co. have let the contract for a 1-story, 40 x 150-foot machine shop and factory, to be devoted to the manufacture of small tools.

TURNER FALLS, MASS.—Bids have closed for a one-story machine shop for the Martin Machine Co.

WILLIMANSETT, MASS.—The Stevens-Duryea Co. has let the contract for a 300 x 320-foot factory, the second unit of a 20-acre plant. The third unit will be 320 x 760 feet.

WORCESTER, MASS.—The American Steel & Wire Co. is to build a new 20 x 100 foot machine shop.

WORCESTER, MASS.—The Morgan Construction Co. has let the contract for an addition, two stories, 45 x 97 feet.

WORCESTER, MASS.—The Hobbs Lock Washer Co. is expected to be organized here soon with a capital stock of $50,000.

WORCESTER, MASS.—The Worcester Machine Works, Inc., will erect a plant next spring to contain 60,000 square feet.

WORCESTER, MASS.—The Worcester Abrasive Co. has been incorporated with $10,000 capital, by Alfred J. Pearson, Arthur C. Hedlund and O. G. Hedlund.

WORCESTER, MASS.—The Walden-Worcester, Inc., maker of wrenches, has let the contract for a 1-story, 132 x 173-foot factory and boiler house, to cost $38,000, this being the second unit of its new plant.

PAWTUCKET, R. I.—The Rhode Island Crucible Steel Co. has purchased a tract of land here and will remove its present plant to the new location.

PROVIDENCE, R. I.—The R. I. Body Co. has been incorporated to build vehicle bodies with $10,000 capital by Phillip Harris, Hyman Sarkin and Abraham Luff.

PROVIDENCE, R. I.—The Master Tool Co. has been incorporated to make tools with $25,000 capital by Joseph Duplessie, Henry C. Hart and William D. Grady, Woonsocket, R. I.

BRIDGEPORT, CONN.—The Star Auto Machine Co. has been incorporated with $5000 capital by Soren Rosenbeck, D. E. Rosenbeck and F. E. Hubbs.

BRIDGEPORT, CONN.—The Crane Co., Chicago, has let a contract to the Stone & Webster Engineering Corp., Boston, for a 3-story, 80 x 500-foot combined manufacturing and foundry building at its west end plant.

DANBURY, CONN.—The Ball & Roller Bearing Co. will build a 2-story, 50 x 75-foot addition.

HARTFORD, CONN.—The Whitney Machine Co. contemplates a plant at an estimated cost of $82,000.

HARTFORD, CONN.—Bids have closed for a 98 x 194-foot factory to cost $65,000, for the Hartford-Fairmount Co., builder of machinery.

HARTFORD, CONN.—Reconstruction of the Hartford Rubber Works division of the United States Tire Co. has recently been announced by C. B. Whittlesey, president of the local plant.

HARTFORD, CONN.—The Merrow Machine Co. has recently purchased property, and although officials of the company have made no definite statement, it is understood that a factory addition will be erected.

HARTFORD, CONN.—The L. & L. Automobile Accessories Corp., has been formed here to manufacture automobile parts. The capital stock is $25,000. The incorporators are Lewis L. Libby, Florence L. Libby, and Joseph Albani.

MERIDEN, CONN.—Wolfs Abrasive Wheel Co. has been incorporated with a capital of $400,000.

MERIDEN, CONN.—The Manning Bowman Co., nickel and silver plated ware, has let the contract for a 5-story, 50 x 130-foot factory addition.

NEW BRITAIN, CONN.—The Eastern Malleable Iron Co. will erect a building.

NEW BRITAIN, CONN.—The Fafnir Bearing Co. has let a contract for a 51 x 137-foot addition to cost $97,000.

PHILLIPSDALE, R. I.—The Washburn Wire Co. has been incorporated with $1,500,000 capital, by Albert R. Palmer, Madison, N. J., Frank R. Serles, East Orange, N. J. and George F. Handel, New York.

THOMASTON, CONN.—Bids have closed for a 3-story and basement, 90 x 100-foot factory to cost $40,000 for the Waterbury Jewell Co.

WATERBURY, CONN.—The Manufacturers Foundry Co. will build a 100 x 153-foot addition.

WATERVILLE, CONN.—The American Pin Co. is considering plans for a 4-story building.

North Atlantic States

ALBANY, N. Y.—The Cox Brass Mfg. Co. plans a factory buildnig, 2-stories, 38 x 46 feet.

ALBANY, N. Y.—The White Service Station & Motor Co. plans a salesroom and machine shop.

ALBANY, N. Y.—B. Hennessey has had plans drawn for a machine and repair shop, 1-story, 124 x 153 feet.

BATH, N. Y.—The property of the Bath Machine Works Co., which has not been operated for sometime, has been purchased by R. H. Hood, of Rochester N. Y.

BATH, N. Y.—The United States Hammered Piston Ring Co., Inc., machine shop and foundry, has been incorporated with $25,000 capital, by U. H. Frey, J. C. Frey and J. S. Frey, Hammondsport.

BROOKLYN, N. Y.—The Couch Haas Motors Corp., 1537 Bedford avenue, plans a factory building, 2-stories, 80 x 185 feet.

BROOKLYN, N. Y.—The Bay Machine Co. has been incorporated with $50,000 capital, by J. A. Clymes, T. E. Shea and P. J. McGrath, 145 East Eighty-second street.

BROOKLYN, N. Y.—The American Macaroni Dies, Inc., dies and metal plates, recently was incorporated with $5000 capital, by A. Battista, P. Gardone and O. Scallisi, 930 Fifty-sixth street.

BUFFALO.—The Guilford Mfg. Co., 225 Guilford street, has had plans drawn for a boiler room.

MIDDLETOWN, N. Y.—T. E. Reinhalter Corp., machine shop, recently was incorporated with $50,000 capital, by D. E. Stuart, W. L. Maguire and Peter Reinhalter.

NEW YORK.—The Wilkie & Carbonic Gas Co. plans a power house.

NEW YORK.—This city plans alterations to a boiler plant at Blackwells Island.

NEW YORK.—The J. L. Mott Iron Works, Inc., has had plans drawn for alterations to its plant.

NEW YORK.—The Pan American Iron Works, Inc., recently was incorporated with $10,000 capital, by M and A. Horowitz and J. Bond, 515 East 138th street.

NEW YORK.—The Presto Gas & Blower Iron Mfg. Co. has been incorporated with $10,000 capital, by J. Kornbluh, T. Podelsky and L. Pivnik, 75 East 111th street.

NEW YORK.—The Independent Gas & Electric Fixture Co. has been incorporated with $15,000 capital, by H. Goldberg, I. and R. Clar, 528 East 149th street.

NEW YORK.—The Climax Smelting & Refining Co. recently was incorporated with $10,000 capital, by S. Blumenfeld, A. Miller and M. Yockers, 1 Madison avenue.

NEW YORK.—The Begley Mechanical Corp., electrical devices, has been incorporated with $300,000 capital, by W. J. Begley, E. W. Ernst and F. P. Hennessy, 200 West Twenty-third street.

NEW YORK.—The Acetylene & Electric Welding Machine Co. has been incorporated with $11,000 active capital, by R. E. Polhemus, L. Scheuer and S. Dannenberg, 407 East Fiftieth street.

NEW YORK.—The Standard Button Machine Co., machinery and tools, recently was incorporated with $100,000 capital, by J. E. Griswold, H. P. Livermore and A. P. Nevin, 30 Church street.

ROCHESTER, N. Y.—The American Laundry Machine Co. plans a machine shop, 2-stories, 161 x 198 feet.

SYRACUSE, N. Y.—Plans have been completed for the organization of the Franklin Die Castings Corp., with a capital of $1,000,000. Howard L. Franklin, brother of H. H. Franklin, president of the H. H. Franklin Mfg. Co., is to be president; Holbert C. Skinner and C. E. Hull, vice president, and secretary and treasurer, respectively. It is the intention of the company to erect or acquire a new plant.

UTICA, N. Y.—The Muson Mill Machinery Co. contemplates a factory building, 2-stories.

WHITEHALL, N. Y.—The Adirondack Machine Co. recently was incorporated with $20,000 capital, by J. J. Doran, D. E. Brett and E. M. Finch.

BIRDSBORO, PA.—The Birdsboro Foundry & Machine Co. has placed contracts for an extension to its machine shop, 60 x 187 feet.

ERIE, PA.—The Eric Art Metal Co. will build an addition, 120 x 190 feet.

FREELAND, PA.—The Freeland Chamber of Commerce is to aid the Freeland Foundry & Machine Co., whose plant was damaged by fire some time ago.

IRWIN, PA.—The Pittsburgh Reflector & Illuminating Co., Pittsburgh, will build a plant here.

NEW CASTLE, PA.—The Bacon Motor Corp. has been organized with $1,500,000 capital to manufacture passenger cars, and has purchased a 21-acre site here on which it plans to erect a plant. F. C. Van Der Loof, Butler, Pa., formerly in charge of the automobile department of the Standard Steel Car Co., is president and F. W. Bacon, this city, is vice president.

PHILADELPHIA.—Work will be undertaken at once by the Wicaco Screw & Machine Works on a one and 2-story factory addition, 82 x 206 feet.

PHILADELPHIA.—A total of $2,500,000 will be expended by the Philadelphia Electric Co. on a power house. The building will be 1-story, 130 x 197 feet.

PHILADELPHIA.—The Philadelphia Storage Battery Co. has awarded the Stewart Bros. Co. a contract for a 3-story plant addition, 50 x 219 feet, with an ell, 26 x 50 feet.

PHILADELPHIA.—The Standard Tin Foil Corp. has awarded a contract to the Orson Co., for a $200,000

factory building. The structure will be 2-stories, 130 x 260 feet.

PHILADELPHIA.—The Wright Roller Bearing Co. has awarded the general contract for a $10,000 plant addition to the H. John Homan Co. Plans call for a building 1-story, 50 x 80 feet.

PITTSBURGH.—The Macbeth-Evans Glass Co. has let the contract for a machine shop and pattern shop.

PITTSBURGH.—The Mayer Wagon Co. plans a plant addition, 3-stories, 49 x 112 feet, to cost $50,000.

PITTSBURGH.—The Conley Car Co., tank cars, recently was incorporated with $25,000 capital, by Joseph H. Holmes, F. G. Conley and John O. Burgwin.

PITTSBURGH.—The Green River Gas Co. has been incorporated with $100,000 capital, by J. Hartman Jr., W. P. McNellie, H. J. Gallagher, H. Adams and J. Cheuvront.

READING, PA.—Part of the Orr, Painter & Co.'s Reading Stove Works recently was damaged by fire.

READING, PA.—A. Lincoln Frame, 403 South Fifth street, plans an addition to his foundry, 60 x 92 feet, to cost $22,000.

READING, PA.—The Gray Iron Foundry Co. has placed a contract for a foundry extension to cost $22,000. A. L. Frame is president.

READING, PA.—The Birdsboro Steel Foundry & Machine Co. has placed contracts for an addition to its machine shop. The building will be 60 x 187 feet.

SHARON, PA.—The Savage Arms Corp. will build a $50,000 plant and a power house.

JERSEY CITY, N. J.—The Drop Forge Co., Westside avenue, has let a contract for a 4-story plant to cost about $50,000.

JERSEY CITY, N. J.—The American Platinum Works, 231 North Jersey Railroad avenue, plans a factory and boiler house.

MILLVILLE, N. J.—The Millville Cast Iron Products Co. plans a foundry, 50 x 150 feet, and other improvements.

MONTCLAIR, N. J.—J. D. Mackridge, Inc., 21 Greenwood avenue, has been incorporated with $100,000 capital to manufacture motor vehicles and motors, by Robert Kayser, John and Florence C. Sulzberger.

NEWARK, N. J.—Work will begin in the spring on a factory building for the Aeolian Co.

NEWARK, N. J.—The Seton Leather Co. plans a factory building and boiler house to cost $40,000.

NEWARK, N. J.—The Rubber & Celluloid Products Co., 55 Ferry street, has plans for a boiler and pump house.

NEWARK, N. J.—A 46 x 57-foot boiler house and engine room will be erected at the plant of Kaltendach & Stevens, Inc.

NEWARK, N. J.—The Simon-Gartler Corp. has been incorporated with $125,000 capital to manufacture skylights, cornices, sheet metal structures, etc.

NEWARK, N. J.—The Tanners Machinery Co., 42 Kent street, has been incorporated with $100,000 capital, by Anna B. Spiegel, James Brown and Charles J. Hanke.

NEWARK, N. J.—Plans are being considered by the Autocar Co., Ardmore, N. J., for a large service station and distributing plant in this city. It is stated that the building will be 1-story, 200 x 412 feet.

NEWARK, N. J.—The American Writing Machine Co., a subsidiary of the Remington Typewriter Co. has acquired the building at Central avenue and Fourth street, to which it will remove the equipment at its present plant on Mulberry street.

NEW BRUNSWICK, N. J.—The Middlesex Motors, Inc., 175 Smith street, Perth Amboy, N. J., recently was incorporated with $30,000 capital, by Leo B. Wolfe, Edward Miller and Frank Stas.

PHILLIPSBURGH, N. J.—The Hull Battery & Ignition Co. has been incorporated with $70,000 capital, by R. N. Fulton, G. T. Hull and J. M. Cady.

SOUTH RIVER, N. J.—The Eastern Foundry Corp. has been incorporated to manufacture piano plates, etc.

SOMERSET, MD.—The plant of the Somerset Highland Foundry Machine Co. recently was damaged by fire. The loss has been estimated at $30,000.

In The South

CLARKSVILLE, TENN.—The Red River Co. has been incorporated with $100,000 capital to mine minerals and manufacture pig iron, by H. N. Leech, Graham Macfarlane, L. C. Nesbet and Callis Tate.

KNOXVILLE, TENN.—The Dixie Machinery Co., Inc., recently was incorporated with $10,000 capital, by E. W. Gillespie and others.

MEMPHIS, TENN.—The Liberty Cotton Chopper Co. has been incorporated with $100,000 capital, by F. R. Hansell and others.

MEMPHIS, TENN.—The Memphis Leland Lock Co. has been organized to manufacture automobile locks, by Frank B. Folsom and others.

NASHVILLE, TENN.—The York Starter Co. has been incorporated with $25,000 capital, by W. L. York, B. U. Taylor, O. R. York, J. F. Shaw and others.

SOUTH PITTSBURG, TENN.—The South Pittsburg Foundry Co. is reported planning a plant addition, 50 x 200 feet.

CHARLOTTE, N. C.—Alexander & Garsed, cotton-mill machinery, plans a building to cost $10,000.

FAYETTEVILLE, N. C.—A $200,000 woodworking plant will be erected here by the Jackson Bros. Co.

HIGH POINT, N. C.—The Bar Spring Co. recently was incorporated with $125,000 capital, by John H. Welborn, William H. English and others.

KINSTON, N. C.—The Kinston Iron & Mantel Works will erect two buildings, 50 x 80 feet and 40 x 60 feet.

TARBORO, N. C.—The Eclipse Harrow Mfg. Co. has been incorporated with $100,000 capital, by M. G Mann, T. T. Thomas and M. S. Brown.

COLUMBIA, S. C.—The Whitton Air Jack Co. has been incorporated with $10,000 capital, by W. B. Whitton and others.

FLORENCE, S. C.—The Eagle Machine & Mfg. Co. recently was incorporated with $20,000 capital, by L. W. Broadfoot and others.

AMERICUS, GA.—The W. H. Sawyer Sons Co. plans to rebuild its plant which was damaged by fire to the extent of $75,000.

ATLANTA, GA.—The Railway Lock Spike Co. recently was organized with $300,000 capital, by J. F. Pickard, H. E. Harris and R. R. Lanham.

SAVANNAH, GA.—J. F. and J. E. Weeks will equip a plant for the manufacture of metallic caskets.

BESSEMER, ALA.—The Beggs Foundry Co. recently was incorporated with $3000 capital, by Oscar Cochranel, P. J. Beggs and others.

BIRMINGHAM, ALA.—The Birmingham Machine & Foundry Co. plans a machine shop addition.

BIRMINGHAM, ALA.—The Vulcan Rivet Co. recently was incorporated with $75,000 capital and contemplates enlarging a plant which it has taken over.

GREENVILLE, MISS.—The Riverside Transmision Co. recently was incorporated with $7000 capital, by R. B. Claggett and others.

JACKSONVILLE, FLA.—The Southern Automatic Machine Co. recently was incorporated with $10,000 capital, by R. H. Tresca and others.

SHREVEPORT, LA.—The Acme Oil & Drill Co., J. D. Pace president, is equipping a plant for turning out its products including drop forging equipment, heating furnaces and power hammers.

Throughout the West

MINNEAPOLIS.—The Russel Grader Mfg. Co. plans a factory and warehouse, to cost $75,000.

MASON CITY, IOWA.—The Mason City Foundry & Machine Co., recently was incorporated with $30,000 capital, by R. E. Wilcox, L. G. Dreyer and others.

WATERLOO, IOWA.—George B. Miller & Sons contemplate a plant to include a foundry.

ST. LOUIS.—Henry P. Mueller, 215 Lombard street, has plans for a foundry, to cost $100,000.

ST. LOUIS.—The Standard Stamping Co., 200 North Broadway, is reported planning a machine shop, 1-story, 24 x 41 feet, to cost $10,000.

ST. LOUIS.—John Nauman, care of the Urizda Realty Co., 4012 Choteau avenue, contemplates an automobile accessory plant, to cost $40,000.

ST. LOUIS.—The Wagner Electric Co. will build an additional plant five stories, 60 x 400 feet, with two wings each 60 x 60 feet, costing $44,000.

AUSTIN, TEX.—The Paris-Hugo Bridge Co., capitalized at $100,000, will build a bridge across Red river near Arthur City, Tex. E. M. McGlasson is one of the incorporators.

DALLAS, TEX.—Work of laying the ofundation for the new Dallas Machine & Locomotive Works has been started. The plant will be built at an estimated cost of $35,000.

EASTLAND, TEX.—The Howard Tool Works has been incorporated with $50,000 capital, by D. M. Howard, P. S. Wolfe and H. L. Durlin.

RANGER, TEX.—The Crescent Sheet Metal Co. recently was incorporated with $10,000 capital, by F. E. Skinner, W. E. Skinner and A. M. Fitzgerald.

CARNEGIE, OKLA.—An election will be held Dec. 16 on $24,000 in bonds for waterworks extensions.

OMAHA, NEBR.—The Carter Sheet Metal Works, 108-12 South Tenth street, is reported planning a plant, 1-story, 132 x 162 feet, to cost $20,000.

SIOUX FALLS, S. DAK.—An election will be held Dec. 9 to issue $375,000 in bonds for waterworks construction and $175,000 for a sewer system.

DEVILS LAKE, N. DAK.—The Northwestern Iron Works contemplates a plant to include a machine shop, foundry, pattern shop, tin shop, blacksmith shop, etc.

ORNICO, NEV.—The 100-ton mill of the Olympic Mines Co. recently was damaged by fire. The loss has been estimated at $70,000.

PHOENIX, ARIZ.—Bids will be taken soon for a pipe line to cost $1,000,000. H. J. Phillips, St. Louis, is consulting engineer.

Central States Activity

JANESVILLE, WIS.—The Samson Tractor Co., now erecting a large foundry, has announced plans for two others of similar dimensions.

MILWAUKEE.—The Atlas Foundry Co. will erect a plant addition, 80 x 80 feet, at an estimated cost of $20,000.

MILWAUKEE.—The Gemco Mfg. Co., G. F. Disher president, 742 South Pierce street, will build a plant costing $50,000.

MILWAUKEE.—The Worden-Allen Co. has the contract to construct new buildings for the Newport Co. manufacturer of coal tar products.

MILWAUKEE.—The Nordberg Mfg. Co., engines and pumping equipment, has awarded contracts for a 1-story machine shop addition, 100 x 120 feet, to cost $100,000.

MILWAUKEE.—Contracts have been awarded by the Milwaukee Auto Engine & Supply Co. for a 1-story machine shop, 120 x 120 feet, costing $45,000 without machinery.

MILWAUKEE.—The Mid-West Electric Co. has been incorporated with a capital of $50,000 by David, Louis and Anna Cohen to manufacture and deal in electric-motored domestic and industrial appliances.

MILWAUKEE.—The Stowell Co., manufacturer of hardware specialties, has acquired the foundry of the Pelton Steel Co. at Chicago road and Elliot place, and will convert it into a malleable iron unit.

MILWAUKEE.—The Pelton Steel Co. has sold its plant to the Stowell Co., manufacturer of steel and iron castings. It is said the plant will be operated by the purchaser as a branch malleable iron foundry.

RACINE, WIS.—The American Skein & Foundry Co. will enlarge its plant by an addition, 100 x 250 feet.

RACINE, WIS.—The Walker Mfg. Co. has broken ground for a foundry, 120 x 128 feet, to be equipped for light gray iron casting work. The company makes automobile jacks and other accessories.

RACINE, WIS.—Becker, Menzel & Becker, consulting engineers, Baker building, are preparing specifications for improvements in the steam power plant of the Higgins Spring & Axle Co., and also for the Sheboygan (Wis.) Fruit Box Co.

SHEBOYGAN, WIS.—The Globe Metal Products Co. is erecting a foundry and cupola building at an estimated cost of $50,000.

ALPENA, MICH.—The General Engineering Co., John Lundberg, president, will erect a foundry and machine shop, 70 x 80 feet.

BATTLE CREEK, MICH.—Two hundred acres have been acquired for expansion of the Grand Trunk railway machine and repair shops here.

BATTLE CREEK, MICH.—The Advance Pump & Compressor Co. is erecting a foundry, machine shop, power house, testing room, blacksmith shop and warehouse, which will double its capacity.

BENTON HARBOR, MICH.—Plans have been prepared for a foundry addition for the Superior Steel Co. to cost $200,000.

CADILLAC, MICH.—Ground has been broken for the first unit of the new plant for the Kol-Ben Wheel Co. It will be 48 x 156 feet.

DETROIT.—The Gray Motor Co. plans a plant addition, 60 x 160 feet.

DETROIT.—The Commerce Motor Car Co. contemplates a plant addition.

DETROIT.—The Timken-Detroit Axle Co. has let a contract for a second story addition.

DETROIT.—The Hupp Motor Car Corp will erect a power plant and factory at Jackson, Mich.

DETROIT.—The Cut Tap & Die Co. plans a factory and office addition, 1-story, 40 x 48 feet, to cost $15,000.

DETROIT.—Architect Albert Kahn is taking figures on the machine shop unit of the new Paige-Detroit Motor Car Co. plant.

DETROIT.—The McCord Mfg. Co., manufacturer of auto parts, has purchased the plant of the Racine Mfg. Co., Racine, Wis.

DETROIT.—The Krukow Process Tool Co. has been chartered with $20,000 capital and will operate a machine and tool shop.

DETROIT.—Edmunds & Jones Corp., manufacturer of auto lamps, plans extensive plant additions. George E. Edmunds is president.

DETROIT.—The Star Tool & Die Works has been incorporated with $15,000 capital, by Herbert Chartier, 716 Lakewood boulevard, and others.

DETROIT.—The Peninsula Forging, Die & Tool Co. has been chartered with $10,000 capital, by George F. Daschke, 193 Woodward avenue and others.

DETROIT.—The Detroit Weatherproof Body Co. has acquired additional space at Corunna, Mich., for the manufacture of limousine bodies. Other buildings will be erected later.

DETROIT.—W. P. Fleming, Inc., has been chartered with $15,000 capital to manufacture garage equipment and machinery, by F. R. Dentz, 225 Elmhurst avenue and others.

DETROIT.—The Continental Trailer Corp. has been chartered with $50,000 capital to manufacture auto trailers, trucks, etc., by Thomas Steiner, 1499 Townsend avenue, and others.

FILER CITY, MICH.—The Manistee Drop Forge Co. is erecting a new building.

HOLLY, MICH.—The Ground Hog Tractor Co. has been organized with $250,000 capital to manufacture farm tractors. C. F. Megow is president.

JACKSON, MICH.—The American Gear & Mfg. Co. will erect a plant addition, 169 x 280 feet, to cost $180,000.

KALAMAZOO, MICH.—The D'Arcy Spring Co. is completing an addition, 112 x 150 feet.

KALAMAZOO, MICH.—The Dearborn Equipment Co., capitalized at $50,000, recently was organized to manufacture garage equipment, by John H. Penniman and others.

MENOMINEE, MICH.—The Lloyd Mfg. Co. has purchased the plant of the Automatic Welding Co.

MUSKEGON, MICH.—The Shaw Electric Crane Co. contemplates an addition to double the capacity of its plant.

MUSKEGON, MICH.—The Shaw Crane Works contemplates a building campaign to enable the manufacturer of gas engines and machine tools.

SAGINAW, MICH.—The Michigan Crankshaft Co. is erecting a building, 120 x 690 feet.

SAGINAW, MICH.—The Erdman-Guider Co., manufacturer of auto bodies, is installing machinery in its new plant.

CHICAGO.—The Pullman Co., 79 East Adams street, contemplates a shop.

CHICAGO.—The Crane Co., 636 South Michigan avenue, will build a pipe shop, 193 x 375 feet.

CHICAGO.—The Mechanical Equipment Co. will erect a plant, 3-stories, 52 x 125 feet, to cost $60,000.

CHICAGO.—The Powell Steel Kitchen Co., 219 Loomis street, contemplates a factory building, 1-story, 86 x 144 feet, to cost $25,000.

CHICAGO.—The Simplex Windshield Wings Co. has been incorporated with $50,000 capital, by Robert Hartman, Henry Halbritter and Samuel N. Reiback.

EAST ST. LOUIS, ILL.—The Hussman Refrigerator & Butcher Supply Co. plans an office and factory building, 2-stories, 130 x 260 feet, to cost $100,000.

HARVEY, ILL.—The Buda Motor Co. plans a foundry, 40 x 160 feet, to cost $75,000.

JOLIET, ILL.—The Moore Bros. Co., Lewis Moore, president, is reported planning a foundry, 67 x 70 feet, to cost $20,000.

MARION, IND.—The Marion Gray Iron Foundry Co. is reported planning a warehouse, 1-story, 54 x 122 feet, to cost $10,000.

WEST PULLMAN, ILL.—The International Harvester Co., 606 South Michigan avenue, Chicago, contemplates a manufacturing building here.

CONNERSVILLE, IND.—The Lexington Motor Co. contemplates a foundry.

CRAWFORDSVILLE, IND.—The Crawfordsville Foundry Co. will build a foundry and machine shop consisting of three buildings, 1-story, 60 x 80 feet, 2-story, 60 x 80 feet, and 1-story, 20 x 40 feet, costing $20,000.

EVANSVILLE, IND.—The Advance Stove Works plans a foundry addition.

EVANSVILLE, IND.—The Imperial Desk Co. has had plans drawn for a factory and power house.

FT. WAYNE, IND.—The General Electric Co., Broadway and Wall streets, plans a tank, shop and garage, 1-story, 140 x 200 feet, at an estimated cost of $75,000.

HAMMOND, IND.—The American Iron & Metal Co. recently was incorporated with $10,000 capital, by Sam Abalman, John A. Gavit and James K. Stinson.

INDIANAPOLIS.—The Globe-Bosse-Wold Furniture Co. has plans for a power house, 60 x 80 feet.

INDIANAPOLIS.—The Imperial Drop Forge Co., 510 South Harding street, has had plans drawn for a power plant.

INDIANAPOLIS.—The Vonegut Machinery Co. is taking bids for a machinery warehouse, 2-stories, to cost $200,000.

INDIANAPOLIS.—The Robbins Body Corp., capitalized at $2,500,000, has been chartered to take over the plant and business of Irvin Robbins & Co., automobile body manufacturers.

MICHIGAN CITY, IND.—The Sheet Steel Products Co. recently was incorporated with $200,000 capital, to manufacture pressed steel, by Charles E. McBride, D. A. Crawford and K. S. Baxter.

RICHMOND, IND.—The Richmond Piston Ring Co. is reported contemplating a plant to cost $40,000.

SOUTH BEND, IND.—The Lock Joint Tube Co., capitalized at $100,000, has been chartered to manufacture metal tubing by Isadore Van Huffel, Isadore Woodka and Andrew Woodka.

SULLIVAN, IND.—The Mutual Truck Co. will build a 1-story addition, 100 x 300 feet, costing $40,000.

AKRON, O.—The Summit Mold & Machine Co. plans a machine shop to cost $30,000.

AKRON, O.—The Franz Foundry & Machine Co., recently incorporated with $400,000 capital, has taken over the Triumph Machine Shop at Barberton, O., and will manufacture rubber making machinery. C Franz is president.

BUCYRUS, O.—The Ohio Brass Co. has plans for remodeling its foundry.

BUCYRUS, O.—Ground has been broken for an addition to the Bucyrus Machine & Tool Co. The building will be 36 x 120 feet.

CLEVELAND.—The Dangler Stove Co., 5017 Perkins avenue, plans a plant addition, 1-story, 50 x 200 feet, to cost $35,000.

CLEVELAND.—W. K. Smith, 66 Taylor road, East Cleveland, has plans for a foundry and machine shop, 100 x 120 feet, to cost $75,000.

CLEVELAND.—The Merit Machine Co. recently was incorporated with $200,000 capital, by Isador Grossman, N. M. Doehring and others.

CLEVELAND.—The Harvey Steel Products Co. has been incorporated with $120,000 capital, by George Higgins, Thomas H. Jones, Williamson building, W. R. Kinder, James P. Wood and H. O. Jones.

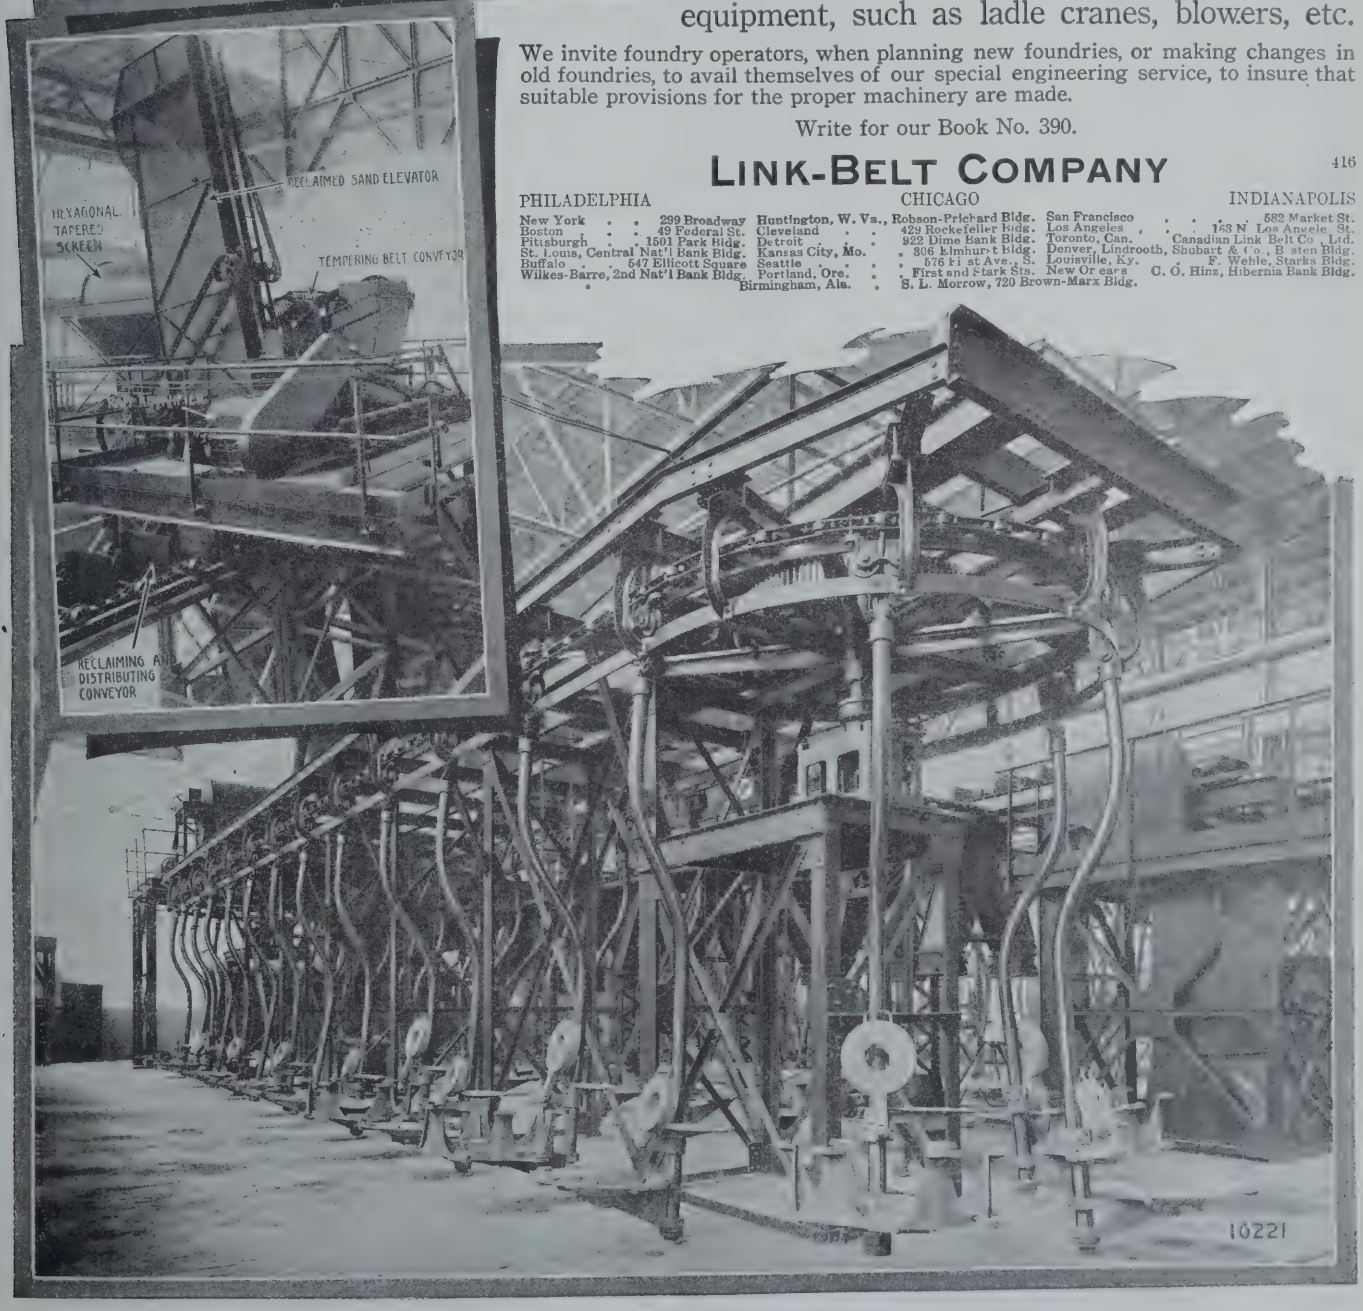
LINK-BELT

Labor-Saving Conveyors for the Modern Foundry



WITH modern Link-Belt Labor-Saving machinery, it is possible to increase the output of the foundry—with less labor. Foundrymen in general are realizing with increasing certainty that machinery of this type, when properly designed and built, and well taken care of, is fully as necessary an adjunct, and as reliable and economical in operation, as any other foundry equipment, such as ladle cranes, blowers, etc.

We invite foundry operators, when planning new foundries, or making changes in old foundries, to avail themselves of our special engineering service, to insure that suitable provisions for the proper machinery are made.

Write for our Book No. 390.

(*Concluded from Page* 1615)

DAYTON, O.—The Mead Pulp & Paper Co. plans a machine shop, 2-stories, 60 x 250 feet.

DAYTON, O.—The Vaile-Kimes Co., pump makers, has reincorporated as a $1,000,000 company. Plans are under way for the erection of a large plant.

DAYTON, O.—New equipment will enter into a 3-story building to be erected by the Stanley Mfg. Co. Company makes perfume bottle labels and thin metal labels for machinery.

DAYTON, O.—The Dayton Tractor Co. has been incorporated with capitalization of $250,000 and plans to manufacture tractors. E. A. Brenneman, Harry Gascho, J. E. Allen, Isaac Warner and A. M. Inderbitzen are the incorporators.

DAYTON, O.—The Miami Brass Foundry and Miami Mfg. Co., each headed by Ben Semmelman, will erect a 3-story plant. The companies have installed core ovens giving capacity of drying 150,000 pounds of sand core per day. New furnace equipment and ten molding machines have been installed.

DAYTON, O.—Educational Toy Mfg. Co., capitalized at $25,000, has decided to locate in Dayton instead of Springfield, Mass., and has taken over the Custer machine shop, 28 North Ludlow street. The company will purchase punch presses and other mechanical equipment. Joseph Vehan, Springfield, Mass., is president, and W. H. Robertson, general manager.

DAYTON, O.—William Dennick & Co., 1415 East Fifth street, manufacturers of heavy and light bronze castings, are erecting a 2-story addition to their foundry, the upper floor to be used as a core room, dressing room and racks for core boxes, while the lower floor will be divided into two sections, one part to be used as an office while the other will be used for machinery and shipping rooms. In addition to the addition, the company is modernizing all its equipment.

MANSFIELD, O.—The Barnes Mfg. Co. plans a machine shop addition, 2-stories, 22 x 126 feet, to cost $30,000.

NEWARK, O.—The Ohio Sash Weight Co. recently was incorporated with $15,000 capital, by M. J. MacDonald, N. E. Hones and others.

NILES, O.—The Kennedy Reiter Co. has been incorporated by Myron Kennedy, Clarence Reiter and others, and will manufacture metal products.

NORTH CANTON, O.—Work on an addition for the Hoover Suction Sweeper Co. is being rushed to completion. The building will be 80 x 170 feet.

TOLEDO, O.—The Acme Specialty Co. plans a manufacturing building, 3-stories, 45 x 100 feet, to cost $45,000.

TOLEDO, O.—The Krenz Boiler Works has been incorporated with $20,000 capital, by Reinhold W. Krenz, M. K. Kureth and others.

WASHINGTON COURT HOUSE, O.—The Fayette Sand & Gravel Co. has been incorporated with $25,000 capital, by G. D. Baker, George A. Hyer, H. C. Hosier and others.

LEXINGTON, KY.—This city proposses to build a sewage reduction plant.

LOUISVILLE, KY.—The Frank Fehr Coal Storage Co. has had plans prepared for a $1,000,000 coal storage plant.

LOUISVILLE, KY.—The Kentucky Color & Chemical Co. has been organized with $70,000 capital by A. W. Clark, G. A. Goodell and others and will build a plant.

LOUISVILLE, KY.—The Byron Engineering Works has been organized by O. E. Byron and others, and plans are being made for a plant to be devoted to the manufacture of truck trailers.

PIKEVILLE, KY.—The Kentucky & West Virginia Power Co. will purchase equipment for its plant.

ASHLAND, W. VA.—The Ashland Coal & Coke Co. will build a $200,000 tipple and mining plant. W. A. Phillips is general manager.

HUNTINGTON, W. VA.—The Stoody Machine Co. has been incorporated with $5000 capital, by C. H. Stoody, J. S. Myers, R. Bias, S. M. Stoody and W. F. Stoody.

MOUNDSVILLE, W. VA.—The United Zinc Smelting Co. contemplates a plant at an estimated cost of $300,000.

MOUNDSVILLE, W. VA.—C. D. Keyser has the contract to erect a plant for the United States Stamping Co.

POWHATAN, W. VA.—The Mohawk Coal & Coke Co. is arranging to make additions to its mining plant.

LOGAN, W. VA.—The Kentucky & West Virginia Power Co. is having plans prepared for a boiler house and power plant additions. H. T. Hartmann, Land Title building, Philadelphia, is general manager.

WARWOOD, W. VA.—The United States Corrugated Fibre Co. will start work early next spring on additions to its plant.

Business in Canada

LAKE TEMISKAMING, QUE.—M. J. O'Brien, Ltd., Union Bank building, Ottawa, Ont., is making arrangements for pulp and paper mills and hydro electric power development here.

LATUQUE, QUE.—The Brown Corp., Ltd., will make improvements to its power plant.

MONTREAL, QUE.—The St. Maurice Power Co., Ltd., has been incorporated to build and operate power plants, hydro electric systems, etc., with $6,500,000 capital, by Howard Murray, William S. Hart, Julian C. Smith and others.

BRANTFORD, ONT.—The Dominion Steel Products Co. is having plans prepared for a manufacturing plant here. W. P. Kellett is manager.

CROWLAND, ONT.—E. J. Pratt, clerk, Welland, Ont., is receiving bids for extension to waterworks plant here to cost $12,000. George Ross is engineer.

GALT, ONT.—The Perfect Machine Co. will start building operations on an addition to cost $50,000.

HAMILTON, ONT.—A permit has been issued to the B. Greening Wire Co. to erect a 4-story addition to its plant, to cost $40,000.

LARDER LAKE, ONT.—The Associated Gold Fields Mining Co., Toronto, Ont, will build a 5000-ton mill.

LONDON, ONT.—The London & Port Stanley railway will make improvements and will make improvements and will require equipment for its system at London, Port Stanley and St. Thomas, Ont., to cost $300,000.

SARNIA, ONT.—The Holmes Foundry Co. will build an addition.

ST. CATHARINES, ONT.—W. P. Near is calling for bids for the construction of a sewage disposal plant here. J. Albert Pay is clerk.

TORONTO, ONT.—The Automatic Scale Co., Ltd., has been incorporated to manufacture scales, etc., with $40,000 capital, by William H. Male, room 39, 33 Richmond street west; Harworth Atkinson and others.

TORONTO, ONT.—S. McCord & Co., Ltd., have been incorporated to manufacture builders' supplies, machinery, etc., with $100,000 capital, by Samuel McCord, 696 Queen street east; George S. McCord and others.

TORONTO, ONT.—The Canadian Mine Shovel Co., Ltd., has been incorporated to manufacture tunnelling machinery, mechanical shovels, etc., with $100,000 capital, by Charles B. Jackes, room 202, Lumsden building, Horace M. Jackes and others.

New Trade Publications

MACHINE TOOLS.—Turret lathes, horizontal boring and drilling machines, vertical boring mills, universal tool grinders, etc., are described and illustrated in a 4-page circular recently published by the Gisholt Machine Co., Madison, Wis. General data pertaining to each machine are given.

BARGES.—The Dravo Contracting Co., Pittsburgh, has published a booklet in which a paper entitled "Barges for Interior Waterways," is given. This paper was read before the Mississippi-to-Atlantic Inland Waterways Convention at Pittsburgh, Jan., 1919, by F. R. Dravo, president of the company. The booklet is profusely illustrated.

OIL ENGINES.—The Allis-Chalmers Mfg. Co. has published bulletin No. 1532-A, in which oil engines of the diesel type are described and illustrated. The operation and construction of these engines are given in a thorough way and the numerous line drawings and illustrations give the reader a comprehensive idea of these engines.

COMBUSTION.—A booklet, entitled "Securing Better Combustion of Mid-West, Western and Southwestern Fuels," has been published by the Green Engineering Co., East Chicago, Ind. Many problems which arise in securing efficient combustion with fuels from the districts mentioned in the title, are discussed in the various articles appearing in the booklet, and which are reprints from *Power* and *Electrical World*.

CONDENSER EQUIPMENT.—A revised and enlarged bulletin entitled "Condensers, Pumps, Cooling Towers, etc.," has been published by the Wheeler Condenser & Engineering Co., Carteret, N. J. The bulletin illustrates and describes late developments in condenser practice. Illustrations and descriptions of surface condensers, jet condensers, barometric condensers, air pumps, centrifugal pumps, rotative dry vacuum pumps, turbo-air pumps, steam jet air pumps, natural and forced draft cooling towers, feed water heaters, evaporators and dryers are given.

STARTING SWITCH.—The Electric Controller & Mfg. Co., Cleveland, is circulating a 4-page leaflet in which a starting switch for small induction motors is described and illustrated. This switch is built to handle motors up to and including three horsepower, 110 volts, or 7½ horsepower, 220, 440 or 550 volts. Overload protection is supplied by two special alloy wires stretched along the left side of the slate. They open the circuit to the motor quickly if the overload is excessive and introduces a delay if the overload is only slight.

OPTICAL PYROMETER.—The Leeds & Northrup Co., Philadelphia, has issued a catalog in which an optical pyrometer for works temperature measurements, is described and illustrated. Its practical application in gaging temperatures in muffle furnaces, electric furnaces, in the open, in fuel beds, heat-treating furnaces, the rolling and forging of steel, blast furnaces, of molten steel and slag, molten cast iron, molten nonferrous metals, molten glass, in ceramic furnaces, etc., and for checking thermocouple pyrometers are given.

THE IRON TRADE REVIEW

Vol. LXV Cleveland, December 18, 1919 No. 25

Works Strive to Restore Output

Iron and Steel Producers Attack Problem of Overcoming Effects of Recent Interruptions—Shortage of Material in Many Lines Most Acute—Large Rail and Plate Sales—Pig Iron at $40

IRON and steel plant operations gradually are being restored to the point at which they suffered curtailment recently through the restrictions placed on fuel supplies. While the most alarming aspects of the situation of a week ago have been dissolved through the coal strike settlement and the relaxing of the federal regulations covering distribution, the recovery of production will require more time. It is believed it will be several weeks before the mills and furnaces again will be able to re-establish their former basis of operations. The loss of tonnage by the interruptions of the past two or three weeks has been considerable and it has come at a time when the industry, just emerging from the steel strike and facing a tremendous demand, could afford it least. The market effect of this continues to be seen in an acute shortage and in a further lifting of prices in various lines. Production more and more has become the dominating factor of the situation and makers are squaring themselves to attack this problem with great vigor once the holiday period is past.

Though all restrictions on coke production have been removed, government control of coke prices remains. Various steel companies, short of supplies, have been scouring the market for tonnage. A fair amount of coke business has been done at the fixed prices of $6 and $7 Connellsville base, including some by-product tonnage in the East.

Big Orders Placed

As a rule, producers are forced to sell sparingly because the prospects are against their having much free tonnage for many months. Some important buying however is going in certain of the heavier material where demand either has been lacking previously or has been moderate. The New York Central lines have distributed 150,000 tons of rails with different mills for 1920 delivery contingent upon the railroads being returned to their former owners. Western roads which buy in New York have closed for about as much tonnage on a similar basis. Other western lines with official headquarters in Chicago, have reserved 400,000 tons, which it is believed represents practically their entire requirements for next year. Four eastern roads are inquiring for a total of 132,000 tons. Ship steel is keeping in prominence. At Chicago, the leading interest the past week booked 75,000 tons for Pacific coast yards and the largest independent there, 25,000 tons. At Pittsburgh 65,000 tons of new inquiry has been bid upon. the navy is out for 14,000 tons for two cruisers. Eastern makers have sold plates in considerable tonnage at 3.00c Pittsburgh, and have asked 3.25c.

French Sell Billets

The export market has been featured by an unusual transaction in which a New York house has purchased 135,000 tons of 3¼ to 13-inch shell billets from the French government. This steel is to be converted into commercial forms for sale at home or abroad. The Steel corporation has closed for 15,000 to 18,000 tons of rails for the Dutch East Indies, winning this business against the competition of European mills. This is understandable in the case of British makers who have just raised their price on rails to the equivalent of $65.28.

Iron Reaches $40 Line

Following the touching of that figure at Chicago a week ago, the $40 price on pig iron has appeared in several districts. An eastern maker sold some second half No. 2 foundry at $40 furnace, and prompt and second half No. 2X from the same district has brought $40 and $41 furnace. Further sales have been made at Chicago at $40 and that figure now is accepted as the market there. For second quarter $40 Birmingham has been named. Valley and Buffalo makers continue to hold their schedules unchanged at $38 furnace for the base grade. Steelmaking grades also continue to advance. A St. Louis steel maker has bought 10,000 tons of basic from a local furnace. Shipments of iron have been considerably in excess of production. In November the furnaces dispatched 90,000 tons more than they made, drawing on stock piles to this amount.

Recuperation is Slow Process

PRODUCTION of iron and steel in the United States has just passed through the most discouraging three months in its history. Other periods where a stringent reduction of output has been forced by conditions outside the trade or market situation have been faced, such as attended the demoralized traffic conditions in the winter of 1917 and 1918. But these were the outcome of abnormal conditions beyond the control of either employer or employe. They therefore are not to be compared with the present period of curtailed operations which have been deliberately brought about by labor through invoking the country-wide strike weapon. Where in the former case the loss of output has represented an unavoidable result, in the latter it has been purely a man-made penalty which labor has inflicted upon industry and therefore the country at large because its dictation was resisted.

The actual loss of iron and steel production due to the steel and coal strikes, has been estimated at something like 2,500,000 to 3,000,000 tons. The probable accuracy of this estimate is indicated by the productive record of the country in pig iron during the past three months. As compared with August, the last month unaffected by strikes, the loss of output during September, October and November was about 1,600,000 tons. This figure has been added to greatly during December because of the banking of many stacks caused by the shutting off of fuel supplies. During August the pig iron output of the country, according to the statistics compiled by THE IRON TRADE REVIEW was 2,742,081 tons. The average production for the three months of September, October and November, was about 2,250,000 tons. These figures, however, do not measure the full loss caused by the strike. In August iron and steel production due to the expanding trade movement that then was in progress, was on the increase. Had the strike factor not interfered, September, October and November undoubtedly would have shown an extension of this increase of the productive rate. The potential loss of iron and steel accordingly was far beyond anything which the bare figures of output now disclose.

With the steel and coke strikes now matters of history, the iron and steel industry is squaring itself about for a period of vigorous recuperation, pressed on all sides by the tremendous demands for material. The factor of potential loss to the industry and to the whole country however is bound to be carried along for some months. It is one thing to call off a strike but another to restore operating efficiency after weeks of idleness and scattered forces. It promises to be several months before it can be hoped to re-establish high speed production and then only in the event no further restrictive factors develop. This only goes to prove how costly a general strike is. And of the three sufferers, the country at large, the employer and the employe, the loss of none is greater proportionately than of the wage-earners themselves.

Profit Sharing Aids Production

PANACEAS for labor difficulties are as numerous as they are varied. Labor's universal and sustained cry is one for shorter hours and longer wages; with these prescriptions labor hopes to cure all industrial ills. It sees but the need for more money to meet the high and apparently ever-increasing cost of living. Not enough consideration is being given to another diagnosis; a diagnosis made by the careful thinker, be he employer or employe, namely, the need for increased production.

Industrial doctors fast are coming to the realization that the labor situation today hinges not so much upon the underpaid workman as it does upon the under-production of that workman. Counter-complaints by employers that employes are producing far below par are as numerous if not more so as complaints by employes that wages are low and hours are long. Machinists and machine workers

as well as other classes of labor are said to be producing in some cases as low as 25 per cent of their possible capacity.

How to bring about increased production is engaging the attention of a widening circle of industrial leaders. That they cannot bring it about by addresses to workmen has been proven; neither can they bring it about by newspaper or any other sort of propaganda.

Increasing attention therefore is being given at this time to the possibilities of profit-sharing in stimulating production. But all consideration of this method of compensation must recognize the fundamental fact that to be successful, the workmen's share must represent economic benefits created by his labor and it defeats its own purpose where it ceases to be based on tangible returns and becomes a mere gratuity. Successful profit-sharing cannot be expected, moreover, unless accompanied by a campaign of education. Employers must be educated as well as employes. No plan of profit distribution can be successful if one-sided. Lean years are possibilities and employes who are beneficiaries under a profit-sharing plan, when the figures show a loss instead of a profit, should expect to share in some of these losses.

If these conditions are established profit-sharing is certain to have a beneficial effect; it will serve to weed out the undesirables, the disturbers and the transients, who do not intend to become citizens or home-owners but who simply aim to get as much as they can, raise disturbances and then clear out.

It is becoming apparent that something must be done to bring about an increased production in practically every line of industrial activity which immediately or remotely affects the lives of the people. That properly administered profit-sharing is effective is shown by the production records of shops which have tried it out.

Lead Shortage is World-Wide

ADVANCING lead prices reflect the world shortage of this metal, which has been especially affected by labor troubles the world over. In May, lead sold at 5.00c a pound, as against 8.05c, the price prevailing when government control ended last December. Today the market is 7.00c to 7.25c, New York delivery, an advance of over 40 per cent. The United States, Spain, Australia and Mexico are the leading lead producing countries and supplies from all these countries will show curtailment this year. Strikes at certain smelters and in the Coeur d'Alene district in Idaho, together with decreased operations because of fuel shortage, will cause a reduction of 10 to 20 per cent in the production of domestic lead in the United States in 1919 as compared with 1918. The Utopian scheme of labor and capital relations in Australia has been sufficiently disturbed this year that supplies of lead from this quarter will be sharply cut, the bitter struggle beween employers and employes in Spain will cause a loss of Spanish lead of about 50,000 tons as compared with normal; while in Mexico, political and economic conditions have continued to interfere with mine operations and shipments, so that supplies from this quarter again will be far below normal. The world shortage of lead has been reflected in a strong London market, with advances of more than £2 per ton in two weeks. The London prices have been sufficiently high to threaten to attract sales of domestic lead instead of foreign lead smelted in bond, which is normally much cheaper. Consequently domestic producers have steadily been forced to advance their prices to keep domestic lead at home and avert a serious shortage here.

The Pot Calls the Kettle Black

TRADE union leaders called into conference last week in Washington by President Gompers made a puerile attempt to court public approval by indulging in the popular pastime of denouncing bolshevists. The bid for applause might have carried some weight had the leaders promptly put into practice what they preached and ejected those radicals within their ranks who are well recognized as being opponents of law and order and Americanism. Without such evidence of good faith, mere lip service to popular ideals savors of hypocrisy. Fitzpatrick presiding and Foster applauding the repudiation of radicalism suggests the pot calling the kettle black.

In the United States today there are only two classes who are persistently criticising the federal courts, the officials of the American Federation of Labor and the out-and-out bolshevists, as the enemies of the government are understood by the American public. At the same conference in which it denounced bolshevism, the federation fired a broadside of excoriation at the courts, the country's bulwark against bolshevism.

The two statements from the leaders of the trade unions are inconsistent, and makes it even more difficult for their friends to apologize for them. A far more effective course from the standpoint of their own interests would have been for the federation to have asserted itself in favor of obedience to the law, and to have given some proof of its opposition to radicalism by the ousting of Foster. Constituted as it is, it could do neither; but it sought to throw dust in the eyes of the public and make a pretense of purging itself by adopting a declaration against bolshevism.

$40 Iron Appears Here and There

Eastern Makers Sell at $40 Furnace for No. 2 and $41 Base on No. 2X—Southern No. 2 for Second Quarter Quoted at $40—Buffalo and Valley Iron Held at $38 Base — Demand is Heavy

Pittsburgh, Dec. 16.—Several good sized tonnages of foundry iron for first half of 1920 shipment have been moved at $38, valley and western Pennsylvania furnaces for No. 2 foundry (1.75 to 2.25 silicon) in the past few days, a clear advance of $2 a ton over the basis of the last previous sales, and furnace interests serving this district now say they have no more of this grade for less than $40, furnace. The usual differential of $1.25 per ton has been obtained on two good-sized sales, also for first half delivery of foundry iron running 2.25 to 2.75 in silicon. A further advance of $1 a ton also has been established on standard bessemer, a sale of 1000 tons being noted at $35.50, valley furnace, while several quotation-making tonnages lately were disposed of at $36. A portion of the latter business was with foundries and the iron is for western shipment and is to be substituted for foundry grade. Although it is reported that 7000 tons of standard basic have been sold by a valley interest for first half shipment at $35, verification is lacking and in the absence of syndicated sales at a higher price the market remains at $34, furnace, although this grade is scarcer than bessemer and makers who remain in the market generally are asking $35, furnace. Bessemer is doing best in price of the two grades of steelmaking iron because of its adaptability to either foundry or steelmaking use. No recent business has been done in gray forge or malleable, although a good sized sale of the latter is said to be pending at $38.25, valley, for first half. All grades of iron for early delivery are being sold in small lots, at least $1 a ton above the basis of round tonnages. Several lots of bessemer running from a carload to 500 tons having been moved at $37, furnace. Trading is unattended by the excitement of a few weeks ago, but with the supply situation one of marked strength, it does not require much activity to advance prices. It is reported that merchant production of pig iron last month ran 96,000 tons behind the shipments, indicating a reduction in furnace yard stocks of that amount.

Spot Demand is Less

Boston, Dec. 15.—With the end of the year close at hand the demand for spot pig iron in New England has dropped to meager proportions. Although foundries are exceptionally busy and in many cases behind on orders, there is a strong desire not to take on any further supplies which would increase the 1919 inventory. A final settling of the coal strike has had a moral effect in relieving abnormal conditions and while there is a strong permanent demand for 1920 iron the panicky features of the market have disappeared entirely. Sales in New England during the week have established fairly consistent markets in all of the districts except Buffalo. The base price for Alabama iron may be said to be $36, furnace, for New England delivery. In Virginia while available supplies have noticeably tightened, nearly all the iron now offered is on a $38, furnace base. The Virginia Iron Coal & Coke Co. has sent out a list of small lots of special manganese iron which it is offering at prices figured on the $38 base. Eastern Pennsylvania iron for first half is also being sold at $38, furnace, for 1.75 to 2.25 silicon. The Temple furnace at Temple, Pa., came into the market during the week and quickly sold up its desired tonnage at close to $38, furnace. During the latter part of the week a tendency in some cases toward high Pennsylvania prices, was shown and sales at $40 at the furnace for 2.25 to 2.75 silicon were reported.

One such sale was for 500 tons to a Massachusetts consumer for second quarter. A feature of the present market is the fact that occasional sales are being made extending through to the third and fourth quarter. These have usually been in connection with first half contracts and are not part of any established policy to open books for second half. Some sales extending through second half have been made at $40, furnace, for 2X eastern iron (2.25 to 2.75 silicon). One furnace has made several sales in this territory based on a Buffalo market of $39.25 for 2X iron (2.25 to 2.75 silicon) for first quarter.

Much Off-Iron is Sold

New York, Dec. 15.—Large tonnages of off-iron which recently came on the market in this and other districts, now have been pretty well absorbed. This iron was offered principally from furnaces owned by steel companies, and the tonnage disposed of amounted to 20,000 to 25,000 tons, and probably considerably more, for this and other districts. The prices obtained were several dollars per ton below the market on standard iron. Sales of standard iron in this district during the past week were small as compared with preceding weeks. This was due to the fact that most sellers are unwilling to accept any more tonnage, and in fact, are taking only what is being forced on them by

regular customers. One eastern Pennsylvania maker during the past week has taken a little foundry business of this insistent kind at $41, furnace, for 1.75 to 2.25 silicon, and $42, for 2.25 to 2.75 silicon. Another eastern Pennsylvania furnace has taken some 2.25 to 2.75 silicon, for first half, at $41.25, furnace, with $1 higher for first-quarter alone. Another eastern Pennsylvania interest made its last sale nearly a week ago at $41, furnace, for 2.25 to 2.75 silicon, and has named no price since. Central Pennsylvania foundry iron still can be had at $40, furnace, for 2.25 to 2.75 silicon. Buffalo iron is almost impossible to obtain. In fact, Buffalo makers, in all cases as far as known, have free not more than one month's output over the first half. A Virginia interest which a week ago was taking some business from regular customers at $38.50, furnace, for 2.25 to 2.75 silicon, and $40 for 2.75 to 3.25, has not changed its prices, but is practically out of the market. A little Alabama iron has been sold in this district during the past week at $36, Birmingham, for 1.75 to 2.25 silicon. Some basic has been sold in this district at $36, eastern Pennsylvania furnace. Sales of malleable have been made at $38, eastern Pennsylvania furnace. There is a fair amount of export inquiry here. This includes principally basic, and also some foundry for Japan. 1000 tons of foundry for Brazil, etc. One northern furnace, having partly covered its coke requirements for the second half, has booked some second-half foundry business from regular customers on a basis of $40, furnace, for No. 2.

Consumers Not Suffering

Philadelphia, Dec. 16.—While pig iron scarcity continues, the extent to which consumers are able to get spot iron from regular sources is surprising. No case is known where consumers are embarrassed in their operations through lack of iron. While comparatively few furnaces are soliciting business, sales form a large aggregate principally for forwarded delivery. Considerable spot off-iron is included in current business, also considerable spot standard grades. While a number of the furnaces have not yet sold all their first quarter output, some are booked for the entire first half and in one case a furnace is said to have enough tonnage for 10 months. Prices of Virginia iron are going up rapidly. Several thousand tons of Virginia were sold at $38, furnace, for No. 2 plain (1.75 to 2.25 silicon), and $39.25 for No. 2X (2.25 to 2.75 silicon). Some spot Virginia iron still is obtainable at these figures, but these prices have been withdrawn for next year, for which $20 higher is being asked. Market tendencies are being reflected by the fact that Virginia No. 1X (2.75 to 3.25 silicon) has been sold at $42, furnace. Considerable Virginia high silicon and high manganese is being sold for spot shipment with differentials. In eastern Pennsylvania No. 2X is bringing $40 and $41, furnace, although there are some sales at $42 and some are reported even higher. Central Pennsylvania has been sold in round lots at $42.80, delivered Philadelphia for No. 2X. Buffalo No. 2X has been sold here for first half at $43.15, delivered Philadelphia. Southern iron in round tonnages has been sold for northern shipment for first half at $37, Birmingham, for 2.25 to 2.75 silicon. No basic has been sold but $35, furnace, is said by makers to be a low figure. Malleable has been sold for spot shipment at $38, eastern Pennsylvania furnace, and for first half at $39. No new sales of standard low phosphorus are reported and this grade continues at $45, eastern furnace. Copper-bearing low-phosphorus iron makers have sold round tonnages for first half at $40, furnace, and on new inquiries have asked $43, Eastern blast furnaces are not much worried by decision of the railroad administration to spot cars only to take on fuel, limestone and ganister since they are well provided with iron ore for the winter. The Alan Wood Iron & Steel Co. expects to blow in its new 600-ton furnace on basic as soon as assured of fuel.

Iron for First Half Scarce

Buffalo, Dec. 16.—It is becoming more difficult to obtain pig iron in this territory for 1920. Only foundry grades can be obtained, and the capacity of first half iron left to district furnaces is growing small. No first quarter iron is available, furnacemen say, except such limited tonnages as they may allow their established trade. During the past week one furnace interest contracted for between 5000 and 10,000 tons of foundry iron. Out of a battery of four furnaces, three are now working on foundry iron. The fourth is being relined, but when this is finished the furnace which ordinarily makes malleable iron will be held available to make foundry iron already sold by this interest for prompt shipment. Third quarter iron is not figuring in the market. Inquiry for foundry iron is strong for small tonnages. One furnaceman states that there is an almost unlimited demand for 300 to 500-ton lots. No changes have been made in prices. Reports that a tonnage of No. 2X foundry (2.25 to 2.75 silicon) was sold here for $40, delivered, Philadelphia, cannot be verified.

Little Iron is Offered

Cleveland, Dec. 16.—A few sales of iron are being made in this territory because supplies continue exceedingly scarce. Wherever any transactions are put through, however, they show a still further advancing movement of prices. Local furnaces continue out of the market and it is uncertain when they will resume selling, as their present obligations will depend entirely upon whether they are able to increase production. A valley interest has sold several thousand tons of foundry iron for first half on the basis of $38 for 1.75 to 2.25 silicon and $39.25 for 2.25 to 2.75 silicon. Included in these sales was one lot of 3000 tons. This same interest has sold malleable at $39.25, valley. Inquiry continues active but this in large part is going begging or is attracting little attention from sellers because they have not the iron to offer. The American Car & Foundry Co. has recently been figuring on 3500 tons of foundry and malleable for delivery at Detroit for first half. A southern Ohio steelmaker inquired during the week for 1000 to 2000 tons of prompt basic but it is believed that this is only a forerunner of a larger tonnage that is wanted. With more assured operations, because of the elimination of the coal strike, shipments are expected to go forward more freely. Unless makers are able to increase present production by blowing in additional stacks, however, they are not likely to have much additional iron for sale for a long time, so heavy are their present obligations.

Delivery Most Important

Chicago, Dec. 16.—Getting pig iron from producing stack to the consumer is the most important and difficult feature of the pig iron situation at present. Orders to railroads limit the use of open top or gondola cars to the coal trade entirely and blast furnaces are not able to obtain a supply for shipping their product. This situation began to be felt today and probably will be much worse before it grows better. Furnaces casting pigs in chills are equipped to load the iron direct into open cars and have no facilities for transferring it to box or cattle cars, which is the only kind available at present. Lack of men to handle the iron prevents its being loaded into the less desirable cars. The only alternative is to pile the iron in storage yards, and this is a difficult matter in the present labor situation. Furnace operation is far from good as coke is more or less irregular because of interrupted coal supply and much off iron results. While price is not a factor in the present market, as ability to get the iron weighs much more heavily, it may be stated that northern iron is quotable at $40 furnace, for silicon 1.75 to 2.25. Comparatively little tonnage is being contracted and then only in the most extreme cases. No large inquiry is being entertained for foundry iron, as most melters apparently believe they would be unable to obtain material at present. Melters of malleable iron are seeking considerable tonnages, inquiries for 1500 tons, 1000 tons and 2000 tons being representative, a total of 7000 to 8000 tons being asked from one local seller. This demand is being filled with malleable from the valleys at $38, furnace, subject to $3.80 freight to Chicago. A recent sale of 1000 ton of malleable wa made at $37, valley, for first half. Demand for silveries lags and comparatively little is being asked. A Jackson county interest is asking $50. and a Tennessee maker $50.25 for eight per cent at the furnace. Makers of pig iron believe the tightest pinch for material will come in January when bad weather is likely to interrupt transportation of coal and intensify the operating situation. Some makers believe furnace operation will be interrupted and are certain that it will not be possible to ship iron as rapidly as it may be turned out. Fuel difficulties are expected to follow exhaustion of present reserves of coking coal, which will not be replaced as rapidly as they are used.

Quote $40 on Southern

Cincinnati, Dec. 16.—Demand for

pig iron in this district is very strong but very few furnaces are quoting. On a lot of 1000 tons of southern No. 2 (1.75 to 2.25 silicon) for second quarter delivery, $40, Birmingham, was named. It is believed that this price represents the minimum figure which southern furnaces would take business for first half. The furnaces are well filled with orders.

Strong Demand at St. Louis

St. Louis, Dec. 13.—Demand for pig iron from all sources is strong. Supplies for December delivery are exhausted, and available tonnages for the first half of 1920 are growing scarcer. Larger users are fairly well provided for the balance of this year and the first quarter, but not more than one-half of what will be needed during the second half of 1920 has been contracted for. Numerous smaller interests are hard pressed for iron for immediate needs. Prices are strong and advancing. Most of the merchant furnaces supplying this district have withdrawn. All consumers having iron under contract are urging prompt deliveries. Sales for spot shipment have been confined to a few scattering cars, and offers of premiums have failed to secure more. A good business in futures is reported, covering virtually all grades, but the furnace interests are not eager to dispose of future production even at stiff advances.

Sales for the week range from 200 to 1000 tons of foundry grades. The Scullin Steel Co. has purchased 10,000 tons of basic from the Mississippi Valley Iron Co. The latter's furnaces have been idle for several months for repairs and enlargement, and will not be blown in until March 1, so that the shipments will not start before that date. This 10,000 is part of an inquiry for 25,000 tons, the remainder of which is still open. No figures were given in the announcement of the transaction, but the Mississippi valley is quoting $38.50 to $42 for 2.25 to 2.75 silicon. No. 2 southern (1.75 to 2.25 silicon) ranges from $35 to $36. One sale of 700 tons of 3.75 to 4.25 silicon was reported by an eastern Ohio interest at $44, furnace. For this same grade a Missouri furnace is asking $48.

Southern Furnaces Out of Market

Birmingham, Ala., Dec. 16.—Producers of pig iron are out of the market at present, the only business transacted being with home melters or old customers. Quotations are on a basis of $35 for No. 2 foundry (1.75 to 2.25 silicon), and $36 is reported. Predictions are being made freely that by Jan. 15 the price of iron will have advanced $5 per ton over present figures. Costs of production in this district are expected to go up in the next few days. Consumers continue asking for delivery on old contracts, and railroads are endeavoring to furnish cars with which to move the product. Efforts are now being made to get furnaces in shape for operation, and in the next few days one stack will be blown in and two others will be ready for lighting.

No effort is necessary to sell charcoal iron. The market is very strong and this grade is quoted at $50 f.o.b. furnace.

Coke Prices Held Down

Brakes Applied by Fuel Administration as Spot Supplies Fall Far Behind Demand—Lifting of Coal Restrictions Has Not Yet Brought Relief

Pittsburgh, Dec. 16.—Spot supplies of coke still are so much behind the demand that if the fuel administration had not put the brakes on prices, the chances are that the market would be up around the highest levels of the war period. Ending of the coal miners' strike and the lifting of the restrictions on the allotment of coal for beehive ovens have not yet brought about any relief for the steel manufacturers operating by-product coke plants and such companies as the Midvale Steel & Ordnance Co., the Bethlehem Steel Corp., the Lackawanna Steel Co., the Republic Iron & Steel Co., the Youngstown Sheet & Tube Co., and the Jones & Laughlin Steel Co., still are combing the market for spot or prompt tonnages to tide them over until their coal shipments are sufficient to allow of the operation of their own by-product plants. It is intimated they would take 72-hour or foundry grade of coke and pay the premium of $1 per ton this grade commands over furnace grade in order to get supplies. Decline in the Connellsville production last week as a result of the fuel administration restrictions on the use of coal, it is estimated, averaged about 30 per cent from that for the week ended Dec. 6. It is doubtful if the operators and the trade in general ever before had such an experience like that of last week. Much confusion existed as the extent of the curtailment that was to be made, for the reason that the order was executed under the direction of the railroad administration and the orders sent out from the regional directors varied considerably. The Baltimore & Ohio railroad and the Pennsylvania railroad, which are under the jurisdiction of the Allegheny regional director had one set of instructions, while the Pittsburgh & Lake Erie railroad, the Monongahela railroad and the Pittsburgh & West Virginia railroad under the eastern regional director had another. The first order was for a 25 per cent cut, but almost before this was effective came a supplementary order calling for another cut of 25 per cent. After many conflicting orders as to methods to be employed in bringing about the reduction, it finally was decided that no cars were to be spotted for loading coke on Thursdays and that on the other five days of the week, the operators were to charge only a sufficient number of ovens to permit of 60 per cent of the production of the week ended Dec. 6. All restrictions on output were removed last Saturday. This week finds the car supply only 70 per cent, due to the fact that so many loaded cars are on track at or near consuming points. Oven operations are on a scale sufficient merely to allow operators to take care of contracts, against which buyers are specifying 100 per cent. Connellsville production of coke for the week ended Dec. 6, is estimated by *The Connellsville Courier* to have been 262,810 tons, as compared with 237,455 tons in the previous week. Assuming last week's production to have been 70 per cent of that for the week ended Dec. 6, the output of the regions was about 184,000 tons.

New England Demand Eases Off

Boston, Dec. 15.—With the coal strike ended, a decided slump has occurred in the coke market. There is no demand for spot coke, partly because of the desire to hold down stocks at this time of the year, and partly because foundries ordered in excess of requirements during the time of uncertain deliveries. First half contracts for the larger consumers have nearly all been entered. Little new business is expected until the middle of January. With the price of by-product coke at $11.90 or 50 cents a ton more than the price for beehive coke, based on $7, Connellsville, greater interest is being taken in the Pennsylvania product.

By-Product Furnace Coke Sold

New York, Dec. 15.—Eastern by-product coke has been sold during the past week for blast furnace use, this being the first business of its kind in a long time. The seller was the northern New Jersey producer and the government price of $8.69 f.o.b. ovens at Seaboard, N. J., or $5.59, Connellsville, prevailed. The coke involved is for both this and next year to eastern furnaces, and at least two good sized contracts were included. The northern New Jersey by-product maker is not selling any more foundry coke for shipment this year, but it is booking for 1920. Its price is $7.50, Connellsville, for delivery in this district, and $8, Connellsville, for shipment to New England. The price of $7.50, Connellsville, to New Jersey consumers, is equivalent to $10.60, delivered at Newark and other northern New Jersey points. On this basis, its price figures out somewhat less in most cases than the government maximum, which is $9.69, ovens, Seaboard.

Production Returning to Normal

Birmingham, Ala., Dec. 16.—Coke production this week will be normal. Government restrictions on coal were removed last week and beehive oven operators are not required now to give 50 per cent of their coal to the open market. Demand for coke is strong and quotations are firm. Foundry coke is quoted at $9.50 and furnace coke above $7.50. The Sloss-Sheffield Steel & Iron Co.'s 120 Semet-Solvay by-product ovens will be in operation by Feb. 1 and the Birmingham By-Product & Coke Co.'s 30 Kopper ovens will be producing by Feb. 20. But little coke is being shipped at present from this district. Coal production is normal.

Buying Scrap For Export

Europe Takes Axles and Japan, Heavy Steel and Other Grades—Market Holds Its Strength Well—More Advances Noted

FOR COMPLETE SCRAP PRICES SEE PAGE 1682

New York, Dec. 15.—A heavy export demand for steel car axles features the local scrap market. The axles are being bought for shipment to southern Europe. Due to the volume of this business prices have advanced rapidly, the market being $34, f.o.b. New York. Substantial lots of heavy melting steel and related grades have also been going abroad, Japan being the heaviest buyer. England steadily is taking some tonnage of choice grades, such as low phosphorus scrap. China has been taking fair tonnages of clippings, horseshoe scrap, etc. However, this demand is slower, and at the moment there is a round tonnage of horseshoes being offered for export without takers. While the domestic market appears to be undergoing a seasonable lull, the scarcity of pig iron is resulting in a large demand for cast scrap. Prices within the past few days have advanced to $26 to $27, f.o.b. New York, for heavy cast and $28 to $29 for machinery cast. Other descriptions to advance are machine shop turnings and old steel shafting, quoted at $27 to $28. The freight rate from New York to the Pittsburgh district has been advanced 10 cents, the rate now being $4.10.

Some Grades Are Easier

Philadelphia, Dec. 16.—Turnings have become weaker and consumers now are bidding only $18, delivered. Sales have been made at this figure. Heavy melting steel is easier on developments of the week although this is due to the withdrawal of buying. The Pencoyd Iron Works of the American Bridge Co. now is out of the market. An inquiry by big steel companies probably would send the market right back again. Chemical borings and turnings, forge and bundled sheets are stronger as are also rerolling rails, shafting, car wheels and iron and steel axles.

Mills' Suspension Affects Market

Boston, Dec. 15.—The coal shortage caused several steel mills in Pennsylvania to shut down or greatly curtail their production and the result has been a drop in the demand for some grades of scrap. Turnings have been particularly affected, for one Lebanon, Pa., rolling mill which has furnished a good, steady market for the best of this grade of scrap, is among those to shut down. The prices of turnings have dropped about $1 in the local market. New England foundries are behind on orders and cast scrap holds firm. No. 1 machinery has sold as high as $36 to consumers, and sales of round tonnages at $35 have been reported. Worcester, Mass. foundries have been among those particularly active in the scrap market. Heavy cast scrap has advanced to $32, delivered to consumer, and is in great demand. Borings, although inactive have not dropped in price. A sale of 400 tons of borings for chemical purpose is reported at $21 f.o.b. cars' shipping point. On a lot of 100 tons of steel armor plate for sale by the district ordnance office, the Midvale Steel & Ordnance Co. bid $30 per gross ton, f.o.b. Fitchburg, Mass. Other bids at this office include one for 125 tons of round steel bars by the Garden City Plating & Manufacturing Co. at $42.50 per net ton, f.o.b. South Boston, and further offerings include 80 tons of steel blooms and 185 tons of 2⅞-inch round cold-rolled steel.

Still a Waiting Proposition

Pittsburgh, Dec. 16.—In the lack of any material increase in steel plant operations as a result of the settlement of the coal strike, demands for the open-hearth grades of scrap still are on a limited scale but this fact has not been productive of any weakening in prices, for dealers confidently expect a more active and higher market with the turn of the year and are disinclined to sacrifice their holdings. While steel manufacturers are able to pick up small tonnages of heavy melting steel from time to time at $24 to $24.50, no round lots are available at these prices and it is doubtful if dealers would consider even $25 on contracts. Not only do the indications point to a more active market after the turn of the year but the firm attitude of the dealers with regard to steel works grades finds support in the unusually wide spread between the price of heavy melting steel and basic pig iron. Ordinarily the margin is a matter of a few dollars while today it amounts to almost $10 a ton. Foundry grades of scrap remain in good demand and such lots as are coming upon the market are being promptly cleaned up at firm prices.

Suspend Scrap Shipments

Buffalo, Dec. 16.—Although the coal strike has been settled, consumers are asking that scrap shipment be temporarily suspended until they learn what their coal supplies will be. In the meantime mills are checking up on stock lists. All district mills are in the market with one exception, and this mill is expected to enter the market soon. Heavy melting steel is in great demand. Almost unlimited tonnages of this grade can be sold at $23.50. Large sales of heavy melting steel, turnings and borings were made during the past week.

Upward Tendency Resumed

Cleveland, Dec. 16.—Prices of scrap iron and steel have recovered from their weakness and the tendency now is upward. The fuel situation, and now the inability of dealers to get open cars, have cut into scrap trading, but almost every dealer is unwilling to sell except at several dollars above present levels. Some heavy melting steel brought $21.25 today at producers' works, Cleveland. A plant is reported to have sold its December output of compressed sheet scrap at $20. Whenever 1920 prices are mentioned they are far above today's prices, and some dealers go so far as to predict $30 melting steel within six months. Quotations on heavy melting steel, bundled sheet scrap, old steel rails for melting, machine shop turnings, blast furnace turnings, stove plate, grate bars, malleable, No. 1 busheling, rerolling rails and car wheels have been advanced.

Chicago Market Strong

Chicago, Dec. 16.—Iron and steel scrap is fundamentally strong in the Chicago market with cast grades especially in demand. There seems to be a shortage of this material in the face of heavy demand from foundries, which are seeking to increase their proportion of scrap in view of the shortage of pig iron. Foundries in outside centers are able to bid higher for supplies in their own towns than dealers in Chicago can pay and this has reduced the tonnage coming from outside sources. Some buying of busheling during the past few days has given that material a little boost, while most rolling mill grades have been weak. A feature of the present situation of much interest to sellers and consumers of scrap is the recent order directing that all gondolas be used only for the transportation of coal during the next two weeks. This is expected to shorten the car supply for heavy scrap, as it will be necessary to use box cars largely, which increases the cost of loading and unloading. The Southern has issued a list offering 1900 tons of scrap, the Santa Fe 1530 tons, the Northern Pacific 750 tons, the Monon 570 tons and the Chicago Great Western 350 tons.

Foundry Scrap Heads Market

Cincinnati, Dec. 15.—Foundry scrap continues strong and prices show an advancing tendency. There has been some good buying of No. 1 cast with heavy inquiries still pending. Steel mill scrap is quotably higher, but the market is not firm. There has been a noticeable falling off in demand due to the fact that many mills have been forced to close completely on account of coal scarcity. There has been an accumulation of yard stocks.

St. Louis Prices Advanced

St. Louis, Dec. 13.—Considerable uncertainty as to the future of the scrap market exists among consumers, but dealers believe prices will advance still further. This opinion is based on settlement of the coal strike and a great demand for finished and semi-finished materials. Heavy melting and shoveling steel, railroad wrought, cast and stove plate have been advanced. Scarcity and expensiveness of pig iron is a strong argument in favor of higher values. Most of the foundries were able to continue work while the coal strike was in effect, but those

which closed or slowed down are making arrangements to resume. Cast and foundry grades are urgently wanted, and are scarce. There is also an excellent demand for steel. Within the past month two local dealers sold 10,000 tons of heavy melting, and 10,000 tons of shoveling at $19 and $10, respectively. Little of this material has been covered on, it is understood, and now heavy melting is quoted at $22.50 to $23 and shoveling at $21.50 to $22. Offerings from all sources are light. The 2300 tons offered by the Wabash railroad last week brought highest prices, and the same was true of the smaller lists put out by the Missouri, Kansas & Texas and the St. Louis Terminal Railway association. Rerolling rails are strong and scarce. Rolling mill grades are fairly plentiful, but in good demand and steady.

Southern Market Firm

Birmingham, Ala., Dec. 16.—Several grades of scrap are in demand and this has served to strengthen the southern market. Representatives of dealers in the larger scrap centers recently visited this district and it is understood more material will be shipped to some of these centers. Dealers here are unable to supply all demands for cast scrap as promptly as desired.. Heavy melting steel consumers are not purchasing entirely through dealers. Some plants are using scrap again to offset cost of pig iron. Quotations for scrap iron and steel were not advanced during the past week.

Sheet Outlook Better

Coal Settlement is Helping Operations—Scarcity of Material is Extreme—Sales at $9 to $13 Advance

Pittsburgh, Dec. 15.—Settlement of the coal miners' strike, although not reflected as yet in any very general resumption of sheet plants, recently closed down because of the fuel shortage, has made the outlook for larger mill operations immeasurably better than a week ago. Several of the manufacturers are located close to coal mines and in some instances own them, and the return of the coal miners to work relieves the situation at these mills. The American Sheet & Tin Plate Co. which had only 72 per cent of its sheet mills in operation a week ago, expects before this week is out to materially increase its active capacity, and some of the independent companies in the Wheeling-Steubenville district already have resumed operations after a shut-down, due to the lack of fuel. No let-up is noted in the demand for sheets and sales at substantially more than the base prices readily could be made if makers were disposed to accept the bids being made by buyers. So little tonnage is in stock, however, and with old orders further backed up by the recent loss of production, new demands even from regular customers are not getting much attention. Some of the independent companies in the recent past have taken some business in galvanized as high as 6.50c, base, in blue annealed at 4.00c, base, and in black at 5.00c, base.

Eastern Makers Advance Price

Philadelphia, Dec. 16.—The leading eastern maker of blue annealed sheets has advanced its base price to 4.05c, Pittsburgh, for No. 10. An eastern plate maker who has been rolling sheet gages now has a minimum of 4.00c, Pittsburgh. No. 10 blue annealed sheet demand is greater than the mills can take. Western makers are not taking business here.

Not Even Wasters Available

Youngstown, O., Dec. 16.—While sheet production has been slowed down here by the coal shortage still this has had little to do in the way of tightening up on available tonnages. A sheet shortage prevailed here long before the fuel scarcity was felt. The situation now has reached a point where not even wasters are to be had. Every sheetmaker in this district either is booked until the end of March or on account of the uncertain conditions, does not care to entertain further business. This has had a tendency to create a strong demand for all grades and has pushed prices to a point where the market is difficult to define. A few hundred tons of black resale sheets changed hands recently at between 6.00c and 8.00c. Buyers without question will pay most any price in order to get shipments, so that the market today, as far as valley mills are concerned, is nominal. Future extension at the DeForest plant of the Republic Iron & Steel Co., Niles, O., will include eight modern sheet mills, which it is expected, will roll as much tonnage as now obtained from the 10 mills. Present plans call for an early start on the new addition.

Rail Tonnage is Divided

New York, Dec. 16.—The New York Central railroad has allocated among various mills 150,000 tons of rails for 1920 delivery, conditional on the return of the road to its owners. Western railroads with offices in New York have placed approximately the same tonnage on the same condition.

Eastern Roads Seek 192,000 Tons

Philadelphia, Dec. 16.—Owing to a lack of assurance when the railroads will be returned to their owners, all plans for rail purchases in this district have been temporarily halted. The Reading railroad is inquiring for 25,000 tons of rails, including 12,000 for the Central Railroad of New Jersey. The Baltimore & Ohio is inquiring for 65,000 tons, the Virginian 16,000 and the Norfolk & Western 26,000. Unless the roads are returned the recent distribution of orders by the Pennsylvania railroad will be canceled. It is not known what the administration plans are for purchasing rails in case the roads are not returned.

Railroads Are Willing

Pittsburgh, Dec. 16.—Track material of all sorts still is in moderate demand, although several of the larger railroads of the country are understood to be anxious to get a place on the books of the makers of standard rails for their probable requirements upon their return to private management. Belief that the railroads will go back to old management on Jan. 1 is not so confidently held as was the case recently. Few demands are coming out for standard spikes and small ones are not being quoted for quite so freely probably because of the interruption to coal mining and development work by the miners' strike.

Rail Tonnage Nearly Covered

Chicago, Dec. 16.—Contracting for standard steel rails by western railroads has been practically completed, with about 400,000 tons involved. A survey of the field indicates that this covers practically the entire needs of western railroads during 1920, except for small emergency lots. These contracts are completed with the exception of final signature, which awaits the return of the roads to their owners. Carbuilding is slack and practically no inquiry for this department is now current. South African railways have inquired for 100 steel underframes and 100 sets of trucks, which will involve about 1800 tons of plates, shapes and bars, but no axles.

What is claimed to be the largest drydock in the world was dedicated at the Puget sound navy yard, Bremerton, Wash., Dec. 16.

Strip Bookings Heavy

Pittsburgh, Dec. 16.—Makers of strip steel, both hot and cold rolled, are committed practically through the first quarter of 1920,, and while there have been no announcements of withdrawals from the market for this period, it is doubtful if any of the manufacturers in this district can take on any additional tonnage. No orders for delivery beyond the first quarter are being taken and most makers are allotting tonnages for that period, allowing buyers to enter only the same tonnages as were placed for the present quarter. Demand for hot-rolled steel is especially heavy, due to the fact that some makers of cold-rolled strip steel buy hot rolled for cold rolling. Base prices of 3.50c, Pittsburgh, for hot-rolled, and 6.00c for cold rolled steel are being generally observed by makers.

Bar Market is Strong

Leading Makers of Soft Steel Product Sold Up Three to Six Months—More 3.50c Orders Taken—Bar Iron Again Rises

Chicago, Dec. 16.—Bar mills, those producing soft steel, hard steel and bar iron, practically all are out of the market, some being sold through for entire first half and others having up to three months' business on their books. The situation is tightest in soft steel, the leading independent having nothing to offer until the middle of 1920, while the largest interest practically is in the same situation. All mills producing bar iron and hard steel bars are idle at present, lacking coal, and probably cannot resume until the final week in December or the first week in January. Considerable inquiry is being entertained for each of these products, but even when specifications accompany the inquiry, makers are unable to entertain them. In the absence of trading, prices mean little, but nothing has been quoted on soft steel bars higher than 2.62c, Chicago mill.

On bar iron an unusually large inquiry is coming out and considerable tonnage is being booked. There is every appearance that iron mills are coming into their own and may enjoy a normal business after 18 months of starvation. The minimum quotation is 2.87c, Chicago mill.

Want No New Business

Philadelphia, Dec. 16.—Leading makers are booked to such an extent that orders have gone forth to take no business except that involved in existing contracts, and this applies especially to stel bars which now are almost impossible to place. Some steel bar business for first and second quarters has been booked at 3.75c, Pittsburgh, and some export sales have been made at 4c, Pittsburgh. Many thousand tons are being turned away daily. The minimum on iron bars is 3c, Pittsburgh, but the usual asking price is 3.50c and 3.75c is asked in some cases for shipment out of stock.

Shortage Brings Advance

Pittsburgh, Dec. 16.—In the lack of any improvement in the merchant steel bar supply situation, the shortage of cold-finished steel bars, especially in the smaller sizes and in screw stock, remains extremely acute. While most makers are holding at the old base of 3.60c for carloads, it is reported that one maker recently has offered to take business for shipment in 10 days on a base of 3.85c, while others are stated to be quoting 4.00c or more against new business. Demands still are heavy and insistent and buyers are not balking at premiums in their desire to secure supplies.

Most Makers Quote 3.50c, Base

New York, Dec. 15.—While some business in common iron bars continues to be booked at 3.25c, Pittsburgh, and even 3.00c, Pittsburgh, the makers in nearly all cases are obtaining 3.50c, Pittsburgh. In fact, anything less than the latter price now is exceptional. The market in common iron bars, while not as strong statistically as that in steel bars, is on a firm basis, so that the makers have got away apparently for some time to come from the conditions that only a month ago forced them to take business at or below cost. It now is figured that all of the bar iron makers have enough orders on their books to keep them occupied four to six weeks ahead. Current orders are coming from all sorts of domestic sources with the exception of the railroads. Good orders for export are current chiefly from South America. These export orders in some cases involve up to 300 tons each.

Recently, the bar iron makers association adopted certain changes in differentials. By the new schedule, the base price of 3.50c, Pittsburgh, applies to common or refined iron, rounds and squares, from ½ inch to 3 inches, and flats, ¼-inch to 1-inch thick and up to 6 inches wide. Rounds, ⅜ and 7/16-inch, take a 4.20c, Pittsburgh, base; rounds and squares, less than ⅜-inch, and flats under ¼-inch thick, 4.50c; hexagons, ovals, half ovals, and half rounds, 4.50c; and flats wider than 8 inches, and ¼-inch thick and heavier, 3.80c. Double refined iron takes an extra of 1 cent.

Prices Still Rising

Pittsburgh, Dec. 16.—Another advance of $5 a ton has just been announced by the leading makers of iron bars in this district putting the market on a basis of 3.50c for common bars and 3.75c for refined. This advance puts common bars back to the old war industries board base, but leaves refined iron about $10 a ton below the price established by that board. The demand for iron bars is on an enormous scale, with the Pennsylvania railroad making frequent inquiries for both common and specification iron, while chainmakers also are in the market for supplies. Makers also are profiting by the scarcity and sold-up condition of soft merchant steel bars and present bookings will carry them well into the new year. Small rounds in iron bars are quoted at 4.00c and this base also is quoted on iron bands. Makers of merchant steel bars have at least two months' business in sight while the Carnegie Steel Co. is reported to be sold up over the first half of next year. The latter company is holding to the old March 21 base of 2.35c, Pittsburgh, but it is doubtful if more than one or two independent makers would consider a price of less than 2.75c, Pittsburgh, while on prompt tonnages buyers have offered 3.00c or more, Pittsburgh. With the settlement of the coal strike it is believed that within the next few weeks mill operations will be on a heavier scale and that shipments against accumulated business will be freer than they are now. Demand for concrete reinforcing bars is heavy and makers of rerolled bars of this sort serving this district are not quoting less than 3.00c and some business actually has taken place at 3.25c and even higher. Bookings of both these and new steel reinforcing bars are heavy.

Makers Turn Down Inquiry

Chicago, Dec. 16.—Demand for bolts and nuts is immense and all makers are turning down much of the inquiry which reaches them. The business thus turned away in some instances reaches millions of pieces, but it is utterly impossible for mills to care for the total offered. Fuel shortage has caused much loss of time.

Premiums of $6 to $9 a Ton

Pittsburgh, Dec. 16.—While the Carnegie Steel Co. and some of the independent companies still are quoting hoops and bands at the old base of 3.05c, Pittsburgh, no tonnages of either are available for early shipment at this figure for all makers are heavily committed and production still is considerably below normal. As a matter of fact, those makers who have any prompt tonnage for sale are having no trouble in making sales at 3.30c, base Pittsburgh, and some sales are reported as high as 3.50c or from $6 to $9 per ton over the old base.

English Ferro is Offered

New York, Dec. 15.—An importer of English ferromanganese has been authorized by his British principal, to offer ferromanganese for second quarter delivery at $120, c.i.f. Baltimore. This authorization is limited to 1000 tons. So far, no business has resulted, due to the fact that there is no active inquiry at this time. In fact, no business of any moment in the ferromanganese market has been reported in this district during the past week. The price on domestic metal continues $120, delivered.

In spiegeleisen, the market also has been inactive during the past week, and while there is a fair amount of inquiry out, there is no hurry about closing. Small business has been done at as high as $41.25, furnace, for 20 per cent spiegeleisen, but this figure is exceptional, and the general market on sizable lots, on the basis of what has been done, may be quoted at $40, furnace, for 20 per cent. Included in the business of the past week is one lot of 250 tons of spiegeleisen for export.

Ferrosilicon Prices Soft

Pittsburgh, Dec. 16.—Efforts of producers of 50 per cent ferrosilicon to

establish higher prices have failed and while $85, furnace, freight allowed, has been done on one or two small tonnages, the largest sale lately reported here, one involving about 700 tons, carried a price of below $80. It has been the experience of sellers who have quoted more than $80 on this material that the order has not followed. Bessemer ferrosilicon also is extremely slow of sale and as far as this market is concerned the base of $59.50, furnace, is merely a quotation. Much tonnage remains on the furnace yards under contract, but shipping instructions are few and hard to obtain, though the present quotation is about $5 per ton above the basis of the contracts.

Domestic makers of ferromanganese still are holding at $120, furnace, freight allowed, for 80 per cent material and are getting a fair number of small orders, mostly for prompt delivery. Sale of 1000 tons of English ferromanganese running 76 to 80 per cent at $110, c.i.f. Baltimore, made here about 10 days ago, still waits word of the maker that shipments can be made. Fairly good demand is noted for spiegeleisen, but sales are neither large nor numerous. One eastern maker is quoting small tonnages at $37, furnace, lots of 100 tons or more, at $38, for prompt shipment, and $40, furnace, for first quarter shipments.

Ferro Selling Well

Chicago, Dec. 16.—Ferromanganese is in fair demand, with recent sales being made in 300 to 400 tons lots at $120 per ton, furnace, freight allowed. This price is higher than the quoted figure on imported English ferro, but material moves readily at that figure.

English Ferro is Sold

Philadelphia, Dec. 16.—An importer after selling considerable English ferromanganese for second quarter at $110 tidewater has withdrawn. Another is offering material for this position at $120 tidewater but has only 1000 tons to sell. He has made no sales as yet. Domestic makers continue to ask $120 delivered. The speigeleisen minimum now is reported as $40 furnace.

Tin Plate Mills

Planning Early Resumption—Black Plates Eagerly Sought

Pittsburgh, Dec. 18.—While a number of tin plate mills, recently shut down because of the fuel scarcity, are making plans to resume at an early date now that the coal strike is over, doubt is expressed that the fuel situation will be normal until after the first of the year. An acute shortage of early tonnages still exists and makers still are besieged with inquiries, few of which they are able to do anything with. Demand for black plate is extremely urgent as the margin between it and fully finishd tin plate is so great that few makers now are inclined to sell much black plate, preferring to take advantage of the extra profit there is in the fully finished material. Buyers are offering considerably more than $7 Pittsburgh, for standard tin plate.

Ship Plates in Demand

100,000 Tons Booked at Chicago—Pittsburgh Figures on 65,000 Tons—Tonnage Up in East—Sell at 3.00c and Ask 3.25c

Pittsburgh, Dec. 16.—Makers of plates are besieged with inquiries from the builders of tanks, who are so anxious to be covered against immediate and 1920 requirements that they have paid premiums of from $2 to $7 per ton. Some large ship-plate requirements lately have loomed up, and one maker here reports inquiries over a period of two days for approximately 65,000 tons of ship steel. The navy department is seeking 10,000 tons of plates and 4000 tons of shapes for cruisers Nos. 5 and 6, while the Pacific Mail Steamship Co. wants 10,000 tons of plates and 6000 tons of shapes. The Morse Shipbuilding Co. is reported in the market for the steel for two 15,000-ton steamers, which it recently was awarded, and among the other inquiries was one for 4000 tons of plates, shapes and bars for export. Sale of 2000 tons of tank plates for shipment over the first half of 1920 is noted by a valley maker at 2.75c, Pittsburgh, and 1600 tons by a Pittsburgh district maker at 3.00c. The Midvale Steel & Ordnance Co. is reported to be sold four months ahead on plates and to be quoting 2.75c, Coatesville, on western shipments. So heavily booked are all makers that 2.65c, base, Pittsburgh, now is a minimum quotation, and that price is being declined by some whose costs are high.

Quoting Up to 3.25c

Philadelphia, Dec. 16.—After securing considerable plate tonnage at 3.00c Pittsburgh, one eastern plate maker now is asking 3.25c. Those eastern mills which are able to make deliveries under three to six months are asking 3.00c Pittsburgh and this figure is being quoted on some big ship tonnages. The mills asking less, have only deferred deliveries to offer. One maker who last named 2.75c Pittsburgh has enough tonnage to keep his plant busy all of 1920 and some other makers are situated similarly. The Central Iron and Steel Co., Harrisburg, Pa., which was shut down because of the coal strike has lighted three open-hearth furnaces. Among orders placed the past week were 1000 tons of plates for Belgium locomotives.

Renew Ship Inquiry

Chicago, Dec. 16.—Inquiry for steel plates is strong, and the large producing capacity in the West probably will be entirely filled if the present rate of buying continues. Within the past week the leading interest has booked 75,000 tons of material for ships to be built in Pacific coast yards, while other producers have taken about 25,000 tons additional. About two-thirds of this material is plates, and the remainder shapes and bars. The demand for plates for tanks and tank cars for storing and transporting oil continues to bring considerable business to the mills. The Sinclair Refining Co. has placed 416 tons for two tanks at East Chicago with the American Bridge Co. The leading interest has booked about 15,000 tons, mostly plates, for car repair purposes. Plates are steady at 2.92c, Chicago.

Price Limit

Is Lacking in Nails—5000 Kegs Sold at 4.50c

Pittsburgh, Dec. 16.—Little or no improvement is observed in the position of makers of wire and wire products in the matter of their ability to accept business and prices still show a strongly upward tendency as a result of the efforts of buyers to secure supplies to carry them along. A sale is noted of 5000 kegs of nails at 4.50c, base Pittsburgh, for first quarter delivery, while in small lots for immediate shipment buyers know no price limits in their desire to secure supplies. While the American Steel & Wire Co. has made no change in its prices, still holding to 3.25c, base, for nails and 3.00c, base, Pittsburgh, for plain wire, this company is out of the market as far as new business is concerned and its quotations have found no recent basis in sales. Sales of plain wire recently have been made at 3.50c, base, Pittsburgh, while as much as 4.00c, has been obtained for coated nails. Sellers' price views not only are influenced by the attitude of buyers as to price limits but also by the fact that wire rods have moved up sharply over the old base price of $52, now being salable at anywhere from $63 to $67 and in some cases even more for soft steel.

Mills Take no Orders

Chicago, Dec. 16.—Wire and nail mills in the West continue their policy of accepting no further orders until the situation clears. They are loaded with business and unable to operate at full capacity and the wisdom of taking on further obligations is doubted. The shortage of wire and nails is becoming more acute, and consumers are using every effort to obtain shipments, while mills are spreading their shipments over as much territory as possible to serve all users.

Completes Furnace

The Worth Steel Co., Claymont, Del., has completed a fourth open-hearth furnace of 100 tons capacity, which is expected to be ready to be lighted next month. The new furnace will give the Worth Steel Co. a total of four open-hearth furnaces, each of 100 tons capacity. It is expected that two or three more open-hearth furnaces will be built during 1920. The company also has commenced preparing foundations for a second plate mill.

Awards More Numerous

Week's Record of Structural Contracts Include Many Good-Sized Tonnages—November Total Announced as 124,200 Tons

New York, Dec. 16.—A reduction of 8.50 per cent in structural lettings for November is shown by the regular monthly statement of the Bridge Builders and Structural society, just issued. The tonnage let in November amounted to 124,200, or 69 per cent of capacity, as compared with 139,500, or 77.50 per cent of capacity, let in October. Following is a comparative statement of monthly bookings reported by the Bridge Builders' society:

Month	Per cent	Approximate tonnage
November, 1919	69	124,200
October	77½	139,500
September	78½	141,000
August	78½	141,000
July	74	133,200
June	65	177,000
May	49	88,200
April	24½	48,100
March	17½	32,300
February	12½	22,500
January	12	21,600
December, 1918	29	52,270
November	27	48,700
October	43	77,400
September	60	108,000
August	57	102,000
July	116½	209,700
June	56	100,800
May	60	108,000
April	64	115,200
March	47	84,600
February	55	99,900
January	53	95,400
December, 1917	121	205,200
November	77	138,600
October	61½	110,700
September	29	52,200
August	38	68,400
July	41½	74,700
June	47½	85,500
May	56½	102,000
April	61	110,000
March	68	122,000
February	59	106,000
January	61½	119,000
December, 1916	86	148,000
November	78	134,000
October	77	133,500
September	52½	99,400
August	64	112,600
July	47½	83,600
June	58	100,000
May	80	137,000

Structural bookings during the past week exceeded inquiries. The larger awards included 2000 tons for a power house at Johnstown, Pa., 1500 tons for the International Tailoring Co. building, New York, and 1000 tons for the Park National bank, New York. Two lots of 875 tons for the Museum of Art, Philadelphia, and the store addition of A. I. Namm & Co., Brooklyn, also were awarded. Formal announcement was made of the award of 2300 tons for a loft building for Benjamin Hass, New York, and 1800 tons for a telephone exchange on Thirtieth street, New York. One eastern shape mill has recently advanced its minimum price from 2.45c, Pittsburgh, to 2.50c. Minimum shape prices in the East now range 2.50c to 2.55c, Pittsburgh.

Takes 1920 Business at 2.55c

Philadelphia, Dec. 16.—The minimum price on structural shapes for eastern mills is now 2.55c, Pittsburgh. At the same time there seems to be little disposition to press for more. One mill is taking some first quarter business at this level. The leading eastern maker has closed some schedules 10 to 12 weeks ahead, and in some cases will make deliveries in four to six months. Inquiry is good, but not sufficient to swamp mills.

Falling Behind in Deliveries

Pittsburgh, Dec. 16.—Shape mills in this district have become so heavily committed as a result of the large and urgent demands of the past couple of months that the interruption to operations occasioned by the coal shortage has caused most of them to fall behind in their deliveries and mill quotations carry no guarantees as to delivery dates. Piling up of orders for small shapes has been particularly heavy, due to a desire upon the part of users to be protected by contracts. The big accumulation of merchant bar orders, not to mention the extra labor required, has directed more bar mill capacity on bars than on small angles, beams and channels. Most of the structural contracts recently let have been extensions involving small tonnages and early delivery. Such jobs pay a higher price than the larger projects and because of this fact fabricating interests, unable to secure quick shipments from mill, have sought supplies from warehouses and paid the usual premiums of $10 to $15 per ton. While the Carnegie Steel Co. still is quoting and taking business at the old March 21, base of 2.45c for beams, some of the independents are booking as high as 2.60c, base, Pittsburgh. No important structural awards have been placed in this market in the past week, although a number of promising inquiries have come out. Tank builders are heavy buyers.

West Takes Large Tonnage

Chicago, Dec. 16.—Demand for structural shapes is improving and many contracts are being closed, some involving fairly large tonnages. The largest project is an addition to the Arthur Letts building at Los Angeles, involving 3000 tons. The mills are somewhat short on deliveries of structural material, in common with other forms of steel, but so far fabricators have not suffered from this fact. Plain material continues to be quoted at 2.72c, Chicago mill. No award has been made on 15,000 tons for the Chicago Union station on which bids are in.

CONTRACTS AWARDED

Building for Biltmore Country club, near Rye, N. Y., 1200 tons, let to Heddon Iron Construction Co.

Factory for General Leather Co. in Denmark, 700 tons; let to Hay Foundry & Iron Works.

Factory for Duretex Mfg. Co., 300 tons; let to Hay Foundry & Iron Works.

Addition to Arthur Letts building, Los Angeles, 3000 tons, to Baker Iron Works.

Paris-Hugo bridge over Red river, Hugo, Okla., 850 tons, to Virginia Bridge & Iron Co.

Two oil tanks at East Chicago, Ind., for the Sinclair Refining Co., 416 tons, to American Bridge Co.

Steel for ore cars for the Alaska Juneau Gold Mining Co., 260 tons, to independent shop.

Theater building at Okmulgee, Okla., 230 tons, to Illinois Steel Bridge Co.

Structural steel for warehouse at Alton, Ill., for the Laclede Steel Co., 276 tons, to Decatur Bridge Co.

Portage Park theater at Milwaukee and Cuyler avenues, Chicago, 186 tons, to Federal Bridge Co.

Boiler house for No. 5 shaft, Isle Royal mine, Houghton, Mich., for the Calumet & Hecla Mining Co., 125 tons, to American Bridge Co.

Awarded for Intenational Tailoring Co., New York city, 1500 tons, to Hay Foundry & Iron Works.

Loft building for Benjamin Hass, New York city, 2300 tons, formal announcement of award to Levering & Gerrigues.

Power house for Penn Service Corp., Johnstown, Pa., 2000 tons; to American Bridge Co.

Store addition for A. I. Namm & Son, Brooklyn, 875 tons; to Bethlehem Construction Co.

Telephone exchange on East Thirtieth street, New York city, 1800 tons, formal announcement of award to Hay Foundry & Iron Works.

Addition to Susquehanna Silk Mills, Huntington, Pa., 300 tons, to American Bridge Co.

Factory addition for Penn Rubber Co., Jeannette, Pa., 600 tons; to independent.

Building for Park National bank, New York city, 1000 tons; to Harris Structural Steel Co.

Telephone exchange in Bronx, New York city, 270 tons; to Hinkle Iron Co.

Apartment hotel, in Philadelphia, 650 tons; to American Bridge Co.

Museum of art, Philadelphia, 875 tons; to the American Bridge Co.

Building for Farr, Alpaca Co., Holyoke, Mass., 300 tons; to American Bridge Co.

Plant addition for H. H. Franklin Mfg. Co., Syracuse, N. Y., 300 tons to American Bridge Co.

CONTRACTS PENDING

Addition to Hamilton club, Chicago, 600 tons, bids asked.

Plant extension for Feurstein Ice Co., Nofolk, Va., 1400 tons indefinitely postponed.

Slow Return

In Mill Pipe Production Is Shown—Heavy Orders in Market

Pittsburgh, Dec. 16.—While the outlook for larger operations by the pipe mills is brighter as a result of the settlement of the coal strike and the easing up in the supply situation, little actual increase yet has come about at the various plants in this, the Wheeling and the valley districts. The National Tube Co. continues to concentrate mill activities in the products where the orders are heaviest and the indications are that not only this company, but all others will operate on a rather restricted scale until the turn of the year. A large number of men who were out on strike at the Riverside works of the National Tube Co. at Benwood, W. Va., have returned and the company now has two pipe furnaces in operation at this plant at which was located a fairly large stock of coal. It is expected that the Wheeling Steel & Iron Co., Wheeling, W. Va., shortly will resume operations as the men who have been out at this plant recently voted to resume work and call off the strike. Jobbers' stocks have become so thoroughly depleted by the demands of the past few months that in the lack of new production buyers in need of early tonnages find it extremely difficult to place them. Inquiries involving a large amount of line pipe are on the market and some heavy tonnages of oil country goods are seeking makers. The situation in standard pipe also is acute although not quite so taut as that in oil country pipe. Bookings in oil country and line pipe run as far ahead as Jan. 1, 1921, with some makers, while in merchant pipe hardly a manufacturer today has less than three months business in sight.

Private Demand Heavy

New York, Dec. 15.—Bids are to be closed tomorrow by the city of

Newark, N. J., on approximately 1500 tons of 24-inch cast iron pipe. No other municipal tonnages of consequence are reported. Private demand continues to come in heavy volume.

Shops Face Good Winter

Chicago, Dec. 16.—Cast iron pipe shops are entering the winter in better condition than has been the case for many years. Late buying has afforded large tonnages at the season when buying usually is light. Part of this backlog is due to the difficulties met with during the fall when pig iron supplies have been fairly scant and fuel has not been as plenty as usual. The United States Cast Iron Pipe & Foundry Co. has taken 120 tons at Cincinnati. Bids were to be opened Dec. 15 at Sandusky, O., on 103 tons and Dec. 16 at Toledo, O., on 1570 tons. Venango, Nebr. will take bids Dec. 29 on 80 tons. No award has been announced yet on the inquiry for 5000 to 7000 tons on which bids were taken recently at Elyria, O.

Steady Operations in South

Birmingham, Ala., Dec. 16.—Active operations at cast iron pipe plants in the southern territory continue and production during the winter will be good. Shipment of pipe is being maintained, and new specifications are coming in. Recent quotations are unchanged, though advances are expected.

To Erect Strip Mill

A universal mill will be erected at Bridgeville, Pa. by the Pittsburgh Open Hearth Steel Co., recently organized. The officials plan to roll strip steel for the automobile trade and for heavy stamping purposes.

Sheet Bars Are at $50

This Figure Now Appears Minimum—Report of Higher Sales—Slabs Bring $50—Semifinished Market Difficult to Define

Pittsburgh, Dec. 16.—Prices of practically all kinds of semifinished material still are headed upward, due to the fact that supplies available for early delivery are far short of demands. Sales of fair-sized tonnages of 4x4 billets are being made by manufacturers in this district at $45, with the usual differentials for sizes above and below the standard dimensions. Small sales of slabs are noted at $47.50 and also $50. For sheet bars, either open hearth or bessemer, $50 now appears to be the more general minimum as about the only tonnages becoming available are those released by some manufacturer who has received the steel on contract and for some reason or other is unable to use it. In view of the fact that substantial premiums are being paid on prompt tonnages of sheets, these manufacturers are unwilling to let the semifinished steel go for any smaller relative profit than they could obtain for the finished material. Demand for wire rods recognizes no price limits and while some business has been done at $63, Pittsburgh, for the base grade, considerably more tonnage has sold at $65 and even $67 has been obtained by some makers.

Talk $51 on Sheet Bar

Youngstown, O., Dec. 16.—If makers in this district were in a position to take on any sheet bar tonnages, they easily could get $51 or better. However, no sheet bars are available at Mahoning valley mills. This last week several offers of $50 were making the rounds but no sales were made so far as can be learned. Some spot business recently was done at $57 in a nearby district according to a dealer here. All makers of sheet bars here, however, are out of the market for first quarter and refuse to consider any business beyond that period until they determine where their costs stand and until they work off considerable business which accumulated due to the recent labor troubles and coal shortage.

Sell Slabs at $50

Cleveland, Dec. 16.—Strength continues to characterize the market on semifinished material and sellers are able to obtain high prices if they are inclined to ask them. This makes the situation lacking in price uniformity and a considerable range is represented in going business. However, the trend is steadily upward. As an example of this condition, a maker in this territory sold a tonnage of slabs in the week at $50, Youngstown, while another interest accepted $42, Youngstown, on 1000 tons of small billets. No sheet bars are being offered and there seems little doubt but that they would bring $50 or more on a sale.

New York Sheets Up

New York, Dec. 15.—A leading warehouse interest today advanced its prices on sheets 25 cents. The market on No. 10 blue annealed now is holding at 5.07c to 6.00c; No. 28 black, 6.25c to 7.50c, and No. 28 galvanized, 7.50c to 9.50c. This interest is also to announce shortly an advance in machine bolts, which are now quoted at a discount of 40 per cent on the smaller sizes and 30 per cent on the larger. It is likely the advance will amount to about 5 per cent. Rivets will advance.

No Let-Up in Demand

Boston, Dec. 15.—The general business quietness expected at this time of the year has not been noticed in warehouse business. Demand for sheets especially has been so great that some concerns have completely exhausted their stocks of certain lines. Some of the smaller warehouses in Boston have made price increase above the schedule adopted by the larger interests.

Stocks Low; Supplies Limited

Philadelphia, Dec. 16.—Warehouses here are having great difficulty in replenishing stocks, which are very low and incomplete. Prices asked vary, but the market here may be quoted about as follows on material out of stock: No. 10 blue annealed sheets, 5.00c to $5.25c; No. 28, black, 6.50c; No. 28 galvanized, 7.50c; steel bars, 3.60c; iron bars, 4.00c; plates, 3.60c; shapes, 3.70c.

‡Open market.

NEW YORK, Dec. 16.—The erratic movement of the sterling exchange market has been a prominent factor in the nonferrous metal market the past week. Sterling rates declined steadily to about 3.66, where export inquiries began to taper off. Down to $3.70 export inquiry was brisk and a heavy volume of business was transacted with Great Britain and the continent in zinc. Japan bought about 5000 tons of copper last week for first quarter delivery, while Germany and France also bought further tonnages. Foreign demand for lead continued and sales were made of bonded lead at prices about 6.50c, New York. The tin market, on the other hand, moved from day to day in accordance with the drop in exchange. Changes of 1c to 1½c a pound per day in the price of tin have not been unusual and have been due almost wholly to sharp changes in exchange rates.

The copper market was steady during the week at around 18.50c for electrolytic for first quarter delivery. Some sales were made as high as 18.62½c and some as low as 18.37½. Dealers continued to find it difficult to obtain copper due to the producers' policy of doing business only with consumers. Dealers have been holding crucible copper at high prices, asking 18.50c for this material in less than carload lots, which has meant that casting copper makers could not compete with electrolytic copper to any extent at present.

The zinc market slumped somewhat after exchange rates dropped to $3.66 and prime western fell from 8.50c to 8.25c. East St. Louis basis. At the lower price domestic galvanizers and brass mills showed increased interest. High grade zinc sold at 9c to 9.12½c delivered.

The tin market has been extremely irregular. Straits tin both for spot and future deliveries was held at 54.25c Dec. 9. By Dec. 12 it was available at 52.75c, owing to declining exchange rates, but on Dec. 15, an advance of £6 at London and a recovery of 4 points in exchange stiffened the market to 54c to 54.25c. Demand has been light, tin plate makers and other consumers having shown little interest because of the coal strike and also because of the recent heavy shipments from accumulated supplies in the port of New York.

The American Smelting & Refining Co. followed its lead price advance of Dec. 5 with another advance as of Dec. 12, this time the rise amounting to $2 a ton and bringing the price to 7c New York, 6.75 East St. Louis. Sales were made in the outside market at 7.25c New York, 6.95c East St. Louis.

Antimony was stronger at 9.75c for spot, duty paid, New York.

Shutting Down on Exporters

Refusal of Mills to Take Foreign Orders Causing Distress in International Markets—Dutch Buy Large Tonnage of Rails for Future Delivery —135,000 Tons of French Shell Billets Sold

NEW YORK, Dec. 15.—Speculation inspired by the advancing prices is resulting in considerable confusion and no little injury to the export trade. Legitimate exporters are finding it difficult to hold foreign customers to firm orders so long as this speculative tendency exists. They are finding it extremely difficulty to persuade their customers that no iron or steel commodity can be obtained in the present market at the March schedule of prices. It is necessary to pay anywhere from $20 to $40 a ton premium and even then it is uncertain whether such an offer will bring forth an agreement from the mill to accept the order. The case of No. 28 galvanized sheets, which bear a base price of $5.70, Pittsburgh, may be taken as a typical example. The exporters declare that it is necessary to pay at least $1.50 premium, making the actual cost of the sheets $7.20, Pittsburgh. Foreign clients are not infrequently confused with the quotations they read on American material and it is difficult to convince them that the quoted schedule is not the price at which the commodities now are being sold.

Despite the English orders that are now and then placed, a gradual diminution of the business is apparent. Many quotations offered to English colonies are meeting with rejections although some business has to be placed as a matter of necessity as the English mills cannot make the deliveries. The large purchases recently made by the Chilean government on railroad account included only such material as the Chilean railroads were compelled to have. Business which was possible in South Africa is being canceled, and Australia now has an embargo on many commodities from the United States. To ship goods into Australia it is necessary to have an import permit and only such material as the country finds essential is being granted admission.

This prohibition of imports is a drastic method to check the decline in exchange but it was forced upon France early. The situation is undoubtedly in part responsible for the reported sale of 135,000 tons of French shell steel billets to an American dealer. That transaction was one of the largest consummated for some time, involving several million dollars. While the French came into possession of these billets through old war contracts they have been held on this side of the Atlantic. The specifications of the billets are carbon .35, silicon 1.15 to 1.25, manganese .50 to .80, phosphorus .03 to .08, maximum sulphur .05. They run in sizes from 3¼-inch up to 10 or 13 inches.

The settlement of the coal strike holds out a glimmer of hope for the exporters although for some weeks it is not expected that the mills will be ready to receive inquiries. According to the word that has been passed around the market here the exporters must wait until Jan. 15 before any promises can be given by the producers.

The United States Steel Corp. has taken an order for between 15,000 and 18,000 tons of steel rails from Holland for the Dutch East Indies. Deliveries on the contract, it was said, will be started within the next 60 days. This order was considered important in view of the fact that the United States successfully competed with several European mills for the contract.

Some European Business

It was reported in equipment circles that Belgium is in the market for 10,000 freight cars. The companies are in a good position to take on this business, but the question of financing any order of this size is considered the chief stumbling block to its acceptance.

England has sent in an inquiry for 2000 tons of billets, but the exporters despair of placing the order on account of the disparity in exchange. England has been purchasing some little mattress wire and has been taking some choice grades of iron and steel scrap. London has been inquiring for 100 kilometers of portable track. It is believed that this was intended for South Africa, but the order was not placed. Italy also is said to have inquired for 4000 tons of bars and the inquiry is now going its rounds of this market.

South American inquiries call for cars, rails, sheets, wire, pipe, bars and plates. The volume of these inquiries is not nearly so great, it is believed, as they might be were we prepared to extend the Latin-Americans substantial credits. Much of the financing of South American industries has been done in London and consequently so long as supplies for these industries cannot be had in England they are purchasing only their immediate necessities from the United States. The sales to South America include plates, pipe, bars and hoops, although they are in small lots. A sale of 750 tons of bars to Argentina was reported by one house. The same house said it had received orders from Argentina for some 50,000 reels of barbed wire within the past two weeks but not all of this business has been placed with the mills. Brazil is now inquiring for some 500 railroad cars, and 10,000 tons of 70 and 80-pound rails.

Inquiries from South America passing through the general trading houses are small and few, probably due to the speculative state of the market and the specialty training required to fill orders. One such house, however, acknowledged the receipt of a South American inquiry for bars and hoops. The tonnage in each case was small. Another house reported the sale of approximately 700 tons of wire to Argentina and Brazil within the past two months.

Some of the exporters are beginning to complain of the manner in which inquiries from South America are being received. They ask for odd assortments of material and give unusual specifications. In this market it is practically impossible to do any business on such a basis. A typical South American inquiry just received asked for 500 tons of channels, 500 tons of angles, 250 tons of black sheets, 600 tons of mild steel plates, 900 tons of special wire and 18,000 coils of black varnished wire.

An inquiry for 1000 tons of bars has been received from Japan. A similar inquiry has been received from China. The lowest quotation brought out on this was $3 per 100 pounds, Pittsburgh, although some of the mills asked $3.50.

An important trading house has placed a few orders for a few hundred boxes each of nails for China and Japan. Previous orders placed for the same customers have been in thousands of kegs. These nails brought $5 per 100 pounds, Pittsburgh, but there has been an asking of $5.50 for similar nails for second quarter.

British Steel Growing Scarcer

Lack of Billets Forces Suspension of Many Rerolling Mills—Rails Advanced to $65.28 – Output of Some Steel Works Reduced 50 Per Cent as Railroad Congestion Forces Furnaces to Blow Out

The Iron Trade Review Staff Cable

European Headquarters,
THE IRON TRADE REVIEW,
16 Regent St., S. W. I.,
London, Dec. 15.

Rate of Exchange—3.73

THE steel scarcity in Great Britain is increasing. Some structural engineers now have nine-tenths of their work held up because of the fact. Semifinished steel from America is greatly missed. Many rerolling works have stopped operations for want of billets. Heavy steel rails have been advanced to £17 10s ($65.28). Scarcity of railroad cars has compelled many blast furnaces to blow out or damp down, and has reduced output of some steel works 50 per cent.

Derbyshire pig iron has been advanced 2s 6d ($0.47) Sellers often accept only half the tonnage offered. Basic pig iron is very scarce. Galvanized sheets have increased to £39 ($145.47) and orders are generally refused.

Sixty thousand tons of tin plate have been ordered by Japan and continental buyers are offering heavy premiums for supplies. The molders' strike is causing great distress through unemployment.

Office of THE IRON TRADE REVIEW,
Prince's Chambers, Corporation Street,
Birmingham, Eng., Dec. 4.

Rate of Exchange, $4.01

PIG iron continues in strong demand, although the continuance of the molders' strike has greatly reduced the call for the best grades. The unsatisfactory quality of fuel keeps down the proportion of best iron. The deficient output largely is due to railroad congestion, and the insufficiency of cars which keeps numerous blast furnaces in constant danger of stoppage. One of the largest Black country concerns has at the present time 75 cars distributed among different collieries but is unable to get supplies, and will be obliged to stop operating in a few days.

Prices generally are unchanged, the only exception being No. 1 Cleveland iron which has been advanced for home and export 3s 6d (70 cents) per ton, making the home price 167s 6d ($33.58) and the export price 172s 6d ($34.58). This is practically unimportant, as so small a proportion of this particular grade is sold. Higher prices, however, are expected for pig iron when the situation is sufficiently settled to enable safe decisions to be taken. There have been good sales of Northamptonshire and Derbyshire foundry iron at recent prices. A certain amount of foundry material from the north of England is going to Scotland, where the molders are still at work. An attempt to extend the molders' strike to Scotland has failed. The pig iron situation in the East coast hematite trade is rather easier, chiefly because the steelworks cannot obtain cars to convey pig iron. The stoppage of several important steel mills in the north of England has already compelled some pig iron to go into stock. The position of the trade is serious, as the result of the railroad situation. The molders' strike with the extensive stoppages of engineering works has seriously affected the Barrow steel district, where the supply of steel is decidedly in excess of the demand. There is a strong demand for basic pig iron, which appears to be entirely below the requirements of the trade. In south Staffordshire, several furnaces are damped down or blown out because of the scarcity of fuel, combined with the molders' strike.

The situation remains extremely uncertain, in view of the recent regulation of coal prices, no declaration having yet been made with regard to coke. For the time being it is assumed that coke, like works coal, will maintain its price.

The finished iron and steel market is firm, partly due to the belief that prices must advance. Orders are plentiful for all descriptions, and especially for gas strip, for which local makers of tubes have depended mainly this year on American supplies. Some of the Staffordshire strip mills have lately been without orders on this account. A fortnight ago tubemakers placed heavy orders with local strip mills at the standard rate of £22 10s ($90.22), but the makers now decline to accept less than £24 ($48.24). Premiums have been offered frequently to secure all grades of iron, and numerous makers have now called on their customers to pay premiums ranging between 10s ($2) and £2 ($8.02) on old contracts.

The scarcity of semifinished steel is causing great difficulty, and is reducing the output of the finishing mills. The supplies of billets from America, which were useful while they lasted, are now sorely missed. The largest consumers have hastened to place heavy orders with the great South Wales firms with a view to securing the first production in the new year, but this leaves the present urgent need entirely unsatisfied. In the meantime, prices are advancing, makers who have billets to sell obtaining from £16 ($64.16) to £16 5s ($65.16) per ton. The demand for

finished steel is enormous, especially for joists and girders.

There is a large amount of unemployment in the country, nearly 11,000 registering as unemployed in Sheffield last week.

The galvanized sheet trade is busy, but a great deal of work has to be refused owing to the inability of manufacturers to obtain transportation of steel and spelter and delivery of the sheets when they are finished.

The tin plate trade although working under boom conditions is hampered greatly by railroad congestion, which deprives mills of the necessary material, and makes it impossible to keep the works fully employed. A special conference held in South Wales made strong representations to the government to secure an improvement in traffic facilities. The demand for tin plates is enormous, one inquiry alone from the salmon packers on the Pacific coast of America running into 100,000 boxes. Quotations are steadily advancing and are now 46s ($9.22) to 47s ($9.42) per box.

There is every probability of a general advance in finished steel, several manufacturers by personal negotiation having put up their prices by 10s ($2) to 15s ($3) per ton. Buyers who have been hoping for supplies either from America or the continent have now made up their minds that this country can be the only possible source of semifinished steel for a long time, and they are pressing their orders on the market, the natural effect being to further stimulate the high values.

I. W. W. Use Dynamite in Range Town

Duluth, Minn., Dec. 16.—I. W. W. agitators are becoming more active in northern Minnesota iron mining and lumbering districts, and outrages attributed to them are being committed. Last night the house of Chief of Police Coffey at Ely, Minn., was damaged by a dynamite explosion. The house was shattered but no member of the family was injured. Windows of business places in Ely were covered with I. W. W. "stickers" during the night, and it is assumed that the "reds" took that way of defying the police authorities who were active in maintaining order in the town during the recent strike of miners. Federal authorities in all mining towns on the ranges are trying to run down agitators, and assistance is being given by members of the American Legion.

Coal Scarcity Still Affects Western Mills

Chicago, Dec. 15.—Little difference in operation of iron and steel mills has resulted from the coal strike being settled, and the effects of the strike are expected to last in some degree through the remainder of the winter. Small mills which had no reserve of coal and used up everything in their yards have no expectation of turning a wheel before Dec. 29, and then only if shipments started now are hurried through to them. Most of those in this position believe that Jan. 5 will be about as early as they can expect to resume.

Larger consumers like the Illinois Steel Co., and Inland Steel Co., which carried a reserve for winter use are in better position and can resume larger operation at once, but during the strike they have drawn from their reserve of coking coal to supply the lack of mill coal, and supplies now are short.

Continued operation through the winter depends largely on whether weather conditions allow continuous shipment of coal. No attempt has been made up to this time to increase the number of furnaces in blast and probably this will not be done for another week or two, after conditions become clearer.

Mills Planning to Resume as Coal Arrives

Youngstown, O., Dec. 16.—An early resumption of operating schedules is contemplated by steel plant officials here with the release of several hundred cars of coal since Saturday. The 10 and 20-inch skelp mills and the 8 and 10-inch continuous bar mills at the Brown-Bonnell plant of the Republic Iron & Steel Co., were placed in operation Monday. These mills have been idle since Sept. 22. Officials planned to charge some of the open hearths Wednesday. The Bessemer plant has been operating at full capacity since Monday morning.

While considerable coal was shifted into the mill yards of the Trumbull Steel Co., Warren, O., early in the week still the tonnage was not sufficient to warrant immediate resumption in all departments. By Wednesday, it is thought, enough fuel will have accumulated to start several sheet and blackplate mills and perhaps a few open-hearth furnaces. The strip mills at this plant have been rolling steadily.

The Liberty plant of the Trumbull company at Leavittsburg, O., operated only partially last week and if incoming shipments of coal continue at the present rate all units at this plant will be placed on the active list by next Monday. Last week the Brier Hill Steel Co. narrowly escaped a shutdown but this week finds all departments in steady operation. The Youngstown Sheet & Tube Co. reports partial operation but hopes to have additional units in action before the end of the week. Practically 100 per cent operation is being maintained by the Carnegie Steel Co.

Unfilled Bookings Increase

For the sixth consecutive month unfilled bookings of the United States Steel Corp. on Nov. 30 aggregated 7,128,330 tons, an increase over the preceding month of 655,662 tons. This is the biggest gain since July when bookings increased 685,806 tons.

A comparative monthly table follows:

Date	Total	Change, tonnage	Change, per cent
Nov. 30, 1919....	7,128,330	655,662+	10.12+
Oct. 31, 1919....	6,472,668	188,030+	2.90+

Buys Steel Tonnage

Briggs & Turivas of Chicago, have purchased from the United States shipping board, Emergency Fleet corporation of Philadelphia, the latter's entire surplus of fabricated and unfabricated steel. The estimated quantity is approximately 300,000 tons.

The Ward Tool & Forging Co., Latrabe, Pa., organized late last summer, has completed and equipped its new plant. It started operations recently.

Fig. 1—A poorly lighted machine shop. This is an interior view of a room adjoining the well illuminated assembly room shown in Fig. 2

Good Lighting Aids Production

Tests Conducted to Find Relation of Lighting and Production Show That Substitution of Proper Lamps and Reflectors for Antiquated Equipment Increased Output by From 2 to 35 Per Cent

BY WARD HARRISON

IT HAS been only in the past three or four years that lighting, in the minds of factory executives, has been taken out of the janitor service class and placed with automatic machinery and labor saving devices, where it belongs. Now manufacturers are beginning to realize that it is a substantial aid to production and already six states have adopted codes of lighting requirements for industrial establishments and in three other states prospective codes are being drawn up.

In the state codes, intensities of lighting for various classes of operations are specified depending upon the nature and fineness of the detail to be observed, the closeness of application required, and the color of the working surfaces. These intensities are designed only to protect the life and to a reasonable extent the eyesight of the operative who must work long hours under these conditions. In halls, passages and stairways, the codes provide for intensities just high enough to enable the workman to find his way in safety. A well known insurance company is responsible for the statement that more people are killed by tripping or falling in poorly lighted areas than are killed by automobiles in the United States. It also is stated that 24 per cent of industrial accidents, as determined by an analysis of 91,000, are due wholly or in part to inadequate lighting.

However, government requirements for lighting are concerned only with protection and have no bearing upon economical production, which necessitates considerably higher intensities than are specified in the state codes. Recommendations for the proper intensity of illumination for a particular plant depend upon numerous factors such as cost of producing light, the number and wages of employes and the value of their output.

Study Relation of Lighting to Output

Tests to determine the relation of lighting to production, made in Chicago under the direction of the lighting committee of the Commonwealth Edison Co. have aroused considerable interest because of the care with which they were conducted and the conclusiveness of their results. For the purpose of ascertaining the true relation between the amount of light used and the production of hand and machine workmen, four shops were chosen in which the following ideal conditions could be realized:

1. The plant should be able to show actual production accurately for separate machines during definite periods.
2. The product should be standardized so that large outputs may be obtained with all conditions identical except the amount of light used.
3. A fair proportion of the work must be done during the hours of darkness or the factory must be so situated that the daylight is negligible.

The results of these tests showing the increased production obtained under improved lighting conditions are shown in Table III.

In a recent survey of industrial lighting conditions it was found that 25 per cent of the work is done under artificial lighting. If artificial light could be had for the asking, no manufacturer would be content with a lower standard of illumination by night than by day. An idea of the average intensities of day-

---

From a paper presented at the recent annual meeting of the Society of Industrial Engineers, Cleveland. The author, Ward Harrison, is an engineer with the National Lamp Works of the General Electric Co., Nela Park, Cleveland.

FIG. 2—A WELL ILLUMINATED DEPARTMENT OF A SEWING MACHINE PLANT. COMPARE THIS ILLUSTRATION WITH FIG. 1, WHICH SHOWS AN ADJOINING ROOM IN THE SAME ESTABLISHMENT

light illumination for various kinds of manufacturing plants is given by Table I, which summarizes the values found in 17 typical industries. Each figure is the mean of a number of observations and the measurements extended over both clear and cloudy days. An attempt was made to secure data representing good average working conditions and processes were divided roughly into three groups in accordance with the relative necessity for accurate vision. It will be noted that in general the operations requiring the closest attention were ordinarily best lighted, for wherever possible such machines or work tables are located near the windows.

Data such as are summarized in Table I are made possible by the foot-candle meter, a simple and compact instrument recently developed for the purpose of measuring illumination. The screen of the foot-candle meter, on which readings of intensity of illumination are made, consists of a piece of clear glass on which are two thicknesses of paper, one having round holes being fairly opague and the other highly translucent. This screen forms one side of a light box which is constructed so that the screen is illuminated from within to a much higher intensity at the right than at the left. The exposed side of the screen is very nearly uniformly lighted and the round spots appear brighter than the surrounding screen at the right end and darker at the left, as shown in Fig. 3. It is evident that at the point where the spots change from brighter than their background to darker, the illumination on both sides of the screen is approximately the same. After the instrument has been calibrated, illumination intensities may be read on the screen at a glance. The scale reproduced in Fig. 3 indicates an intensity of 5 foot-candles.

Glare is Objectionable

Frequently the presence of direct glare in an artificially lighted room leads to the conclusion that the room is "overlighted", when in reality the illumination is inadequate. In order to approach the daylight standard in artificial illumination the diffusion or softness of natural light must be reproduced by artificial means. For this reason, glare, specular reflection and quality of shadow are factors now receiving increasing attention. All are dependent primarily upon the area of the source of light. In common usage any source of light which is uncomfortably bright is termed glaring, but whether or not a source does produce discomfort is dependent in a large measure upon the brightness of its surroundings and the length of time during which the eye is exposed to its rays. For example, a person scarcely will notice whether or not a bare tungsten filament lamp out of doors in daylight is lighted, but at night the same source is decidedly uncomfortable if close within the field of vision. Again, one may casually look out of an office window during the day and unless the landscape is unusually bright, he will not experience a sensation of discomfort; yet to sit all day at a desk facing this window no doubt would cause pronounced fatigue.

From the standpoint of glare, light sources may be divided into three classes, namely; those, such as an arc or bare lamp filament, which cause discomfort at once; those, like the window, which after a time give rise to fatigue; and those which may remain in the field of view indefinitely without producing any sensation of glare. The conviction is growing that under no circumstances should sources of the first class be tolerated within the field of vision. Those of the sceond class are usually satisfactory for all lighting installations where the light source need not be within the range of vision for a long period, or at worst, not focused continually on the same portion of the retina. In the third class must be included all places where the field of view remains fixed over a considerable period of time.

In addition to direct glare from light

Table I

Intensities of Daylight Illumination

sources, the element of reflected glare or specular reflection, is under certain conditions of equal or even greater consequence. The eyes may be shielded from the direct rays of a lamp, yet the image of this light source, reflected from the polished metal parts of a machine, may be the source of most serious discomfort. It is obvious that the lower the brightness of the source, the lower is the brilliancy and the less the discomfort from the reflected image. If a light source is satisfactory as to glare when one looks directly toward it, in most cases it can be safely assumed that its image will not be disturbing.

The illumination of vertical surfaces is an important factor of industrial lighting. In most factories objects of three dimensions predominate and the illumination of their vertical surfaces is of nearly as much importance as that of the horizontal planes. A good intensity of light on the vertical wall surfaces is also conducive to an impression of brightness and cheer throughout a room. To produce satisfactory vertical illumination a source of light must have fairly wide distribution and must give satisfactory intensity at angles as high as from 65 to 75 degrees from the nadir.

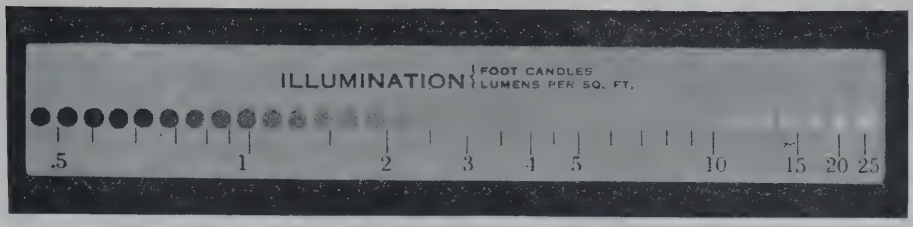

FIG. 3—A SCREEN INDICATING 5 FOOT-CANDLES

Table II

Guide for Selecting Proper Reflecting Equipment

VARIOUS lighting units are rated in accordance with seven fundamentals, the importance of which differs for different classes of service. In finishing automobile bodies, for example, the elimination of reflected glare is of major importance, whereas in a foundry no importance is attached to this factor. The grades assigned are relative and apply only when the units are used with the same size of lamp and under similar conditions.

Maintenance depends on the contour of the reflector, construction of the fixture and condition of ceiling. The rating is based on the labor involved in the units at comparative degrees of efficiency and on the likelihood of the need for cleaning being apparent. The column headed "Favorable Appearance of Lighted Room" refers only to the general or casual effect produced by the complete system and is not intended to rate the unit as to its satisfaction from the standpoint of good vision or freedom from eye fatigue.

A+ indicates .....Best
A indicates .....Excellent
B+ indicates .....Very good
B indicates .....Good
C+ indicates .....Fair
C indicates .....Weak
D indicates .....Condemned

If globes are very large rate B on glare; if very small, C. Rate C+ on glare of the bowl is noticeably brighter than the upper reflector. Ratings apply only where work is being done on polished or oily surfaces.

Type of reflector	Efficiency based on Horizontal illumination	Efficiency based on Vertical illumination	Favorable appearance of lighted room	Direct glare	Reflected glare	shadows	Maintenance
R.L.M. dome Clear lamp	A+	A+	C+	C	D	C+	A+
R.L.M. dome Bowl-frosted lamp	A	A	B	B	C	B	B+
R.L.M. dome Opal cap	B+	B+	B	A	B	A	C+
Enameled bowl Clear lamp	B+	B	C	C+	D	C	A

Enameled inverted Diffusing glass plate bottom	C+	C	A	A+	B+	A	C
Indirect Clear lamp	C	C	B+	A+	A	A+	C

FIG. 4—A TYPICAL INSTALLATION OF INDIRECT LIGHTING. GLARE, WHICH IS AN OBJECTIONABLE FEATURE IN A DRAWING ROOM, IS ALMOST ELIMINATED BY THIS METHOD OF ILLUMINATION

The important question of shadows must be considered. For satisfactory general lighting there must be no shadows so dense as to make vision difficult where the direct light from one or two sources is cut off, nor so sharply defined as to confuse the worker, in other words, shadows should be soft and luminous. It must be remembered that the entire elimination of shadows is not an end to be desired in industrial illumination.

From successful trials of indirect lighting in offices, some factory managers have concluded that the indirect system is ideal for all conditions and that it is simply the question of operating cost and maintenance which has prevented the general application of this system. It is universally recognized that evenly diffused light makes sculpture appear flat and uninteresting and for the same reason that directed light is best for works of art, it is required for the easy vision of objects of three dimensions in factories.

Summarizing the factors which influence the selection of lighting equipment, we have efficiency, based upon horizontal and vertical illumination; favorable appearance of the lighted room; direct and reflected glare; shadows; and maintenance. In Table II, 20 different lighting units are compared according to these seven qualities. The choice of equipment depends largely upon the character of the place to be lighted. For instance, in a foundry where the question of maintenance is of prime importance a unit should be chosen which rates high in this respect.

The permanence of a porcelain enamel steel surface, even under unfavorable atmospheric conditions, its moderate cost, and the ease with which it can be kept clean, have made it the most generally employed among industrial reflectors. In order to conform to the specifications of the Reflector and Lamp Manufacturers' association, reflectors must have a surface of good quality and high reflecting power, the proper angle of cut-off and diameter, and a contour which distributes the light most effectively.

Clear bulb lamps, except with opal caps, should not be used with dome reflectors at mounting heights of less than 20 feet. At this height the nearest lamp within the field of vision is so far removed that ordinarily the amount of light entering the eye directly from it is insufficient to cause glare; also, the lighting unit subtends so small an angle at the working surface that shadows are not greatly softened by frosting the lamp. When suspended at a height of 20 feet or less from the floor the lamps should be bowl-frosted or otherwise rendered diffusing. Contrary to a rather common impression, the bowl-frosting does not affect their life and when used with dome reflectors does not increase the loss from absorption by more than 3 or 4 per cent.

So far as direct glare from units themselves is concerned, bowl-frosting the lamps usually proves sufficient. However, in some cases the resulting brightness of images of the unit on polished working surfaces may be found ex-

Table III

Tests Show Good Lighting Increases Output

	TEST NO. 1	TEST NO. 2	TEST NO. 3	TEST NO. 4
Kind of shop	Iron-pulley finishing shop.	Soft metal bearing machine shop.	Heavy steel machine shop.	Carburetor assembling shop.
Floor area, feet	40 x 80	48 x 50	40 x 58	50 x 80

Percentage of cost to pay-roll	5.5	....	1.2	0.9

Note: *From shop records.

cessive and shadows remain so sharp as to be annoying, inasmuch as nearly one-half of the light received at the work comes directly from the small surfaces of the lamp itself. Where the more exacting visual requirements exist, it is well to use bowl-enameled lamps or to fit them with dense opal diffusing caps. The work of maintenance is somewhat increased when caps are employed, inasmuch as a small amount of dust enters the narrow space sometimes left between the cap and the lamp bulb. The glass itself is smooth and may be readily cleaned.

Where a still further degree of diffusion of light is desired, the reflector cap diffuser unit is recommended. With this equipment, direct glare is avoided by covering the lower part of the bulb with a silver plated cap. This cap hides the filament from the eye and directs the rays of light to the large reflector above. The light is distributed over the entire surface of the reflector so that it is possible to view the unit from any direction without discomfort.

FIG. 5—A REFLECTOR CAP DIFFUSER INSTALLATION IN A MOTOR MANUFACTURING PLANT. IT WILL BE NOTICED THAT THE GLARE IS NOT OBJECTIONABLE AND THAT SHADOWS ARE ALMOST ENTIRELY ELIMINATED

Many engineers are familiar with the data in Table III which show the relation of the cost of good illumination to the value of workmen's time. In fact it often is only necessary to save 30 or 40 seconds in an hour to entirely offset the cost of lighting. To produce an illumination varying from 5 to 10 foot-candles in the different departments of a factory under present conditions requires an expenditure of a little more than 1 watt per square foot of floor space, assuming that well diffused lighting units are to be employed. With current at 2 cents per kilowatt-hour the total cost of lighting should not exceed 7.5 cents per square foot per year for a night shift of 2500 hours.

Humanizing Labor in the Steel Plant

BY PHILLIP STREMMEL

THE world war, through which we have just passed, and the innumerable problems growing out of it, challenge capital as it has never been challenged in all history. The world, in respect to labor, wages, hours of labor, management, etc., is practically chaotic. No one knows what a day may bring forth. We do know, however, that underneath this seething volcano of unrest there are certain unmistakable facts.

Are Conscious of Power

The part labor has played in the great world struggle has rejuvenated her. The working men are not only awake, but they are conscious of exerting a tremendous power. They are also determined that the fruits of the awakening shall not be lost. They look back on the old days and wonder how they could ever have submitted to that regime, and now capital and labor must settle the issues so clearly raised. The issues being joined, we must candidly and intelligently set them forth and abide the arbitrament of reason and the dictates of justice.

How, then, can we humanize the steel industry? And how do our share in solving the fearful problems of world reconstruction?

FIRST: If the steel industry is to be humanized, confidence must be restored between the employer and employe. The whole history of the steel industry has been one of struggle. The employes have believed that their rights could only be secured and maintained by organization. On the other hand the employer fought organization, because he was convinced that it was an invasion of his rights. The truth is, both were partly right and both were partly wrong.

The employer and employe must come to a state of mutual understanding, and in the realization of that fact a great step forward shall have been taken. The employer must not limit his interest in his employe merely to his power to produce. He must also see his family; their educational, social, and spiritual needs must express themselves in the pay roll. The employer must have vision enough to see that he must not think only in terms of profit and production but he must also think in terms of his responsibility to the community growing out of his plant.

So when capital, keeping pace with sociological thought as well as with modern methods and machinery, sets itself to see man as a man as well as a worker the old dissatisfaction and distrust will disappear. The basis of confidence, therefore, is self-respect. Without respect, mutual respect between employer and employe, there can only be struggle to the bitter end, which will ruin both.

Cannot Camouflage Employe

The employer can no longer camouflage the employe. He can no longer get up in large conventions, make speeches about the rights of the laboring man, that labor is not a commodity, that labor has the right to organize, that wages must not be re-

(*Concluded on Page* 1651)

Making Tin Mills More Efficient

Tin Plate Production is Hindered Largely by Lack of Intelligence of Workmen and by Lack of Encouragement on Part of Employers— Improved Equipment Will Aid Production

BY J. K. LAMOREE

PRODUCTION is the most important factor in determining cost of manufacture. Large production will minimize various losses due to faulty practice; small production will neutralize many of the advantages to be gained from other sources.

This is particularly the case in the manufacture of tin plate, where the product is uniform and operations are conducted upon a large scale. The human element, which enters largely into the processes, exerts a powerful effect upon the productivity of the plant. The tendency, however, is toward increased production because most producing labor is paid on a tonnage basis.

Every manufacturer today is facing two problems, each distinct in itself but both inherently dependent one upon the other; namely, the necessity for increased production and the impending scarcity of labor. Exigencies of the reconstruction period demand an increase over normal production. At the same time, the outflux of foreign labor to European countries threatens to curtail normal output. The situation is anomalous in that production must be increased in order to overcome the handicap of decreased labor forces. In other words, more work with less men must be done.

Labor and Production Compared

The labor scarcity, being a mathematical matter of numbers, cannot be manipulated; on the other hand, production, being a variable quantity susceptible to adjustment, growth and development, can be increased through intelligent direction and study. If the problem is to be solved, production must be increased independently of labor numbers, and sufficiently to meet our greater needs plus the deficiency arising from a depleted labor market.

Increasing production by increasing the number of hours in the working day is impracticable. The production of tin plate is a continuous process, one shift beginning where the previous one leaves off. The present shift of eight hours represents an economic division of the day, suitable alike to employer and workman. Even if this were not the case, an increase of the working day would be undesirable from the standpoint of the employer and employe. In one case longer hours means inferior work and decreased efficiency while in the other increased working hours means less time for rest and recreation.

Production may be increased in many ways without increasing the number of labor employed. None of the methods are new, untried or unusual, yet each has possibilities which have not been developed and which are of sufficient merit to deserve attention and study. Briefly stated, production may be increased by increasing the output and the personal efficiency of the workman; by increasing the output and operating efficiency of present machinery; by decreasing the percentage of spoiled product, such as wasters, cobbles, etc., by invention, development and introduction of new machinery; by simplification of manufacturing processes; by better coordination of processes; by increasing the size of machines and equipment; by building larger plants and thus concentrate manufacturing effort; by bonuses, premiums and penalties; and by standardization of sizes.

The output efficiency of the workman is the measure of his ability to get out work, using a given machine in a given time with a given expenditure of human energy. His output efficiency is increased if he can so arrange his work as to increase his output without increasing the expenditure of human energy, the time and machinery remaining constant. Efforts to increase production are conducted most commonly along this line.

The usual method of teaching a man how to roll tin plate is to put him to work at a certain job on a mill and let him find out for himself. The roller, heater, or doubler shows him what to do and he proceeds to learn the knack of the business at a rate directly proportionate to his ability to observe and imitate. He will learn faster if he works with friendly companions, because they will teach him the finer points of the trade. The hot-mill foreman oversees the man's efforts in a general way, criticizes his work if it is not up to the standard and is satisfied if he does not fall down on the job.

This is ostensibly the least efficient manner in which new men can be broken in. From a production standpoint, there are three reasons why this method is undesirable to break in a new man. It makes the learning process hard, discourages men who are not extraordinarily strong and increases labor turnover through men quitting before they have learned the easy way to do the job. The intelligent American is discouraged by the hard work and apparent lack of opportunity. He feels that the return he receives is not worth the drudgery of a long apprenticeship. As a natural result, the husky, unintelligent foreigner falls heir to the job because he thrives on hard work and dull routine, and is attracted by the high wages. The general intelligence of the mill personnel is lowered, which means that greater executive effort is required to secure desired results.

Present Methods Are Undesirable

The second reason why mill apprenticeship is disadvantageous is that the beginner is essentially a poor producer. The longer his training lasts the longer his productivity is below normal. If he gets tired or disgusted and quits, another beginner takes his place and production again starts at the bottom. The "teach yourself" system of developing skilled men makes the apprenticeship period extend to the maximum and is therefore an undesirable method.

The third reason why production suffers through our failure to teach the beginner his job is that the work is not done according to system or to predetermined methods of output efficiency. Each man learns his own way and works his own way, with a considerable resultant difference in efficiency, according to the man. If he does his work a hard way, that is *his* affair; if there is a better way, whereby increased output may result from the easier method, that is the manufacturer's affair.

Hard apprenticeship, low labor intelligence, and lack of incentive are direct hindrances to production and can be improved by a study of the many factors entering into the work and the application of the results of that study to the betterment of the work. The first undertaking and the one most productive of immediate improvement would be the systematic training of beginners. This would be done best by setting aside

The author, J. K. Lamoree, is mechanical engineer at the Shenango works of the American Sheet & Tin Plate Co., New Castle, Pa.

one or two mills as apprentice mills. These would be in charge of workmen who have the ability and inclination to teach others. They would necessarily be men of higher than the average ability, who would study the work with the object of teaching the apprentices to become efficient workmen.

Advantage of Teaching Workmen

This arrangement should develop better workmen and reduce the time required for learning. An atmosphere of helpfulness and co-operation would be created. The intelligent American would find the outlook more encouraging and he would be more ready to enter upon the new work. The objection to this plan will be that we have so many beginners to break in that it would require several mills to take care of them. The principal object, however, is to decrease this large number of beginners. By alleviating the hardship of learning and by putting a premium on intelligence better men will be attracted and the number of beginners will be held to a minimum.

Another feature which enters into the output efficiency of the workmen and receives little consideration in the tin plate industry, is the time and number of movements required in doing the work. No matter how skillful, nor how old in service a man may be, he often consumes more time and goes through more motions than the work actually requires. The newer the man the more liable is this to be the case. An improper sequence of motion often is used, which makes the handling of the material awkward and slows up the process. Any advantage which might accrue from a time and motion study of present processes would be incorporated in the course of training and thus passed on to the new men.

Difference in Mill Crews

In processes, such as hot rolling, where the work involves the combined efforts of a mill crew, the advantage of eliminating lost motion is multiplied because the work of the entire crew is regulated largely by the greatest possible speed of the slowest man. If the speed of the slow man can be increased, the speed of the entire crew is affected proportionately. A brief survey of tin mill practice probably will show the opportunities in this direction. On 30 or 40 hot mills, individual crews seldom produce equivalent tonnages over a given period of time, even though the mills are working on similar specifications. The difference in output in this case is due almost entirely to the difference in the men and the way they do their work. It is reasonable to suppose, therefore, that the efficiency of the poor crew can be increased if the members can be taught to do their work in the same manner as the members of the good crew.

By personal efficiency of the workman is meant the measure of his physical capacity for doing work, and by increasing his personal efficiency in a given time with the same machinery, he can perform more work due to an increased expenditure of energy made possible by better working conditions. A man has a certain capacity for work, a certain fund of energy to give up and if he is working under adverse conditions or is not in good physical condition, the energy which might have gone into production is dissipated in overcoming these retardent elements. The steel industry has been foremost in promoting welfare work among employes. Results have justified the expenditure, judging by the increasing scope of this work and the large expenditures being made yearly.

A Field Fertile for Research Work

STIMULATED production in the tin-plate industry depends in a large measure on study and education. This industry has grown with great strides and engineers now are beginning to realize the large possibilities. The work, which already has been completed, has been enormous and reflects the high caliber of the officials who are steering the industry over its course today. However, additional work remains to be done. Research work on a large scale must be performed. Mechanical laboratories must be established. Machines must be built, tried and scrapped to make room for newer and more efficient units until there is an end to the possibilities in this direction. The workmen must be skillful and have vision and patriotic instinct. They must realize their true relationship to industry and to the nation and be willing to put those industrial ideals into practice.

For years it has been considered unavoidable that production in tin mills during the hot summer months be curtailed and lowered on account of the excessive heat. Due to the use of air blast cooling systems, insulated furnaces, floor fans, water cooled floor plates, ventilated smoke hoods, water cooled furnace shields, etc., conditions have been improved to a point where summer operation can be carried on without exhaustion of the men. At the same time, there are possibilities for considerable further improvement along these lines, provided the matter is made the subject of close and conscientious study.

Welfare Work for the Shop

Whether the comfort of the workman on the mill has been approached sufficiently from the standpoint of dollars and cents profit through increased production still is an open question. Large sums are spent annually on welfare work which aims to reach a man after he is through work. Community gardens, housekeeping centers, visiting nurses, and other devices are given close and scientific attention. Why not extend this staff work to the actual place where the workman spends the greater part of his time?

Here is a good opening for the welfare engineer to show an immediate return through increased production. Tests on cooling system air temperatures and pressures; determination of proper locations of outlets; tests of various systems of cooling, such as pedestal fans, individual blowers, etc.; study of advantages to be gained from various types of water-cooled floor plates and furnace shields; records of humidity, temperatures, air direction, etc., are but a few suggestions along the line of improving the working conditions on the mill and making it possible for men to make maximum production with the minimum expenditure of physical energy. Wherever men must work in extreme temperatures it is possible to increase production by improving working conditions.

How Machine Output is Increased

The output efficiency of a machine may be defined as the measure of its capacity to do certain work within a certain period of time with a given amount of human attention. Anything which can be done to make the machine do more work within the same time, or do the same work within quicker time, or do the same work within the same time with less human attention, increases the output efficiency of that machine. It is almost too palpable to state that production may be increased by speeding up a machine; yet there are many processes in the manufacture of steel products where a study of speeds can be made to advantage, and where present practice is now complacently taken for granted.

For example, the cold rolling of tin plate stock can be materially affected in time by speeding up the rolls or by increasing the diameter of the rolls, or both. The two factors entering into production on a cold mill are the speed with which a man can feed the plates, and the surface speed of the rolls. A

brief study of both factors will determine the limit. Getting additional speed out of the various stands of cold rolls on the day turn and discontinuing the operation of a few mills on night turn often affects both fuel and labor economy. Many machines are operating at speeds which current practice has determined to be satisfactory but which are not the result of study. Each machine must be known to be operating at maximum.

The term operating efficiency is used to denote the service a machine renders while under power. No one source of lessened production is so discouraging nor so readily noticed on the daily reports as loss of time due to disabled machinery. If maximum production is to be secured, careful attention must be given to this item. Every stoppage must be fully investigated and reported. Efficient inspections must be made and breakage anticipated.

Constant Operation Must be Considered

In some cases machines must be slowed down to get greater speed. This is true where high speed results in loss of time through breakdowns which more than balances the advantage accruing from increased machine speed. The element of constant operation enters into and must take precedence over all other items, because production primarily depends upon operation. Continuous operation is not always the result of upkeep and the attention given to the machine. Delays may be due to defects in machine design, as for example, stoppage and losses from cobbles.

Spoiled or imperfect product is a serious cause of low production. Every finished piece which is not prime stock or which is cobbled or spoiled before it comes through the last process, represents loss of time, material and labor. Every improvement which will cut down the percentage of wasters, cobbles, or discards, is a direct increase in production.

Cobbles are due mainly to imperfect machine action and must be remedied by closer attention to the construction, repair and maintenance of the machinery. A little educational work in the shops will be of big help. As a rule, the average machinist, blacksmith, or pipefitter does not realize fully his close connection to the productivity of the plant. This should be impressed upon him in such a manner that he can understand why the spoiled product is a direct function of badly kept machines. The manufacture of imperfect and indifferent product is generally due more to careless operation than to any defect in the machinery. Sometimes it is both, as in the case of a tin house foreman who runs a machine having worn out rolls or a hot mill foreman who tolerates scaled plates due to a faulty furnace damper. Wasters and seconds are analogous to a pain in the human body; they indicate imperfect functioning at some point or other in the plant. If we remove the cause, the pain will disappear.

Causes for Waster Sheets

Investigation will show that most wasters are caused through poor and careless workmanship. Education is the only remedy for this. Employes must be taught to realize the importance of every operation in relation to the finished product. They must know something about the plant as a whole and they must be interested in the business. Education, through plant magazines, lectures, meetings, posters, etc., is the road to loyalty and knowledge. Without knowledge the workmen will never realize their highest relationship to the plant and without loyalty the officials will never realize the greatest possibilities of the workmen.

The invention, development and introduction of new machinery is considered the true road to industrial advancement. The introduction of new labor-saving machinery in our mills not only will increase production, but also will release labor to handle work which cannot be done by machinery. The number of processes in our mills today, which are considered hand work, but which are adaptable to the use of machinery, is remarkable. There is not a single process in the manufacture of tin plate that the product is not handled by hand and often crudely. It takes nine men to heat the bar and hot roll it. These nine men principally are engaged in moving the packs of sheets from the furnace to the rolls and back again. Two men on the crew, the roller and the heater, are required to exercise judgment; the rest of the crew are paid high wages to do work that can be done by machinery.

Room for Improvements

The shearing of the plates after hot rolling can be improved. Opening the pack is done by hand and requires one or more men to every hot mill. It requires no exercise of judgment, except the elimination of stickers. Pickling requires large numbers of men due to the fact that no attempt has been made to replace the present intermittent method by a continuous process. No skill is necessary which cannot be transferred to a machine intelligently supervised. Annealing and cold rolling also present possibilities in labor saving machinery. Feeding and stocking on the cold rolls, now done by hand, are easily adaptable, with a little study, to machinery. In the tin house and shipping department much labor is expended which can be eliminated after a thorough study of conditions.

Men who have made a study of tin plate manufacture realize that the industry is a fertile field for the designer and inventor. To a man who wishes to embark upon work which offers great opportunities to the thinker, to the analyst and the engineer, the steel business holds no greater opportunity.

Simplification of manufacturing processes refers to the reduction of processes, the elimination of unnecessary parts of processes and the rearrangement and replacement of steps in manufacture which are now the result of natural growth rather than analytical study. For example, we are accustomed to consider hot rolling, shearing, opening, pickling and annealing as the necessary and natural succession of processes in the making of tin plate. Suppose it were determined, by experiment and study, that shearing could be eliminated at this stage, the packs being opened, pickled, and annealed before shearing. The shearing would then be done in connection with cold rolling with a possible advantage to be secured from better annealing and less labor in pickling. Or again, suppose a continuous pickling machine were devised, into which the sheets would be fed directly from the opening benches. This would simplify the pickling operation.

Is Room for Better Co-ordination

These instances are not given as feasible, workable schemes, but hold out sufficient promise to warrant using them as examples. There is no reason why the present processes are to continue indefinitely without change. As the industry progresses, the elements of manufacture will become more simple. This simplicity can be hastened by making it the object of direct purposeful inquiry.

By better co-ordination of processes is meant a personal co-ordination of departments and of those in charge of processes. Closer effort and a system of interdepartment staff action will straighten out many difficulties which lack smoothness and result in the loss of production through misunderstandings. Co-ordination of the processes in themselves suggests careful routing analyses and the appointment of a staff officer whose principal duty is the determination of precedence and the proper movement of orders. This in turn can be carried out successfully only when the mill organization realizes the function of this man as a production booster and gives him full support.

Size of machinery and equipment is a well known factor in figuring produc-

tion per unit of labor employed. Yet it is doubtful whether engineers and executives in the tin plate industry have given this matter explicit and sustained study with the definite aim of increasing production through this means. Hot rolling is a good example of a field for such study. In making an order of sheets of a certain size it is customary to figure the pack as it is rolled to give two, three, or four sheets of the finished size. In other words, the pack is rolled two, three, or four times as long as the finished sheet and then sheared to the proper size afterwards. The width of the sheet is taken care of by rolling on certain size mills. Considerable ingenunity can be exercised in laying out the orders for the mills and, as a matter of fact, the hot mill superintendent invariably rolls the sheet the widest way possible in order to get the maximum number of finished sheets.

The limiting factor in the number of cuts which can be secured is the weight and size of the pack. A man cannot handle sizes and weights beyond certain limits. Often it is a matter of a few pounds or a few inches but if the man is not capable of handling the larger size pack, it must be reduced, placed on another mill or changed around. The greater the number of cuts that can be secured from a pack, the greater is the production per unit of labor.

Handling Heavy Packs

Large and heavy packs can be handled if mechanical lifts, tables, and guides are devised which will take the weight off the roller's hands and make it possible for him to manipulate them. With these mechanical helps it would be possible to enlarge the mills, eliminating the smaller mills entirely and increase the average all the way through. This is where a study of sizes will result in more productive practice.

The building of larger plants is, of course, a matter of growth and executive policy. However, the advantages of the use of big power units, cranes and conveyors, byproduct installations, convenient routing facilities, etc., are noticeable, especially in plants which are growing, and points to larger plants as the road to higher plant efficiency. In this connection it may be stated that only in larger plants is it profitable to maintain a resident engineering force of sufficient size to accomplish anything outside of mere plant operation. The resident engineer can be a decidedly important factor in the development of new ideas because he is close to the work at hand and can see what is needed. Larger plants mean department heads and executives of bigger viewpoints, which opens the way for the staff organization which must be part of any large scale improvement program.

Bonuses, premiums and penalties are mooted questions and in the final analysis are within the function of the higher executives only. There is the question, however, of nonfinancial incentives which invites consideration. The personal efficiency of the workman can be affected greatly by his mental attitude toward the work and it is true that any improvement in general operating conditions can be attained only by bringing the minds of the men up to the level of the line of vision which the executive has when he lays out the plans.

In tin mill practice the hot mill crew must necessarily be the unit for any comparison as to personal efficiency. This is due to the fact that each man on the crew has a definite effect upon the quality and quantity of the output; at the same time the combined work of the crew must enter into the product to give a unit of production upon which to base comparisons. It is therefore evident that any improvement in operation must be secured through stimulation of the crew as a unit, relying in turn upon the roller, as the foreman of the crew, to stimulate each member to better and more careful work.

The tendency in mill management has been to reduce the roller from a position of responsible head of the crew to one of nominal responsibility. The actual responsibility has come more and more into the hands of the hot mill superintendent and his hot mill foremen. This largely has been due to the gradual enlargement of the plants and the necessity for greater centralization in control. At the same time it has destroyed, to a great extent, the feeling of personal responsibility of the roller, who, in the final analysis is the man who can do most toward increasing production.

Interest can be created among the rollers by letting them know more about what the mill is doing. There are a number of ways of doing this, all of which woudl have for purposes, the development of friendly competition in production, pride in quality of product and interest in general operation. The first and most effective procedure would be the publication, either by bulletin or weekly confidential letters, of the output of each turn on each mill. The roller's name and the size of the mill should appear on the record. The names should appear in order, according to amount of output. Mills of the same size can be grouped together to secure fair comparisons.

How Interest May be Created

Different methods can be used to call attention to good work. Printing the first and last names in colors is often effective. Classifying men over a certain minimum as "good rollers" should arouse desire to improve. One advantage to the manager is that this procedure enables him to keep a line on the efficient workers and pick out the weak ones. A man who is habitually in last place should be investigated and the cause of the trouble ascertained. It might be due to a poor crew, bad machinery or poor ability on the part of the roller himself.

A curve or graphic chart showing the output of each crew can be posted in a glass case at each mill. This curve would be lengthened each week, enabling the men to see graphically just how their efficiency varies. The hot mill superintendent would, of course, see that each crew kept its curve on an upward trend. Weighing shear scrap should be carried out rigorously, with penalties for scrap losses over a certain maximum. These penalties can be in the way of publishing mills which are inefficient, although in this case, financial penalties would be probably more effective.

Competition can be stimulated by having signs or placards framed, to be hung up at the mills having best and poorest production for the week. These signs could read: "This mill highest output for past week," or "This mill lowest output for the past week." The sign would be changed each week to the mills having the record for the

Pay Envelope Might be Heavier

FINANCIAL rewards do not always result in increased production. The fact that tin mill workers largely are paid on a tonnage basis, whereby an operator's pay automatically increases as his output enlarges, brings this to light rather forcibly. In few cases do the workmen strive to increase tonnage for the sole purpose of increasing their pay. The tendency is to strike a gait which will give a fair rate of remuneration and get along as easily as possible without lowering the level. An increase in wages often results in a decreased output, the workmen preferring to ease up on their tasks rather than profit by the increment in wages from higher tonnage rates. The obvious recourse is to stimulate production methods which include other than remuneration incentives. Plans along this line depend upon the heads of the departments and are explained elsewhere in this article.

week. Printing the "low output" sign on yellow paper might make it more undesirable as an ornament.

To give gifts for excellent performance of duty is generally considered poor practice; yet, a box of cigars distributed each week to the mill having the highest output for the week will result in increased effort all down the line. The principal object of any of the foregoing suggestions is to stimulate local pride and emulation among the crews. In any event, the roller should be recognized and all the effort be directed to the end of securing his help and cooperation.

Any work of this kind means an addition to the clerical force of the mill. Part or all of one man's time should be given to the job. It is a mistake to add this work to the load of some already overburdened clerk. Records must be published promptly and accurately, tabulation must be made and the data placed before the operating heads who can follow up the poor workers. It is impossible to arouse interest if records are not accurate or if publication is delayed; neither will any permanent good result unless the poor workers are investigated and eventually stimulated to improvement or put back into less important positions.

The standardization of sizes must be necessarily a matter of almost international moment. It is possible that labor conditions will eventually reach such stage that it will be cheaper to make a few standard sizes of tin plate and let the customer come to those sizes. That time is evidently not the present. However, the increased efficiency which will result from even a partial elimination of odd and unusual sizes certainly warrants the consideration of this factor. A study of the needs and requirements of the nation, with the view of establishing a code of permissible size variations, would be within the functions of one of the national engineering societies. Labor wastage through handling of orders for an infinite range of sizes is great and at least offers a field for investigation.

Plant Accidents Reduced by Safety Work

An instance of extraordinary accomplishment in accident prevention work has just come to the attention of the National Safety council. In the plant of one of its members, the American Rolling Mill Co., Middleton, O., a reduction of 46 per cent in the total number of lost-time accidents, 51 per cent in the total number of days lost by workmen as a result of accidents, and 91.9 per cent in the total compensation paid by the company is shown for the past five months of 1919, compared with the same period in 1918. In this plant, employing 3500 workmen, there were 83 accidents during the first five months of 1919, as compared with 210 in the same period last year. Injured workmen lost 868 days during the first five months of 1919, compared with 2523 last year. The total outlay for compensation of accidents in May, 1919, was but $1.71.

German Trade Outstrips that of British

A recent issue of the monthly journal of the Sheffield chamber of commerce contains articles expressing concern in regard to the enterprise of Germany and its menace to the trade of the British steel city. One writer says:

"The past month was one of the most hopeful—for Germany. How could her game have been played better than by those who, whatever their intention, succeeded in plunging British industry into confusion? We may shortly be faced with the necessity of fighting for a bare existence in the markets of the world. A pretty fine league of nations is likely to be built upon a lath and plaster foundation of that sort, and when the Germans ask for admittance to it they probably will do so with their tongues in their cheeks.

"As a matter of fact Germany is recovering, industrially and commercially, at a more rapid rate than we are and nothing is so calculated to urge her forward as the chaotic state of British trade. What did the British cutlery mission discover in their recent flying trip across the Rhine? That at Solingen there were quantities of finished goods packed up ready to be dispatched to the rich markets of South America and to countries where labels and descriptions printed in English are easily read. The mission also found that the German manufacturer had forgotten none of the prewar tricks he considered worth remembering, among the number being that notorious legend, 'Warranted Sheffield Steel.'"

"By every test that can be applied," says another writer, "we ought to export more steel than any other three or four nations put together. But the Germans beat us. Between 1900 and 1913 their exports of iron and steel increased from less than 1,000,000 tons a year to over 6,000,000 tons, while ours only increased from 3,500,000 to 5,000,000 tons, and even that comparatively small increase in our case was very nearly offset by importations of steel, which ought to have been produced at home.

"On the eve of the war Germany was producing pig iron at the rate of 19,000,000 tons a year, against our 9,000,000 tons; steel at the rate of 17,000,000 tons, against our 7,000,000 tons; and she was actually exporting at the rate of 7,000,000 tons a year, against our 5,000,000 tons. But for the war the Germans would soon have pretty nearly wiped us out of the business. And it is Germany's set intention to renew her old policy if she is permitted.

"Against fair competition there can be no complaint. If Germany can produce cheaper than we can we must either improve our methods or accept the situation. But German dumping is not the result of superior productive powers, or superior competitive resources. It is the outcome of the fiercest and most highly organized and subsidized economic war, conducted by 'blackleg' methods, the world has ever seen."

Book Review

Applied Science for Metal Workers, by W. H. Dooley; cloth; 479 pages, 5 x 7¼ inches; published by the Roland Press Co. and furnished by THE IRON TRADE REVIEW for $2.

The author, who is in charge of the navy yard instruction school for the New York board of education, has prepared this volume for use in technical, industrial, apprentice and continuation schools and for science classes in secondary schools. The work is in the form of a text book with numerous questions at the end of each chapter. The subjects treated apply to physics, chemistry, etc., and are arranged to teach the fundamental principles of science in such a way that the student or apprentice will understand in an intelligent manner the actual work as prosecuted in the shop under actual working conditions. Numerous illustrations are included to make the subject matter as clear as possible.

The chief purpose of the book is to teach the student the principles of industrial science in a practical rather than in an abstract way. Thus, after he has completed his education, the student will be able to grasp the principles of science in actual operation as he views them in everyday life. The book is written in clear, convincing language wherein theory is discarded as much as possible. As a text book for the student, it will prove of material aid.

Coordinating Shop Management

Basic Principles of System for Obtaining Maximum Efficiency in Operations Outlined—Balancing of Production, Division of Functional Departments and Systematizing of Control Explained

BY M. H. POTTER

CERTAIN requirements are necessary to establish and maintain efficient, progressive plant management, and it should be the first duty of the manager to secure fundamental authority from those in supreme command of the enterprise prior to planning for action. These requirements are shown in Fig. 1, together with the results that may be obtained, or at least are to be aimed at.

Many able executives, when taking hold of a new task, have neglected to secure the backing of the leaders in the enterprise. This has often resulted in difficulties, due to failure to keep promises made to the workmen, through the unwillingness of those "higher up" to stand back of the policies established by the plant manager.

Must Adhere to Policy

Plant managers who have been successful in securing the desired results in one particular line of work, also have been informed that other lines, not before mentioned, must be manufactured. Many similar instances might be mentioned, but the outcome is generally identical. The plant manager proves unable to cope with the situation to the satisfaction of the higher officials.

In dealing with the plant organization, as regards its direct control and supervision, the plant manager and his assistants should personally handle the work outlined in Fig. 2, and through the co-operation of the various foremen should handle the duties as listed in Fig. 3.

As to which are the more important requirements, the organization and the product manufactured must determine. However, too much stress cannot be laid upon the importance of planning, and separating the planning from the action. These are basic, important functions and should in turn be considered from a viewpoint of practical application, thoroughly analyzed and definitely decided on in detail before proceeding.

The balancing of production is another subject for earnest consideration, especially in plants not especially designed for the particular work in hand. The efficient handling of materials and work between operations is important and should receive due consideration from the start. If it does not, the chances are that the most economical arrangement will never be secured. Once a plant starts production, the equipment is seldom rearranged.

Every detail entering into the balancing of production should be considered prior to actual procedure, if economical results are desired. The usual method of studying a plan of the floor space available and the placing of machinery and equipment, on the drawing according to scale, is convenient and practical. However, the many other details which enter into the efficient, economical balancing of production should not be overlooked, as indicated in Fig. 4.

By reference to Fig. 5 it will be seen that the aim in standardizing routine duties is to permit of concentrated thought and effort to meet emergencies.

Fig. 6 further emphasizes the need of careful planning. Elementary as they may appear, the requirements as charted are well worth study. The determination of the most important requirements and their practical application is essential.

Establishing Functional Departments

The division of the organization into functional departments, as shown in Fig. 7, should next be considered. The actual accomplishment of this is not difficult. The fault has not been in neglecting, to make a theoretical division, but in failing to put theory into practice and to make efforts conform to the division. Close ad-

This is the third article of a series on industrial management written by the author, M. H. Potter, for THE IRON TRADE REVIEW.

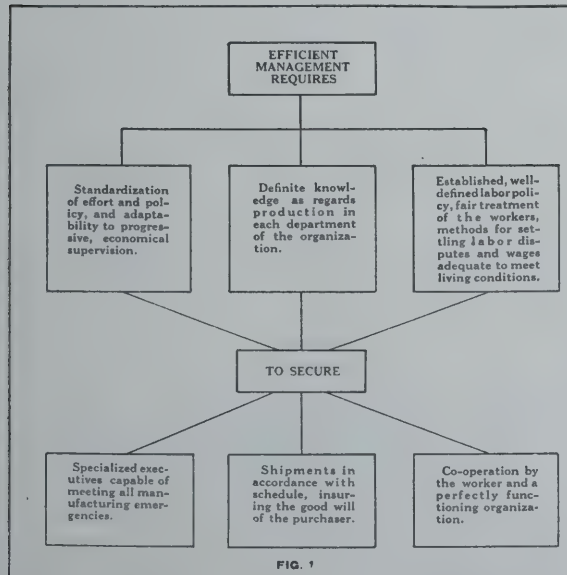

FIG. 1

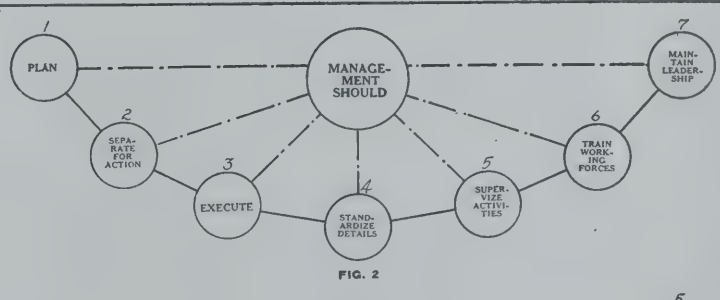

FIG. 2

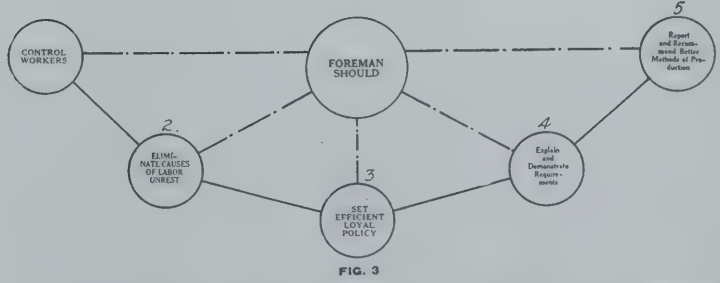

FIG. 3

REQUIREMENTS AND DUTIES OF EFFICIENT MANAGEMENT

herence should be maintained if systematic control is to be successfully attained. The systematizing of control, as illustrated in Fig. 8, is another most important requirement in maintaining operating efficiency. The advantage

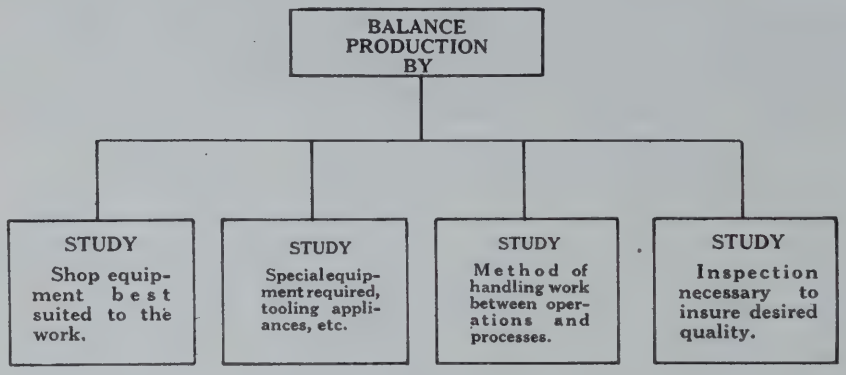

FIG. 4

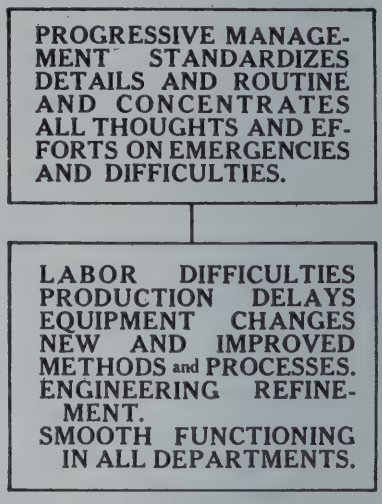

FIG. 5

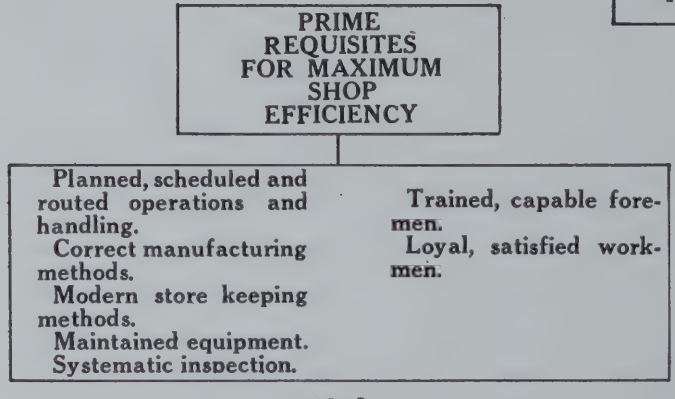

FIG. 6

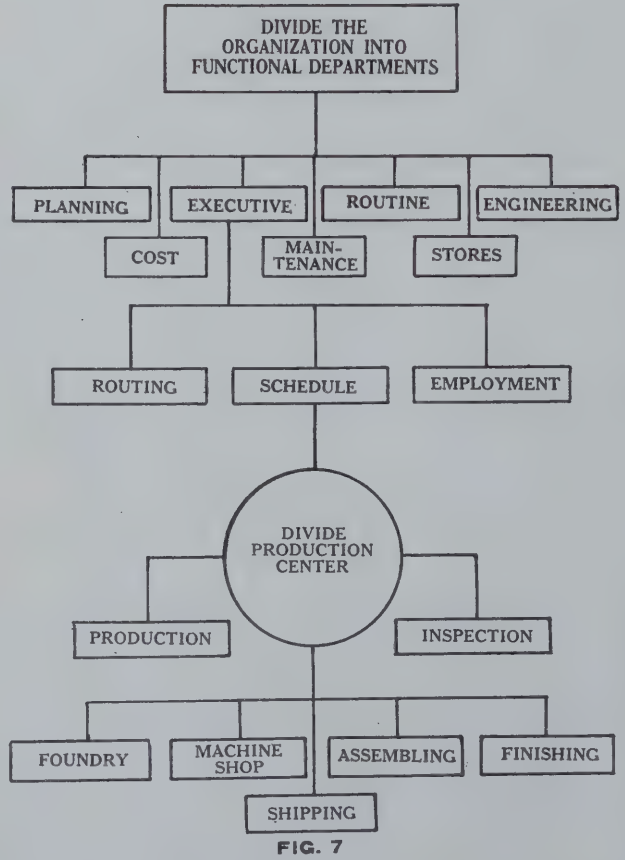

FIG. 7

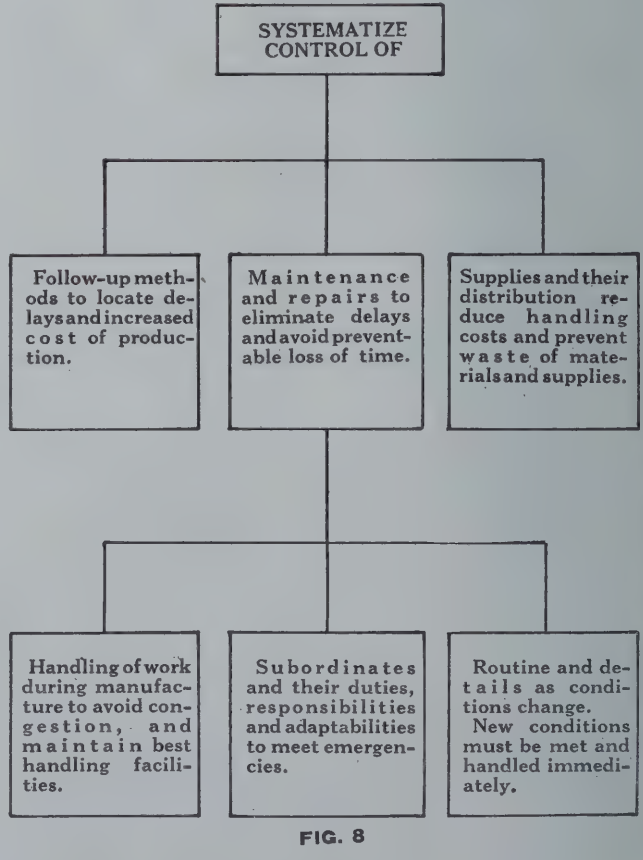

FIG. 8

DIVISION OF FUNCTIONAL DEPARTMENTS AND THE BALANCING OF PRODUCTION

gained is the elimination of delays and causes of inefficiency. This should be sufficient reason for thought and analyses.

Subdividing Functional Departments

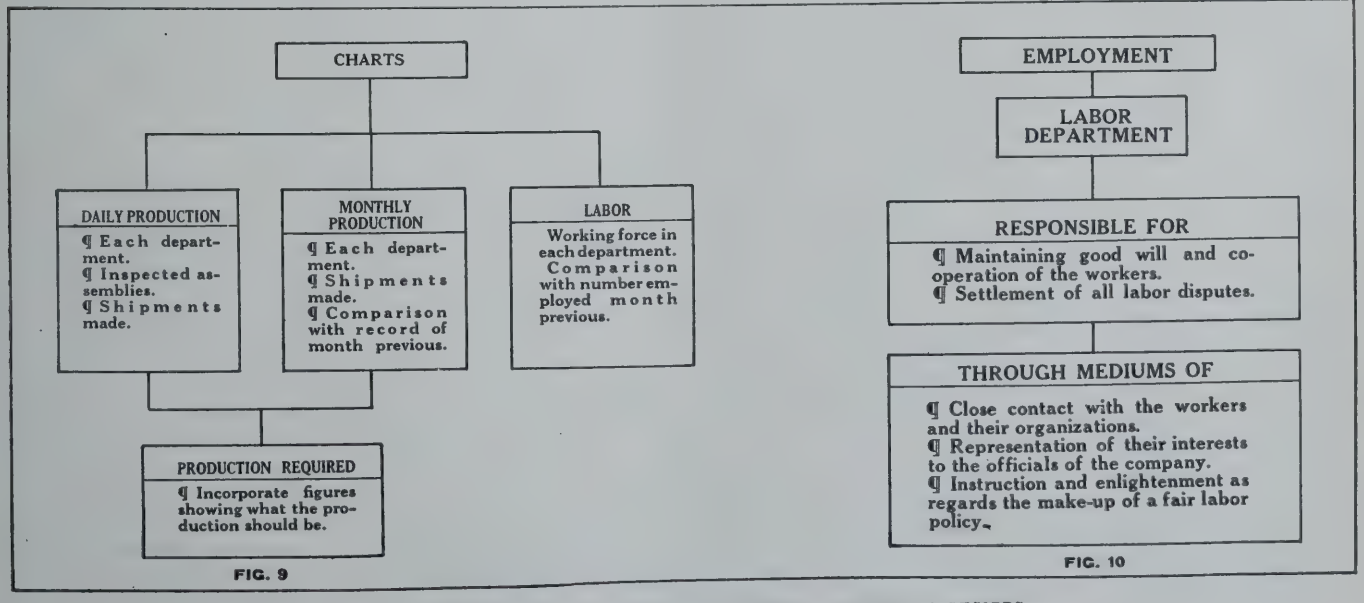
Fig. 10 illustrates a practical system for recording production progress, to make all figures and facts available for ready reference. It is self evident that the best arrangement is that which enables the executives readily to determine not only what the actual production is, but also what it should be. If the problem of charting production progress is attacked in a practical way and if consideration is given to the facts needed, much will be accomplished to overcome delays and to eliminate production troubles. Efficient management demands quick, correct methods.

To further illustrate the advantages of and the reasons for the division of functional departments, Fig. 10 has been prepared. It is an example of subdivision, and covers but one subdivision of the employment department, namely, the labor department. In like manner every functional department should be analyzed and definitely subdivided. Action along the lines of a definite program, through predetermined functional departments and their subdivisions, greatly will lessen delays and troubles. The prevention, not the overcoming of delays, should be the first aim of the plant manager. Therefore, it is advantageous to plan and shape the entire organization in accordance with definite methods and system. If the organization is adapted to the work there is every reason to expect that it will so handle and control the situation that marked success will result.

Management when practiced along these lines has a far-reaching control, not only over the production problem but also the industrial situation. If managers will practice these principles labor troubles will be reduced to a minimum.

Most executives are quick to adopt cost-cutting equipment and means for securing more economical operations, but when the subject of basic organization principles is broached it some times does not suggest action. This is due, no doubt, to the fact that making changes would entail time and expense. However, this should not interfere with analyzing one feature of the system as outlined. For example, if the executive will study the charts and determine which one can be applied to the greatest extent in his organization and then formulate plans in this direction, place them in effect and follow up the program he can check closely the results.

Consider One Principle at Time



With the possible exception of a newly formed organization, there is nothing to be gained by attempting to formulate and place in effect new methods and systems throughout the entire organization at one time. This is especially true where the basic principles of reorganization are involved. It is through the successful accomplishment of one method with its connected details that maximum results are secured. This is not only true in action but likewise in planning. Here again, the executive must realize the great need of taking up and considering one basic principle of efficient management at one time. Of course, a broadminded viewpoint must be taken and the basic principle under consideration must be studied as it pertains to the organization as a whole. The main difficulty is in segregating and classifying subdivisions and their many elements. Interpret these basic principles in definite, concrete terms and their correct application becomes a matter of control and discipline.

Graphite Sales Increase

Sales of domestic crystalline graphite in 1918 were larger than ever before recorded, according to a bulletin issued by the United States geological survey on the production of graphite during 1918. Total shipments of crystalline graphite, including both flake and dust, amounted to 12,861,839 pounds, valued at $1,454,799, and as mine stocks were approximately the same at the beginning and end of the year, this represents the mine production. The sales show an increase of 22 per cent by weight and 33 per cent by value over those of 1917.

Estimates furnished the survey by producers, show that out of total sales of 12,861,839 pounds, 9,811,046 pounds valued at $1,364,600, or 76 per cent by weight and 94 per cent by value of the total was flake graphite for the most part suitable for crucible use. The remainder, 3,050,793 pounds, valued at $90,199, was dust or low grade flake, averaging less than 50 per cent of graphitic carbon.

The greater part of the domestic crystalline graphite output was produced in Alabama, New York and Pennsylvania. Graphite also was produced in Montana, California and Texas. The number of mines reporting sales was 26 in Alabama, one in California, one in Montana, three in New York, six in Pennsylvania and two in Texas.

EMPLOYMENT DIVISION, AND FORMS FOR KEEPING PRODUCTION RECORDS

Specializing in Efficient Buying

Separate Department With Trained Men in Charge Considered Just as Necessary to Successful Conduct of Business as Sales, Auditing or Other Departments—Requisites of an Able Executive

BY ROBERT N. LADD

THERE is an old adage to the effect that goods bought right are half sold, but the force of the argument has not with but few exceptions reached the heart of the modern American manufacturing industry. It has been proved that this adage is a foundation truth as applied to business consisting exclusively of buying and selling. Does it not also apply to the relation between raw material bought by the manufacturer and the products sold by him? The answer is obvious. One might safely say that it applies to the first shovelful of dirt excavated in the process of building the manufacturing plant and from then on step by step to the time of the delivery of the finished products to the consumer.

Too much has been said of sales departments, and other departments have been for the most part relegated to the background, or, to say the least, have been considered of secondary importance. Just as much good reading matter could be written regarding the other branches of industrial organization, and just as many helpful courses of instruction could be instituted relating to these branches, as has been shown to some extent in the matter of accounting, as dealt with in recent years by the various schools of accounting. An idea at one time prevalent was that a firm that found itself unable to tell why it was not making money could hire a bookkeeper at a minimum salary, and that he could tell from his meager knowledge and experience. In recent years this idea has been found to be wrong. Why should we adhere to the old ideas about the buying branch of industrial organization?

No one department of an industrial enterprise makes the success of that enterprise; it is the combination of them all, working together on an equal plane of efficiency for the ultimate result, that brings success. Failure of any department to function properly may ruin the business. In order to accomplish the aim of making capital earn money, what is more important than to start operations by buying right? Why not spend that portion of the capital which has been voted by the directors for the purpose of buying raw materials, machinery, buildings or equipment in the most efficient manner possible? To do this requires a purchasing organization carefully selected and supervised by a trained executive. This fact is often disregarded.

Executive is Needed

The prevailing opinion among many manufacturers seems to be that the proper thing to do with the buying end of the business is to delegate to the job someone in the organization who has the time to spare and who has sufficient ability to take care of the details of placing orders, keeping records, etc., and that when it becomes necessary to buy raw materials involving contracts, the secretary of the company, the sales manager or the chief engineer can take care of it. This method, of course, is wrong for the reason that it is placing the responsibility in the wrong place, making a nonenity of the purchasing agent which is both disastrous to the purchasing agent from the standpoint of his relations with salesmen and to proper buying. It places a responsibility on the shoulders of an official who should concentrate on work that properly belongs to him. In addition to these facts, it is contrary to proper rules of organization as applied to business. One of the secrets of proper organization is placing the work and the responsibility for it where it belongs. If a shop superintendent wants a tool forged he does not take his plans to the head bookkeeper. Just so with the buying; why take it to the secretary or the sales manager?

To appoint the president's nephew purchasing agent, as a matter of general practice, regardless of his ability to fill the position, is a thing of the past. Also among the discarded possibilities are those not specially trained for the work, and last but not least, all the grafters.

The manufacturer in selecting a man to fill the position of superintendent of one of the departments chooses the best trained man, preferably one familiar with the methods employed by other manufacturers. The type of man he selects will directly effect his ability to sell his article, will effect its cost, and the margin between cost and selling price. Why is it that the average manufacturer does not employ the same methods in selecting a purchasing agent? Choose a man from among those trained by actual contact with factory storekeeping, sales, traffic and purchasing. Select a man with mechanical ability, with at least some technical training or shop experience, an executive by character as well as by training, one given to the study of economics as applied to business, one who has an understanding of the laws of supply and demand and one who can, through experience, foresight and common sense, buy to save the manufacturer money. Quality, service and price must be properly considered in their relationship to the particular purchase in hand.

Select a man who can figure, when he buys six months' supply to save a few cents per pound, whether he is actually saving an amount over and above the bank's interest on the same amount for the same period. A man who will give due consideration to the proper distribution of his employer's capital, determining whether it is a heavy payroll period or heavy selling period, if the company is using all its capital at present or if it has a surplus that could be rightly diverted to the buying of stock to be used in the manufacture of some commodity for which arrangements are being made in the way of an intensive selling program.

I have simply mentioned a few of the many features most essential. Other characteristics, such as diplomacy and tact are needed in dealing with the other department heads, as well as a certain regard for co-operation with the engineering department and the work's manager or superintendent. Also an important matter is to have on record any data that might be of money-saving value to the firm.

To some manufacturers it has never occurred how or why these matters should be considered as effecting their balance sheet, but to the man who has in mind the ultimate result that

---

Robert N. Ladd, the author of this article, is assistant purchasing agent of the United States Metals Refining Co., Chrome, N. J.

his employer desires to attain, it cannot but occur how important they are and that the proper regard for such facts comprises one of the elements necessary to a successful business.

It is important to start right by buying right. It is of equal importance to see that the stores department handles its records of stock and disbursements just as cash funds are handled by the cashier's department. This is another feature that is generally regarded as a matter of little importance. Both the buying and storekeeping, if improperly conducted eventually will ruin a business. Any one department of a business that is allowed to drift along under improper management will act as a dragging influence as well as a leak in the bank account and profits. Successful co-ordination of departments, properly led and manned, combined with a proper respect for true business policies, always will win.

Humanizing Labor in the Steel Plant

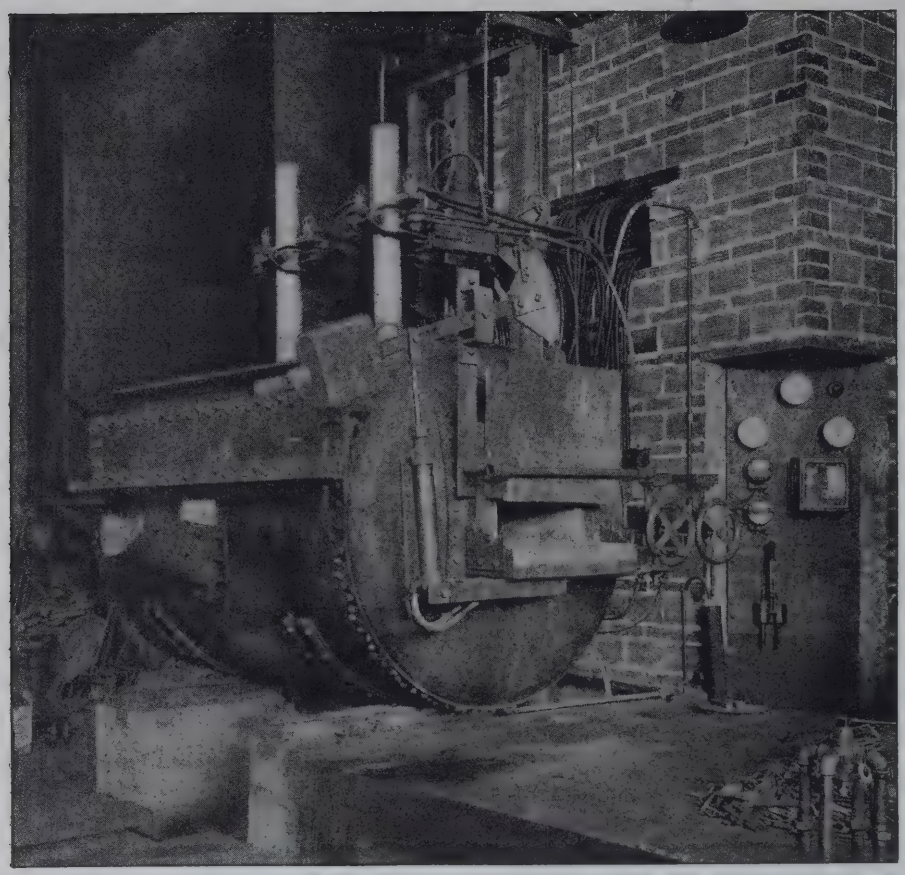
(*Concluded from Page* 1641)

duced, that there must be a fair system of collective bargaining, that there shall be no baron and serf, then return to his plant and permit the very thing to come to pass that he had spoken against and received much praise and publicity about.

But if we respect the employe's rights, concede that many of his demands are incontrovertibly just, he, in turn, will come to respect us and the basis of confidence becomes an established fact. No enterprise, however great or strong or essential, can abide the troublesome days ahead, that does not seek to build upon the foundation of fundamental social needs. This matter of self-respect involves the freedom to think and to act on one's conviction. The employer cannot have the confidence of his employes if he discharges men because they believe in organization or belong to a radical political party. We have condemned wanton acts of destruction and did not realize that the employer's methods of repression, lack of fair play, had much to do in making their employes the prey of conscienceless agitators. In the new order of justice, there will be no place for the agitator who doubtlessly has prejudiced labor's cause on many a field of battle.

SECOND: If the steel industry is to be humanized there must also be cooperation between the employer and employe. The employer and the employe have certain definite interests in common, and the one lesson that all concerned must learn is co-operation. It means success anywhere. It must always be remembered that the steel plant is only a cog in this great progressive movement, and that our work must be viewed, therefore, from the standpoint of the world. Co-operation then would mean a united effort in attempting a solution of our present difficulties as well as the matter of increasing efficiency and production. If jealousy, suspicion, distrust, covetousness, are permitted to fatten in the minds of the employes, what can the employer expect but war? It will be war, day in and day out, as long as men are moved by such motives. Production will be curtailed; the men will grumble; the atmosphere will become anarchistic, and in the end both capital and labor must pay the cost.

In the third place, the steel industry must be humanized to save itself from industrial revolution. The old days are gone, and it is no longer a question of returning to prewar conditions, which is unthinkable; but it is a question of working out the demands, the ideals of labor, in an orderly process. It is either evolution or revolution; strikes, lockouts, will seem small matters as we face the deadly struggle of capital and labor growing out of the world upheaval.



Labor is organized, and is organizing more intensely and determinedly every day. Workmen mean to maintain the new standards of living and they will work out the pressing, if not distressing problems peaceably if properly approached, and in time. They have had to fight every inch of the way, and the laboring man, the world over, is in a fighting mood today and means to win. Labor, then, must be approached in the spirit of the times. Capital will simply invite destruction if it attempts to maintain the old order. We must see the world as it now is and deal with the new conditions in a spirit of justice and of utter unselfishness.

This does not mean that every demand made by labor can be granted, but it does mean that in the granting of some of their demands that we propose thoroughly to face the issues, exhibiting a spirit of fairness, of willingness to do all that is within our power to give labor its due and also keep our business upon a paying basis. Our profits may not be so large as formerly, but the confidence, the harmony, shall have made our investment trebly secure, because out of the readjustment will come not only respect, but love for law and order. There is no other way that is so full of promise; and in view of the unprecedented economic upheavals shall we not follow the path that leads to peace and security?

FOURTH: The steel industry must be humanized, so that we may play our part in the world reconstruction. Its humanization not only affects America but it also affects the welfare of the world. Chaos must not only be defeated in America, it must be defeated, driven back, conquered, the world over. We must demonstrate a patriotism of the highest order, and as we work out the complex problems immediately confronting us at home, we shall be able to rally the moral influence of the greatest democracy in the world against these socialistic, anarchistic, and Bolshevistic tendencies anywhere they may be found. The steel industry, therefore, must work out its immediate problems at home and the very realization of that task will be like the pouring of oil upon the troubled waters of the world's discontent.

We know now that we can no longer disregard labor, labor conditions, or labor's thought or place in any part of the world. A victory for ultraradicalism in Europe means an ultraradical struggle in our own land. Defeat abroad only deepens the gulf between rich and poor at home. Labor's tremendous, yes, unprecedented influence in England thrills the American Federation of Labor to the heart, and new plans, new demands, and a definite policy of action is born. The world is one. What England thinks affects America. What France, Italy, or Japan does or fails to do is felt in our thought and life; wages, hours of labor, management, these are international terms and influences. It must, therefore, be plainly seen that if we find the way leading toward a solution we not only contribute to the social wholeness of our own land, but we are projecting influences which will affect the labor program of Europe, of Asia, of the world.

A new gas-producer plant was placed in operation recently at the works of the Page Steel and Wire Co., Monessen, Pa. The plant includes three mechanical producers built by the Morgan Construction Co., Worcester, Mass., together with coal-crushing and conveying equipment. The fuel gases will be used for open-hearth melting purposes. The furnaces formerly were fired with artificial gas and, consequently, to use producer gas it was necessary to install new port and valve equipment. The latter was built by the Blair Engineering Co., Pittsburgh.

TWO-TON, 500-KILOWATT, ROLLING CYLINDER TYPE ELECTRIC FURNACE INSTALLED IN SEATTLE PLANT

Install Electric Furnaces on Pacific Coast

Three installations of electric arc furnaces recently made in foundries in the state of Washington embody a number of novel features, each of which was demanded by the conditions obtaining in the plant. The unit shown in the accompanying illustration, which is employed by the Vulcan Mfg. Co., Seattle, has a capacity of two tons and is rated at 500 kilowatts. It is of the rolling cylinder type and the charging door is in the end, an arrangement which permits the furnace to set close to the transformer room, therefore occupying an unusually small amount of floor space. The tilting of the furnace is controlled by a 4-way hydraulic valve, shown at the right, which is said to be quick, direct acting and of simple operation. The furnace shell is provided with a dial and pointer to indicate the degree of tilting. This assists the operator in bringing the furnace back to its normal vertical position without shock.

A 500-kilowatt, 2-ton, rolling-cylinder type furnace recently was installed at the plant of the Lamb Machine Co., Hoquiam, Wash. The charging door of this unit is in the cylindrical wall of the shell opposite the spout. The furnace foundation is sufficiently elevated above the main floor of the foundry so that workmen may carry hand ladles away from the furnace without stooping over to pick them up. The ladles are supported by a ladle hanger while the metal is being tapped and workmen therefore may remain at a safe distance until the furnace is rotated to its normal position. When the metal is tapped into crane ladles, the shank ladle hanger is quickly removed. As in the case of the furnace at the plant of the Vulcan Mfg. Co., the tilting is controlled by a hydraulic valve situated at a convenient point safely removed from the danger zone.

The third furnace, which is in the plant of the Malleable Steel & Iron Co., Tacoma, Wash., is rated at 300 kilowatts and is adapted to making special grades of gray iron and semi-steel. Special castings heretofore unattainable on the Pacific coast are being produced at this plant. A second furnace will be installed, and when it is in operation, one unit will be employed for steel and the other for cast iron.
